UNITED STATES DEPARTMENT OF AGRICULTURE
Bureau of Agricultural Economics

CREDIT AND OTHER SERVICES FOR FARM HOUSING

Address by Roy J. Burroughs, Agricultural Economist,
at 23d Annual Agricultural Outlook Conference,
Washington, D. C., December 5, 1945

This paper concerns recent and pending changes in Federal laws affecting farm housing. These laws relate to credit and other services which may be used to improve farm housing. Reference also will be made to cooperative construction and building supply services.

Of course, many farmers can improve or build houses without benefit of credit. This is evident from a previous paper that emphasized the financial strength and current liquid position of the average farmer today. A favorable financial condition both enables farmers to do without credit and to get credit if they want it. Individuals, banks, insurance companies, and other lenders are available sources. Farmers in good financial condition also use the credit facilities of agencies of the Farm Credit Administration.

Farm Credit Administration

Until June of this year the Federal land banks were not in a position to provide much credit for construction purposes. Land bank loans were limited to 50 percent of the normal value of land plus 20 percent of the value of improvements. To illustrate, if land were valued at $7,000, improvements at $3,000, a loan of only $4,100 or 41 percent of the $10,000 valuation would have been possible.

A recent amendment to the Federal Farm Loan Act now permits Federal land banks to lend up to 65 percent of the normal value of a farm including improvements. 1/

This would allow a $6,500 loan secured by the $10,000 farm just cited. In many areas of the United States only the most select risks can obtain loans from other sources on terms comparable to those from the Federal land banks. Even the Commissioner loans of the Federal Farm Mortgage Corporation may not be available after next June. Hence land bank loans may be used to an increasing extent for improving and building farm housing.

Farm Tenant Act

Even though the average farmer may be in a strong financial position, hundreds of thousands of farmers have but meager resources. Many young and able farmers are in the tenant class - often without sufficient capital to

1/ Public Law 98, 79th Congress, approved June 30, 1945.

buy a farm of efficient size. By and large, the tenant houses in which such farmers live are inadequate. The present public policy to encourage farm and home ownership by the operators themselves undoubtedly contributes toward improved housing. The Bankhead-Jones Farm Tenant Act thus serves a public objective. 2/ At the end of 7 years of operation under this law the Farm Security Administration had financed about 15,000 new houses. About an equal number had been improved and repaired.

Pending legislation would not only permit tenants to use the loan funds for buying farms, but would authorize the use of funds by present owners for enlarging farms to an efficient size and for improving existing structures. 3/ If the liberalization of the law should be accompanied by increased appropriations for loan funds, the construction and improvement of farm houses undoubtedly would be stimulated. Whatever loan funds the Government fails to recover may be viewed as public contributions to the encouragement of home and farm ownership. Granted the policy, the loan program is a useful instrument.

Veterans' Benefits

Veterans in general, like many farm tenants, lack adequate financial resources to buy a farm home. The Servicemen's Readjustment Act of 1944 (the "GI Bill") includes provisions for a Federal guarantee of loans. 4/ Loans for farming operations, including the farm house, are eligible for the Federal guarantee. The Federal guarantee to a lender covers 50 percent of a loan provided the guaranteed portion does not exceed $2,000. Pending legislation would extend the allowable term of such loans from 25 to 40 years. 5/ It would also liberalize appraisal procedures.

As of October 27, 1945, according to the Veterans' Administration, 608 loans aggregating $707,225 had been approved for farm operations. Presumably some of this credit was used for housing.

General Housing Act of 1945

Pending before Congress is the much discussed General Housing Act of 1945. 6/ The bill is intended to benefit farmers in all financial circumstances. The sponsors are Senators Wagner, Ellender, and Taft. It therefore is a nonpartisan undertaking. The policy preamble to the bill begins as follows: "The Congress hereby declares that the general welfare and security of the Nation and the health and living standards of its people require a production of residential construction and related community development sufficient to remedy the serious cumulative housing shortage, to eliminate slums and blighted areas, to realize as soon as feasible the goal of a decent home and a suitable living environment for every American family, and to develop and redevelop communities so as to advance the growth and wealth of the Nation."

2/ Public Law 210, 75th Congress, approved June 22, 1937.
3/ S-1507, 79th Congress, introduced Oct. 23, 1945 by Senator Bankhead and H. R. 4768 by Mr. Flannagan.
4/ Public Law 346, 78th Congress, approved June 22, 1944.
5/ H. R. 3749, 79th Congress, introduced July 19, 1945 by Mr. Johnson of Colorado
6/ S-1592, introduced Nov. 14, 1945.

Probably all agree with the goal of establishing a decent home for every American family. Yet, it will no doubt be necessary to compromise differences over methods for implementing this policy. The Secretary of Agriculture has not yet indicated his position with reference to the bill.

Rural and farm housing is the subject of Title VIII of the bill. Credits, grants, and technical services of great importance to farm families are proposed. Of lesser importance to the future of farm housing is a provision for extending FHA mortgage insurance to existing farm real estate.

Under the direct loan authorizations, the Secretary of Agriculture would be authorized to make loans to owners of farms for the purpose of providing "decent, safe, and sanitary dwellings." This could be accomplished by construction, repair, alteration, or replacement of dwellings. Eligible occupants of such dwellings would be owners, tenants, share croppers, or laborers. Seasonal workers would be given facilities through loans to owners or groups of owners. Rentals of seasonal properties would have to be approved and prevailing wages would have to be paid to the seasonal occupants. Loans would be limited to owners of farms who "cannot elsewhere receive the necessary credit on comparable terms." Apparently, almost every farmer lacking adequate housing might be construed as eligible because the interest rate would be 3 percent, a rate rarely available from other sources. Loans could not exceed 40 years and so far as the law is concerned they could be junior liens. The amortization schedules would provide some flexibility since in good times prepayments would be required and in bad times reduced payments would be permitted.

Funds for this program would come from the RFC in such sums as might be appropriated from year to year.

Among other things such a loan program might be used to help stretch the funds for tenant purchases. Funds for the Bankhead-Jones program could provide the farm, and funds for the housing program, the house. The great administrative problem would be to restrict loans to the needy and at the same time assure that unprofitable farm enterprises would not be perpetuated.

The principal limiting factor on the volume of housing that would be built or improved under this law would be appropriations. Another limiting factor is that loan funds in and of themselves would not encourage landlords to build tenant housing. Some economic incentive is required. The proposed law would not increase such incentives. Yet farm tenants are the ones most in need of improved housing.

Another portion of Title VIII amends the United States Housing Act of 1937. It would authorize the Federal Public Housing Authority to make long-term loans and grants to local public agencies. These agencies would be expected to construct rental housing to families who have incomes so low that they would not benefit from the other program for loans to farm owners. Houses so built by local public agencies on farms would be rented to operators or laborers, with an option to purchase. Rentals would be adjusted from year to year according to family need and income. The Federal Government would make up any difference between the cost of providing housing and the amount

families can afford to pay. This would be done by annual contributions which may not exceed 50 million dollars per year. In time, if adequate funds were provided, such a program could unquestionably eliminate much of the unhealthful and indecent rural housing. Yet the grants would seem to be limited to subsidizing new construction. A greater number of houses could be made sanitary and livable more quickly were grants available for simple things like screens and shingles for existing houses.

Obviously, administrative and legal difficulties would be presented by a situation in which the house is made a separate property from the farm. But assuming that such difficulties could be overcome there would still remain a difficult task in determining conditions under which a local authority might construct new housing on a farm.

To farmers in all degrees of financial competence one of the most important provisions of the General Housing Act of 1945 is that establishing technical services. The Secretary of Agriculture would be authorized to furnish technical services either for a fee or free of charge. It would be possible to furnish the farmer with building plans, specifications, construction, supervision, and inspection, and to give other advice and information. Farmers who try to do their own remodeling or building would have competent direction. Farmers who hire their construction work would have adequate plans with which to start, would be able to obtain architectural supervision of the job at no more than reasonable fee, and would be assured adequate inspection.

This proposed service is of very great significance to banks and mortgage lenders of all types. It might even be possible for lenders to utilize the services of the Government architects to serve as inspectors of property before closing a loan. Such services would probably be available on a reimbursable basis.

The Department of Agriculture would indeed have an opportunity through such a program to contribute much toward rebuilding rural America. Time and money would be required to put this public service into full effect but a lot of farm houses actually would be repaired, remodeled, and built. All economic classes of farmers would be served.

The bill also would authorize technical research by the Department of Agriculture and the National Housing Agency in cooperation with each other. Facilities of State agencies and educational institutions might also be employed. Such a program might do much to accelerate the technical revolution that may be pending in the construction field. Factory-built panels which can be combined into houses with a large variety of sizes and designs already are being built. Substantial reductions in cost await volume production and the creation of an economical and fully integrated marketing system. The proposed housing bill treats only credit and technical services for housing. It would not influence marketing costs.

Cooperative Construction Service

The development of improved marketing services may be the contribution of farmers cooperative purchasing and supply associations. Some such associations and their federated regional organizations have made a start in this direction. Many purchasing associations of farmers now sell certain building supplies such as cement, plaster board, and metal siding. The Farmers Union Grain Terminal Association of Minneapolis operates a chain of lumber yards. Several regional associations hold controlling interest in a shingle mill situated in British Columbia. The Fruit Growers Supply Company has a new investment of about 11 million dollars in sawmills and timber in California. The Indiana Farm Bureau Federation owns three lumber mills in Arkansas, together with timber acreage. In Indiana, farm service shops operated by cooperatives are not only repairing farm and household equipment but are even building houses. The Ohio Farm Bureau Federation is moving in the same direction.

The cooperatives appear to be moving toward a fuller integration and rationalization of supply and construction services. Within the next decade or so there is the possibility that a Nation-wide farmers' cooperative construction service may be developed.

Rural Electrification

A discourse on services for housing would not be complete without reference to the work of the Rural Electrification Administration. Electrification greatly improves the livability of a house.

The Rural Electrification Administration is laying plans to make central station electricity available to every farm in the United States. It is doing this by providing ample credit at low interest rates to farmers cooperative utility associations. The satisfaction gained from living in farm housing will be greatly augmented by this program.

Conslusion

The improvement of farm housing cannot be achieved by any one approach. Let loan funds be advanced on a liberal basis to those able to repay the loans but at rates sufficient to cover all costs. Let help by way of credit be given to those who cannot quite pay the full cost of covering the credit risk. But in so doing let there be care not to subsidize uneconomic production nor to discourage thrift and savings. Subsidies to improve the consumption standards of low-income groups may be justified by the improvement to national welfare. On the other hand, subsidies that perpetuate a weak production economy are a waste to any people. Finally let there be a minimum standard of farm housing in each part of the country below which it is not necessary for farm families to fall. But let progress be accomplished democratically without labeling the less fortunate as paupers. There will still be plenty of incentive to full productivity if people are encouraged to want the things that hard work can bring.

UNITED STATES DEPARTMENT OF AGRICULTURE
Bureau of Agricultural Economics

STATE AND LOCAL HOUSING PROGRAMS

Address by Lucile W. Reynolds, Family Economics Division, Bureau of Human Nutrition and Home Economics, at the 23rd Annual Agricultural Outlook Conference, Washington, D. C., December 5, 1945

As a means of measuring the undoubted need for better rural housing, the Interbureau Committee on Postwar Programs chose four measures. They were (1) the value of farm dwellings, (2) the size of farmhouses and farm families, (3) the sanitary equipment in rural homes, and (4) the condition of the houses and repairs needed. Here are a few figures from this report. Between 1930 and 1940, the value of dwellings decreased 20 percent. In 1940 for the country as a whole, the median value of owner-occupied farmhouses was $1,028. For the North, the median was $1,450, for the West, $1,084 but in the South it was only $600.

Overcrowding was more general in rural farm than in urban homes. In 16 out of every 100 farm dwellings there were more than 1.5 persons per room. Twenty-five out of every 100 dwellings had three rooms or less. Only 18 percent had running water in the house while slightly more than one-fourth had a kitchen sink with drain. Nearly 27 percent had no screens. Ten percent lacked a privy of any kind.

Farmhouses were in a bad state of repair in 1940. Although 34 percent were reported as needing major repairs during the 12 months previous, more than three-fourths of the families reported no expenditures for the upkeep of their dwellings.

There are many evidences that housing improvement ranks high on the postwar plans of farm families. Housing improvement has always had some attention in the Extension program. With a few exceptions, the chief developments have been along the lines of kitchen improvement, an activity for which home economics extension workers have assumed major responsibility. A great deal of credit is due them for the results so far achieved.

During the last 12 months there have been many evidences of a quickened interest in housing improvement on the part of extension workers, both men and women. It has been recognized that a training program is essential both for the extension specialists and supervisory staff and for the county extension agents.

In some respects, it is fortunate that construction materials are not immediately available. Families are having a little more time for planning before they go into the market to buy, and educational agencies are having time to do some "retooling" for their postwar responsibilities in this field.

The training programs from a number of States emphasize the following things: (1) Housing improvement as a part of the long-time farm and home financial plans. (2) Designs of low-cost functional houses for families. (3) Repair and remodelling of old houses. (4) Reducing the cost of farm housing through the use of native materials, through providing training for farm owners in the skills needed in house construction, repair, and upkeep. (5) Information as to new materials of construction, new appliances.

Following are a few examples of the training programs that have been held to date: A conference on farm home remodelling for extension specialists in home management and agricultural engineering in six New England States was held early in November. This is now being followed up by conferences for extension agents in the States in that region.

Several States have held a series of 2-day training conferences for county extension agents--men and women. Among them are North Carolina, Missouri, Iowa, and Minnesota. Other States as Alabama, Maine, and Minnesota have had training conferences for home demonstration agents. In Maine, club agents were included.

Illinois held a series of training conferences on farm building problems for county agricultural agents earlier in the year. A parallel series on farm housing and facilities is to be held in January for home demonstration agents. In a number of other States, similar training conferences are to be held early in 1946. A few States have started training programs in housing for local volunteer leaders.

In order to learn of housing plans of farm families in their States, Alabama and Virginia have circulated a questionnaire among Extension cooperators. Preliminary returns reveal that families have ambitious plans for housing improvement as soon as materials become available and they indicate that an educational program in housing is one of the most urgent needs.

A number of States have published supporting material for a housing program. Thus, the Iowa extension service has reprinted a series of articles on "How to Plan Those Farm and Home Improvements" which appeared in the Iowa Farm Economist. The leading article by Carl Malone, "Investing for Tomorrow" sets the stage for the others.

Alabama has published two 8-page circulars--one on rural house planning, new construction, and one on rural house planning, remodelling, by the specialist in farm buildings and grounds and the extension specialist in home management. In each, a series of practical questions is posed, each question is followed by a brief discussion.

A number of States have published excellent illustrated bulletins on home storage and on kitchen arrangement. The titles are listed in the references on the farmhouse recently issued by the library of the U. S. Department of Agriculture.

In some communities a marked interest in housing has developed. In Tyrrell County, N. C., for example, a cooperative housing program is in progress. It is an outgrowth of a cooperative program among the Negroes of that county which started in 1939 with a savings club and later developed into the "Lights of Tyrrell Credit Union."

A cooperative sawmill provides lumber. The families work in groups of five, cutting trees and sawing them into boards. Before the United States entered the war, 15 houses had been completed. The work is done on Saturdays and holidays. When building operations can be resumed, the group plans to hire a carpenter to teach the older boys and to supervise the construction of other new homes. If electricity becomes available, the group plans to engage an electrician to teach and to supervise wiring.

Augusta County in Virginia has a planning board that is concerning itself with county postwar plans. A recent survey made by this agency revealed that the residents of the county expect to build 800 new homes in the next 2 years, while 2,500 families intend to make repairs and improvements, and farmers plan to build some 375 barns and outbuildings. The survey also indicates the number of families that expect to buy refrigerators, washing machines, and radios. According to this report, families expect that two-thirds of the costs of these improvements will come from war savings and from credit based on these savings, and one-third from current income. In this county, one-half of the liquid savings are reported to be in the hands of about 3 percent of the families; one-fifth of the families report no savings. Factual material of this nature provided by local people provides a good background against which to project a housing program.

As a background for an effective educational program in any field, facts are needed. Todate, there has been relatively little research in rural housing and the results of some that has been done have not been made available.

One promising source of facts is the North Central Coordinating Committee. In 1944, Agricultural Experiment Stations in 14 States in the North Central Region, in cooperation with the U. S. Department of Agriculture, organized a North Central Farm Structures Coordinating Committee, which has undertaken the publication of a series of bulletins concerning farm building. One of these, now in the process of being assembled, will bring together existing information about planning farm homes.

The Bureau of Human Nutrition and Home Economics has initiated some research on farm family needs and preferences for housing. It is being carried on in cooperation with State experiment stations. Data are being secured from families as to storage needs and space requirements for various activities. Special attention is being given to facts needed for designing kitchen storage; however, valuable facts for designing houses as a whole should emerge. Rhode Island, Maine, Kansas, Nebraska, California, and Washington are cooperating in the study.

Oregon State College has pioneered in housing research as has the University of Arkansas. You are all familiar with publications emanating from the experiment stations in these two institutions. Maud Wilson has had charge of the research in Oregon. Mr. Carter, who was responsible for several valuable Arkansas publications, is now at the University of Illinois and is active in the work of the North Central Farm Structures Committee.

It would be helpful if States had some case studies which would reveal how farm families with modest incomes through the years have achieved satisfactory housing. Did they develop a long-time home-improvement program early in their married life and work out segments of it from time to time? Or did they accumulate a large fund for use in one year? How were they able to finance it, and pay for their farms and educate their children at the same time? Did they use native materials from their own farms? Did they have special skills and so were able to use their own labor in building? It should not be too difficult to get some information of this nature and it would be very useful in an educational program. Another potential source of useful information is that provided by the Farm Security Administration. If the experiences of that agency in the housing field could be brought together, the summary should be very useful in all future housing programs with farm people.

One phase of the housing improvement program that has had relatively little attention from workers in the field of rural housing is that dealing with the matter of minimum standards. For several years minimum standards for housing have existed in cities. They relate to many things including construction, facilities, sanitation and degree of crowding. Certain of the standards--those relating to health, safety, and morals--are mandatory. These latter are under the jurisdiction of departments of public health.

Minimum standards of adequacy for farm housing is a more recent development. In October 1941, the U. S. Department of Agriculture issued a circular dealing with this problem. It is known as Circular 475, Minimum Requirements for Farmhouses. Included under minimum requirements are such items as (1) a well-drained site which permits the safe disposal of all refuse, (2) convenient supply of good water, (3) windows adequate in area and location to provide for light and ventilation, (4) a heater in addition to the kitchen stove, (5) suitable space including three bedrooms in order to provide for children of both sexes, (6) adequate storage space for clothes, bedding, kitchen utensils and food, (7) labor-saving and sanitary facilities including a built-in sink with drain in the kitchen and water either piped to the sink or made available from a pump adjacent to the work porch, (8) a sanitary outdoor toilet provided to meet the specifications set up by the Public Health Service and/or local health authorities, (9) these standards recommend that houses be wired where electric service is available or is likely to be extended within a reasonable time and also that a fully equipped bathroom be provided if at all possible or at least space be provided for a future installation, (10) construction features should be such as to produce a house that will be usable for 30 years or more without excessive maintenance, (11) certain details of construction are spelled out as, roof tight to water at all seasons, tight floors and walls, insulated ceiling, windows and doors screened, flue area inside the chimney of specified size for heater and range.

More recently the Farm Security Administration has set up tentative minimum standards for housing, which it uses as a guide in administering the Farm Ownership Program. These standards are used in appraising houses on farms being purchased by Farm Ownership borrowers and in putting these houses in condition for occupancy.

FSA standards appear to be designed to conform to generally accepted minimum standards for healthful living, reduction of accidents, and protection against fires. They are similar to the requirements set forth in Circular 475 but fewer details are given in the standards. Kitchens are to be "properly equipped with sinks," but nothing is said about a drain for carrying away waste. "There should be adequate provision for storing clothing" but there are no details as to the minimum number of closets that would be considered acceptable. "Sleeping quarters should be adequate to meet family needs," but no mention is made of the minimum number of bedrooms. It is intended that members of the FSA staff in regional and State offices, county supervisors, and local committees will define these standards more precisely in terms of the prevailing standards in the area and in the local community. It is assumed that the health standards will meet the requirements of States in which the loans are made.

A third statement on the subject of standards was issued by the U. S. Department of Agriculture in July 1944. It was prepared by the working group on housing of the Interbureau Committee on Postwar Programs. It is entitled, "Proposed Minimum Adequate Standards for the Farm Dwelling to be Located on an Adequate Farm." These suggestions were developed as the basis for discussion by regional and State groups interested in the problems of farm housing. As suggested by the title, these standards envisage more than the minimum already described. Occupancy standards are suggested, the minimum size of rooms is given, the basic equipment of the kitchen and bathroom is listed, modern plumbing facilities are assumed. It must be remembered that they are standards for the farm dwelling to be located on adequate units.

What is your opinion of these standards? Are they too high or too low? In connection with an educational program in housing, is it desirable to set up such standards? If so, who should share in setting them? Technical workers of the U. S. Department of Agriculture? Technical workers in the States or counties? Should rural people participate in setting their own standards?

If you agree that this last is desirable, you would probably also agree that before local people are ready to do this they will need to become familiar with significant facts about the existing housing of farm families in their own county. Much of this information can be found in the 1940 census of housing. This can be supplemented by information collected by such agencies and individuals as Extension agents, local chambers of commerce, vocational agricultural and homemaking teachers, the Rural Electrification Administration representative in the area, and the rural people themselves.

An analysis of these facts will indicate specific things that need to be done to raise the level of housing of all farm families in the county and will suggest what it will be desirable to include in the standards.

An educational program in housing growing out of a thoughtful analysis of existing conditions by the people themselves and based on minimum standards of adequacy which they have agreed are desirable and attainable, has great potentialities for being successful. Such an approach should make it possible to enlist the cooperation of other educational and action agencies in the county, as well as commercial and business interests and citizens generally, in developing and carrying out an educational program in this field. But if it is to succeed, it will take the combined efforts of all extension agents in the county, both men and women, and the assistance of extension specialists in farm and home management, agricultural engineering, rural sociology, forestry and landscaping, as well as members of the supervisory staff.

Much of the housing-improvement work now in process or about to be initiated is with farm owners. It may be fruitful to speculate on the effect which the establishment of minimum standards of adequacy by the people themselves as a phase of their educational program might have on the improvement of tenant housing in farming areas. In a special analysis of the data on farm housing in the 1940 census, farm dwellings were classified into three groups on the basis of their size and value--acceptable, repairable, non-repairable.

It was found that half of the tenant-occupied as compared with about one-fourth of owner-occupied were in the non-repairable group. Only about one-sixth of tenant dwellings were classified as "acceptable," as compared with nearly half of owner's houses. About half as many tenants as owner's families had such conveniences as running water, flush toilet, and electric lights.

There are several other matters of concern to all of us interested in the problems of improved housing. There is time to list only a few of them.

1. How to lower the cost of building through the use of new materials, new building procedures, pooling of skills and of purchases, use of native material.

2. Effective ways of helping all families get the most for their housing money.

3. How to make provision in the housing program for the needs of families who have only a very little money to spend, but who want to improve their housing.

4. How to provide better tenure arrangements and secure the general adoption of a type of farm lease that will provide for reimbursing tenant families for structural improvements made by them on the dwellings they occupy.

5. How to provide for closer cooperation with local and State departments of health in problems relating to health and sanitation of farm dwellings.

6. How to provide an opportunity for an exchange in point of view between farm families interested in more liveable houses at minimum cost and carpenter-builders, masons, and other skilled workers, who will do the technical work.

7. Necessity for keeping an open mind toward new materials of construction, new processes, new features of design, that promise to reduce costs and add to the liveability of houses.

As everyone ralizes, the goal of better farm housing can be achieved only if farming as a business is successful. This point of view is well expressed by the housing sub-committee of the Interbureau Committee on Postwar Problems in the following statement: "It is recognized that the dwellings are integral part of the farm economy. Efforts to improve farm housing should not be limited to housing as such, but should be accompanied by efforts to improve the farmer's economic situation by such measures as farm enlargement, land improvement, better methods of management, improved tenure arrangements stimulating off-farm income and retraining for other occupations."

UNITED STATES DEPARTMENT OF AGRICULTURE
Bureau of Agricultural Economics

TRENDS IN FARM INCOME AND TENURE AND THEIR RELATION TO FARM HOME IMPROVEMENT

Address by John C. Ellickson, Bureau of Agricultural Economics, United States Department of Agriculture, at the 24th Annual Agricultural Outlook Conference, Washington, D. C., October 10, 1946.

Comparatively low levels of income to persons living on farms has been an important, but not the only, reason why many farm families have been living in houses that were overcrowded, in need of repair, and lacking such modern facilities as electricity and running water. Farm tenancy is another contributing factor. Tenant-occupied dwellings on farms were greatly inferior to those occupied by owners, in contrast to the comparatively little difference by tenure in urban areas. Presumably this is because the farm house usually goes with the farm or job. On many farms, the condition of the house does not greatly affect the amount of cash or share rent paid. This is especially true when there is considerable competition among tenants for farms or among farm laborers for jobs. For this reason, landlords usually have had little economic incentive to invest in a new dwelling or improve the old one. And even if the renters included here (tenant farm operators, farm laborers, or other persons living on farms) had incomes and savings sufficient to finance home improvements they usually have had little inclination to spend money on another person's property.

Since pre-war years the volume of farm production has increased by roughly one-third, with considerable variation between regions and States. Prices have approximately doubled, with wide variations by commodities. As a result gross farm income is currently about two and a half times as high as in the immediate pre-war years. Wage rates and opportunities for off-farm work have also increased. Some of the effects of these changes are shown by the following selected items from the June and August, 1946 "Farm Income Situation."

Table I. Estimated Cash Receipts from Farm Marketings and Net Income to Persons Living on Farms, for the United States, 1940 to 1945: BAE

Year	Cash Receipts from farm marketings	Net Income to Persons on Farms: Total	From agricultural sources	From non-agricultural sources
	(In billions of dollars)			
1940	8.3	7.9	5.5	2.4
1944	20.2	18.1	14.0	4.0
1945	20.8	18.7	14.7	4.0
1946	23.0 1/	-	-	-
1947	22.0 1/	-	-	-

1/ Outlook forecast.

By 1945 net income from agricultural sources to persons on farms had increased to more than two and a half times the 1940 level. The increase in real income was considerably less because of higher living costs. Income from non-agricultural sources increased more slowly. Such income (wages and salaries for non-farm work, interest, pensions, etc.) is much more important in industrialized States like Massachusetts and West Virginia than in those where agriculture is predominant, like Mississippi or North Dakota, but for the nation as a whole most of the income to persons living on farms is derived from agriculture.

Preliminary reports from the 1945 Census of Agriculture show that the number and proportion of farm owners has increased since 1940. This continues the reversal since 1930 of a long decline in the proportion of owned farms as shown in the following table:

Table II. Number of Farms, and Number and Percent of Farm Owners, for the United States, 1900 to 1945: Census of Agriculture.

Year	Total Farms (000)	Total Owners (000)	Proportion of owners (Percent)
1900	5,737	3,653	64
1910	6,362	3,949	62
1920	6,448	3,925	61
1930	6,289	3,568	57
1940	6,097	3,699	61
1945 1/	5,877	3,940	67

1/ Preliminary.

One important point to be noted from the above table is the significant decline in the total number of farms since 1920. By 1910 the settlement of this country had been substantially completed and the changes reported since that time have been more in the nature of internal adjustments within the total farm plant rather than an extension into unsettled areas. Some of these adjustments are indicated by an apparent increase in the number of Census farms reporting a low (under $250 at 1939 prices) or comparatively high ($1,500 and over at 1939 prices) value of product, with a consequent decline in the total number reporting intermediate values of product. There is a general tendency, with regional exceptions, for the proportion of owners to be highest in the low value-of-product group, probably due in part to the fact that it is more difficult to collect rent from farms with little marketable production. There are some indications that a disproportionate share of the increase in farm ownership since 1940 has occurred on the smaller farms. However, we will have to wait for cross

tabulations from the Census before we can be sure of what has happened on the farms productive enough to decently support a farm family without income from nonfarm sources.

On the basis of analysis of Census data and information from other sources it has been estimated that under 1939 conditions a total value of product per farm (sold or used in the farm household) of about $1,500 was barely sufficient to support a family, including acceptable housing, without other income. According to this estimate, there were about 1.5 million farms of this economic size in 1940. It was further estimated that on approximately a million additional farms the lower volume of production combined with work off farm by the operator provided an equivalent minimum income for family living, including housing.

From the 1940 Census of Housing all rural-farm occupied dwellings were grouped into three classes, as follows:

Acceptable: All dwellings with 5 or more rooms and valued at $1,000 and over, or renting for $10 a month and over.

Repairable: All dwellings of 3 or 4 rooms valued at $500 or more, and larger dwellings valued at $500 to $999, or equivalent rent.

Non-Repairable: All 1- or 2-room dwellings and all larger dwellings valued at less than $500 or renting for less than $5 a month.

Some differences between the condition of the dwellings in these classes are indicated by the fact that two-thirds of the acceptable dwellings were lighted by electricity as compared with only 7 percent of the non-repairable. For running water the figures were 43 and 2 percent, respectively. Differences in the extent of overcrowding are not now available, no doubt there would be differences here too since there is a low correlation between the number of persons in the household and the number of rooms in the dwelling.

With the preceding classifications of farm operator incomes to owners and tenants, and classes of dwellings, it was possible to relate them as shown in the following table adapted from a joint study made by the Bureau of the Census and the Bureau of Agricultural Economics. A more detailed analysis by the U.S.D.A. Interbureau Committee on Post-War Programs may be found: U. S. Congress. Senate Special Committee on Post-War Economic Policy and Planning. Hearings . . . Pursuant to S. Res. 33, . . . Part 12, Housing and Urban Redevelopment, January 17, 1945, pp. 1895-1901.

Table III. Estimated Number and Condition of Occupied Farm-Operator Dwellings on Farms, Related to Adequacy of Farm and Off-Farm Employment to Finance an Acceptable Dwelling, for the United States, April 1940.

Farm and Off-Farm Employment Income is Estimated to be:	Class and Number of Farm-Operator Dwellings on Farms			
	Total	Acceptable	Repairable	Non-Repairable
	(all numbers in thousands)			
Total	5,760	2,060	1,700	2,000
Sufficient to finance an acceptable dwelling	2,560	1,500	660	400
Not sufficient to finance an acceptable dwelling	3,200	560	1,040	1,600

As might be expected, the preceding table shows that the quality of farm housing corresponds in general with the opportunities for effective employment on or off the farm. According to these estimates less than half (2,560,000) of the farm operators had adequate incomes. Of these nearly three-fifths lived in acceptable dwellings. In contrast, one-half of the 3,200,000 farm operators with inadequate earned incomes lived in non-repairable houses. Under 1939 conditions it appears that lack of income was the chief limiting factor in the improvement of farm homes. An indication of the change that has taken place since that time is shown in the following table, based on a sample survey by the Bureau of the Census in November, 1945.

Table IV. Rural-Farm Occupied Dwelling Units, by Tenure, for the United States, 1940 and 1945; from the Census.

Tenure	Estimated Number (in thousands)		Increase, 1940 to 1945	
	1940	1945	Number (000)	Percent
Total	7,107	6,319	-788	-11
Owners	3,783	4,131	348	9
Tenants	3,324	2,188	-1,136	-34

Table IV shows changes in the tenure of rural farm dwellings in the same direction as Table II preceding, a moderate increase in the number of owners and a larger decrease in the number of tenants. The numbers involved are not directly comparable, because of differences in definitions used by the Census of Agriculture and of the Censuses of Housing and Population. However, it appears likely that a disproportionate share of the decrease in the number of families on farms from 1940 to 1945 occurred in the non-operator households (farm laborers, domestic help, etc.) most of whom lived in tenant-occupied dwellings. These families were even worse housed than the second group of operators (those with inadequate incomes) shown in Table III. It would appear then that it was primarily the lower grade of dwellings on farms that were vacated in the migration from farms since 1940.

This indication is corroborated by the following table, also adapted from the November, 1945 sample survey of the Bureau of the Census:

Table V. Rural-Farm Occupied Dwelling Units, by Number of Rooms, for the United States, 1940 and 1945.

Number of Rooms	Estimated Number		Change, 1940 to 1945	
	1940	1945	Number	Percent
	(all numbers in thousands)			
Total	7,107	6,319	-788	-11
1 to 4 rooms	3,221	2,503	-718	-22
5 or more rooms	3,886	3,816	-70	-2

At first sight an improvement in the condition of farm housing by migration from the lower grade dwellings seems to be a negative rather than a constructive approach to the problem. But in overall terms, this migration has increased the land resources and other employment opportunities for the families remaining on the land, and therefore has increased their potential capacity to afford better housing.

In most cases farm houses are built or improved by and for a family from the income and capital available to them. In spite of the great improvement in farm incomes since 1940 and the migration from farms it is my opinion that all of the war time changes have eliminated no more than half of the Census farms which in 1940 were unable to support adequate housing. Under conditions of full employment the reduction in the number of inadequate farms should continue.

In conclusion, it should be kept in mind that tenure seems to be second only to income as a problem in improving farm housing. Even with adequate incomes there will continue to be many cases in which the landlord cannot expect enough additional rent to justify a considerable investment in housing. This is another way of saying that some tenants will be unwilling to pay enough more rent for a farm with a better house. This situation can be improved by a program of education, but to what extent I leave with you.

TRENDS IN FARM FAMILY LEVELS AND STANDARDS OF LIVING

PERCENTAGE OF FARM OPERATORS REPORTING SPECIFIED FAMILY LIVING ITEMS, UNITED STATES, 1920-45

SOURCE: SEE TABLES 13-18 IN APPENDIX

U. S. DEPARTMENT OF AGRICULTURE NEG. 46461 BUREAU OF AGRICULTURAL ECONOMICS

United States Department of Agriculture
Bureau of Agricultural Economics
Washington, D. C.
August, 1947

This publication is intended to be useful to all who are actively concerned with the welfare of farm families in America. The trends and present conditions in the levels and standards of living of farm families are presented as completely as available data permit. The materials are of value to extension workers and other adult educators, agency representatives, agricultural economists, rural sociologists, home economists, and those farm people and rural leaders who are concerned with the welfare that farm people derive from agriculture. For the technical reader this report should provide points of departure for a more intensive analysis of the factors affecting the living conditions of farm families.

TRENDS IN FARM FAMILY LEVELS AND STANDARDS OF LIVING 1/

Edgar A. Schuler and Rachel Rowe Swiger

INTRODUCTION

To improve the level of living of farm people is the final objective of official agricultural and rural life agencies. It is certainly the prime objective of farm people themselves. To what extent and in what ways this objective has been, is being, and in the future can be accomplished are questions that cannot be answered until there are ways by which to measure farm levels of living.

A level of living consists of those goods and services which people habitually have and use in their day-by-day living. It includes the entire range of things and services that contribute to the survival, protection, convenience, and enjoyment of individuals either alone, in the family, or in larger groups. But patterns of living differ tremendously from society to society; we are concerned primarily with those of our own society. What, then, is included in the level of living in the United States?

First of all, it includes such items as food, shelter, clothing, and medical care — matters which have genuine survival value, and are the "necessities of life" everywhere in the world.

Second, it includes the use of such conveniences as household furnishings, labor-saving devices and equipment; the services of professional people other than doctors; the agencies of personal care; isolation-reducing agents such as reading matter, the radio, the telephone, the automobile, postal service, good highways, the railroad, the bus, and other types of public transportation and communication.

Third, it includes such facilities as schools, hospitals, churches, recreation centers, which meet the needs of groups larger than the family, and business establishments serving a variety of specialized needs.

Fourth, it includes the amount and distribution of time left for leisure, recreation, and self-improvement activities, after the expenditures of such physical and mental effort as are required to supply the desired goods and services.

Fifth, it comprises the basic values, freedoms, or beliefs by which people live and for which, if need be, they are willing to die. For us, as Americans, these values are spelled out in such historic documents as the Declaration of Independence, and the Constitution of the United States, including the Bill of Rights and later amendments to the Constitution.

Sixth, it includes the degree of assurance that these goods, services, and rights will continue to be enjoyed in spite of illness, adversity, and advancing age.

1/ Revised by Walter C. McKain, Jr., Bureau of Agricultural Economics, to incorporate information contained in the 1945 Census of Agriculture.

Finally, and most distinctively American, it includes the opportunity for improvement of one's own lot and the opportunity for still further progress for one's children.

Many families or individuals may not have all they want or may not be able to enjoy fully all of the components of a level of living outlined above, either because they cannot afford some goods and services or because these things are inaccessible. To the extent that people's reasonable aspirations go beyond the goods and services at their disposal, to that extent does their standard exceed their level of living. Standards of living when defined as "aspirations" may seem somewhat nebulous. But it is probably safe to assume that, in our society, generally speaking, the standard of living of most people and most families is about the same as the highest level of living of those with whom they come in substantial contact. To the degree that this assumption is correct we can learn much about standards of living and how they may be changing by a study of trends in levels of living, especially at different income levels.

Need for Measures

Only by developing appropriate measures of the level of living and applying them time after time can we be sure of the extent to which farmers' levels of living are improving or deteriorating. Perhaps it is not too much to hope that objective yardsticks can soon be developed which will enable us to tell just where, and for what proportions of the population, and in what respects, "American standards" are being met or not being met. Before highways or railroads can be built it is necessary to survey and plot elevations and contours to determine where cuts and fills must be made. Even though the analogy is not perfect, it seems reasonable to say that it is essential to determine by objective measures the low spots in the profile of the level of living if public and private welfare agencies are to fill them in and thus make something resembling an even level.

So far as such items as radios, telephones, automobiles, refrigerators, and washing machines are concerned — the kinds of gadgets and mechanical conveniences in which the American's way of living is so far beyond the rest of the world — it is a fairly simple matter to enumerate samples of the population and tell, with sufficient accuracy for most purposes, just what the present situation is. Through the Census of Agriculture, every 5 years, and the decennial Census of population and other subjects complete enumerations can be made. If comparable data are collected, the trends can be plotted. But while it may be much easier to count radios and washing machines than to develop similar yardsticks for the measurement of adequacy of nutrition, or need for health services, or degree of isolation, it is no less essential that ways and means be developed for measuring such matters in order to be able to get a well-rounded picture of what is happening to the total pattern of living. It is necessary, therefore, to expand the range of types of measures at our command so that we shall be able to tell whether and in what respects material advances are accompanied by corresponding gains or losses in other phases of living.

Data are available for only a small number of goods and services used by farm families, and most of them for only a short period. The following

table indicates the type of items for which data are available for specified periods, and the sources. There is not always complete comparability of data from period to period, but the exceptions are indicated in the text accompanying charts and tables.

Table 1.- Level-of-living items in farm households for which information is available by source and years of availability.

17. Organization membership	-	-	-		X

1/ The Quarterly Survey of Agriculture is a project designed to give a national picture of the significant developments taking place on farms in the United States. For further information on the Quarterly Survey of Agriculture see Appendix. (See page 27.)

If data were available in Census reports back to 1920 on all items obtained in the Quarterly Survey of Agriculture in 1945, it would be possible to learn a great deal about what has happened to large segments of farm families' levels of living during the last 25 years. Only if these data can be secured at periodic intervals in the future will it be possible to know in what ways and to what extent farmers' levels of living are improving or deteriorating.

An adequate current measure of farmers' level of living will require additional data on such matters as food consumed, clothing, sanitation, recreation and self-improvement activities, and security. Numerous studies, of which the Consumer Purchases Study is the most exhaustive, and Rural Family Spending and Saving in Wartime is the most recent, have provided invaluable information on some phases of these problems. 2/ The need is great for current national and regional data collected regularly and at reasonably frequent intervals.

2/ Consumer Purchase Study, U. S. D. A. in cooperation with Work Projects Adm. 1939-41. Rural Family Spending and Saving in Wartime, USDA, June, '43

Accordingly this report constitutes what is hoped will be the first in a series of periodic reports that will measure with increasing accuracy and completeness the changing levels and standards of living of farm people in this country.

ESTABLISHED TIME SERIES

It is common knowledge that significant technical improvements have been taking place on our farms during the last quarter century. No one will deny that the changes that have taken place in such items as electricity, running water, telephones, automobiles, and radios have greatly affected the welfare of farm people. Much of the drudgery and loneliness of many thousands of farm families have been modified since 1920 through the enjoyment of these widely diffused conveniences.

Changes that have taken place in the proportions of farm families having certain items during the past 25 years are summarized graphically in the figure which appears on the cover. In the charts and tables presenting individual items, regional comparisons have been limited to the three major Census regions — the North, the South, and the West. 3/

In the regional comparisons the North is generally in the position of having the highest proportion of farm operators with preferred items, although the West leads in several items. The South is lowest in the regional comparisons. When the regions are compared with regards to changes between 1940 and 1945 the West most often shows the fastest rate of increase.

Available information does not permit drawing definite conclusions about the causes of the changes that have occurred regarding specific items. It should be pointed out, as a general caution to the reader, that the data dealt with throughout this report are proportions of farms, farm operators, or their families, rather than absolute numbers. Any selective type of increase or decrease of farms, therefore, may be partly responsible for the observed percentage changes with regard to various items. For example, if the wartime migration of farm families to industrial centers included disproportionately large numbers of families moving from houses designated as poor there would be a percentage increase of good houses even though no new construction had taken place. Recognition of this possibility may help a reader to avoid drawing unwarranted inferences from these data.

3/ See Figure 15, Appendix, p. 26.

Figure 2

Electricity

The steeply climbing curve of farm operators' dwellings lighted by electricity shows how valuable this item is to farm people. (Fig. 2) Its importance in their standard of living should not be underestimated. Electricity means more than home lighting. It is a basis for the multitude of appliances that make housework easier and more efficient. Refrigerators, washing machines, self-heating irons, modern radios, and many other items are directly related to the presence of electricity in farm homes.

The proportion of farm homes lighted by electricity has increased in each decade since 1920. There are now nearly 7 times as many farm homes with electricity as there were in 1920. Even under wartime conditions electrification was extended to some farm homes. The need for labor saving machinery to meet the demand for increased production of food and fiber was partly responsible for the gains made in electrification since 1940.

Although there are marked variations in the proportion of farm homes lighted by electricity region by region, every section of the country has made progress in this direction. Nearly a third of the farm homes in the South have electricity today, or 8 times as many as in 1930. In the North 61 percent of the farms report electricity, which is a threefold increase over 1930. The proportion of western farm homes with electricity has doubled since 1930, so that nearly three-fourths of them now have electricity.

Figure 3

Running Water

Less than a third of the farm families in the United States have water piped into the house. Unlike electricity, which is usually a community development, running water almost always entails considerable individual expense. Wells must usually be dug and pressure must be established before water can be piped into a farm dwelling. Availability of electricity makes possible the installation of electric pumps, so it is not surprising to find that in 1945 only 6 percent of the farms not reporting electricity had running water. Bath tubs, showers, and flush toilets may add to the convenience and health of the farm families who have water piped into the house.

There was a considerable increase in the possession of dwelling units with running water from 1920 to 1945, and particularly since 1940, in all parts of the country. The rate of increase has not been so marked as in the case of electricity. Nearly two-thirds of the farm homes in the West have running water but less than one dwelling out of five has this convenience in the South. It should be noted that the proportion of farms in the South reporting running water more than doubled between 1940 and 1945.

Figure 4

Telephones

About a third of the farms in the United States reported a telephone in 1945. For many farm families, the possession of a telephone is considered a luxury. Families who can afford a telephone are usually able to have many other conveniences. Density of population is related to telephone service as many farm families living in sparsely settled areas are unlikely to have telephones.

Actually a larger proportion of farms reported telephones in 1920 than in 1945. A substantial decline in rural-telephone subscribers is found between 1920 and 1930 and a gain between 1930 and 1940. No other item in the level of living analyzed in this report shows a trend like this. Depressed agricultural incomes during the period may have forced farm families to curtail expenses. An upward movement in the curve took place between 1940 and 1945 but the gain was lower than the gain for electricity, running water, and other items.

More than half the farms in the North reported telephones in 1945. Only an eighth of the farms in the South had telephones that year. About 4 out of every 10 farms in the West reported telephones.

Figure 5

Automobiles

The convenience and the economic advantages of an automobile are appreciated by all of our farmers and their families. In 1945 nearly 2 out of every 3 farms reported the possession of a car. Distance between farm and city has been virtually reduced as more farm families acquire automobiles and as more good roads are built.

The proportion of farmers with automobiles increased between 1940 and 1945. Despite a nation wide shortage of cars and gasoline and parts during the war farmers generally were able to keep their cars in operation or replace them. In some instances members of the families who were working in defense plants needed transportation. The largest increase in automobiles in rural areas occurred between 1920 and 1930. During the thirties no gain was recorded in the proportion of farmers who had them.

In the North and the West about 4 out of every 5 farmers had an automobile in 1945. In the South only half as many farms reported a car, but between 1920 and 1945 the proportion of Southern farms with automobiles had increased threefold. During the same period the proportion of farms with automobiles in the North and West did not quite double.

Figure 6

Farms Located on All-Weather Roads

Nearly two-thirds of the farms were located on hard-surfaced roads by 1945. The increase in the use of cars, motor trucks, school buses and other automotive vehicles has made improved roads a necessity. Thus between 1925 and 1940 the proportion of farms on all-weather roads doubled. Added to that, a 30-percent increase was recorded for the period 1940-45.

Slight variations are found between regions relative to this item. About two-thirds of farms in the North and West were on hard-surfaced roads in 1945 while less than two-thirds of the farms in the South were located on all-weather roads, but between 1940 and 1945 the proportion of farms in the South that were on hard-surfaced roads had increased 70 percent.

Figure 7

Radios

Roughly 3 farm families out of every 4 have a radio in their homes. Ownership of radios practically tripled between 1930 and 1940 and increased another 21 percent between 1940 and 1945. This unparalleled spread of a new device indicates the great importance attached to radios by farm families. A radio is relatively inexpensive, and battery sets are available for homes that do not have electricity.

Possession of a radio does not give any indication of the extent of its use, of course. In the Quarterly Survey of Agriculture, April 1945, it was said that one-sixth of the farm homes reporting a radio had a set that was not in working order. Shortage of batteries, tubes, and other parts made it difficult for rural people to keep their sets in repair during the war.

Only 6 farms out of 10 in the South had a radio and more than a third of the sets were not in working order. In the West 84 percent of the farm homes had a radio and the proportion of farms in the North with a set was even higher.

Persons per Room

The proportion of farm families living under crowded conditions declined sharply between 1940 and 1945. (table 2). In 75 percent of the farm dwellings in 1945 there was at least one room for every person; in 1940 only 70 percent of the farm families were as well situated. There were two principal causes for this gain in living conditions. The departure of family members to the armed forces or to war-industry centers reduced the number of farm people living at home and there was a net reduction in the number of farm dwellings by nearly 800,000 units. Most of this reduction occurred in 1-, 2-, and 3-room houses.

The degree of crowding is related to the incomes of farm people but it is also affected by rural customs, date of settlement, and the average size of farm families.

Table 2.- Percentage distribution of rural farm occupied dwelling units by persons per room. United States 1940 and 1945.

Persons per room	Proportion of occupied dwelling units	
	1940	1945
0.50 or less	30	35
0.51 to 1.00	40	40
1.01 to 1.50	14	14
1.51 or more	16	11

Source: Bureau of the Census. Census of Housing: 1940, Vol. II, Part 1. pp. 38-39. Bureau of the Census. Characteristics of occupied Dwelling Units for the United States Housing Special Reports Series H-46, No. 1, May 16, 1946. p. 12.

Refrigerators

The proportion of farm families reporting ownership of mechanical refrigerators more than doubled between 1940 and 1945 and the proportion of families with ice boxes increased. Increases during this period may have been influenced by larger incomes, wider availability of electricity, and the wartime need for a more careful conservation of food.

Table 3.- Percentage distribution of farm dwellings with mechanical and ice refrigerators. United States 1940 and 1945

Type of Refrigeration	Proportion of farm dwellings	
	1940	1945
Mechanical	15	30
Ice	18	28

Source: Census of Housing, 1940 Vol. II, Part 1. p. 36-37, all occupied rural farm dwelling units, both operators and nonoperators, reporting refrigeration equipment. Characteristics of occupied Dwelling Units for the United States, Housing-Special Reports, Series H-45, No. 2, July 21, 1945.

In the South where refrigeration would appear to be most needed the lowest proportion of farm operators reported an ice box or a mechanical refrigerator.

NEW BENCH MARKS

Some information not currently available from Census sources was obtained through the 1945 Survey of Agriculture in April and October of that year. The data for these items are available for only one point in time, so it is not possible to present them in conventional time-series form. Later periodic enumeration of these items by the Census, Quarterly Survey of Agriculture, or some other adequate national sampling mechanism is highly desirable as it would permit a determination of current levels and trends or changes for these items. A gradual expansion of the scope of data obtained periodically will make possible an increasingly comprehensive time series on the levels and standards of living for farm families in the United States.

Figure 8

Newspapers

Either a daily or weekly newspaper goes into 7 out of every 10 farm family homes. It is significant that only 2 out of every 10 operators had weekly papers while nearly 6 out of every 10 reported taking a daily newspaper. This is an indication of the extent and frequency with which urban influences are now reaching farm homes.

There are some regional variations in the proportions of farm families who subscribe to newspapers. Slightly more than one-half of the farms in the South report a newspaper while 90 and 79 percent of the farms in the North and West receive paper.

Figure 9

Magazines

Nearly three-fourths of the farm families receive one or more magazines. A fourth regularly take four or more magazines. Information is not available concerning the various types of periodicals received by farm operators or the number of magazines actually read.

There is a wide variation between regions. A higher proportion of farmers in the North than in the South or West receive magazines. Nearly half the Southern operators reported no magazines; a fourth of the western farmers and only a tenth of the farmers in the North received no periodicals.

SOURCE: SEE TABLE 21 IN APPENDIX

U. S. DEPARTMENT OF AGRICULTURE FIGURE 10 NEG. 46473 BUREAU OF AGRICULTURAL ECONOMICS

Sewing Machines, Washing Machines, Self-Heating Irons

About 4 out of 5 farm operators' homes have sewing machines. Regional variations are small. Of the several items considered in this report the sewing machine evidently comes closest to being considered a necessity by farm families. Sewing machines are available in foot-treadle models not requiring electric power and some of these, when bought in a used condition, have ranged downward in price to very modest amounts. The necessary minimum of clothing can be most cheaply provided for the farm family by using a sewing machine to make new garments or to removate old clothing.

Approximately one-half of the farm operators in the United States reported a power-driven washing machine in 1945. In the West and the North 4 out of every 5 farm families had a washing machine while in the South less than a fourth of farm homes were so equipped. Southern farmers, at least in the past, have used domestic labor to ease the burden of family laundering.

Slightly more than half of the farm homes had self-heating irons in 1945. As in the case of washing machines, the meaningfulness of this nation-wide figure is limited by pronounced regional variations. In the West more than four-fifths of the operators reported an iron compared with more than two-thirds in the North, and less than one-third in the South. The extension of electricity to more farm homes is expected to increase the possession of self-heating irons among farm families.

Medical Care

The health of farm people is one of the most important items in their level of living. The October 1945 Quarterly Survey of Agriculture included a series of questions on the kind of medical care received by the members of farm families during the last 3 years. The information obtained was directed toward the type of health care received rather than the frequency of the occasions requiring medical attention.

In the sample one out of every 4 farm families had at least one occasion calling for health care during the 12 months immediately preceding October 1945. (Table 4.) The proportion is slightly higher in the North and

lower in the West. It must be understood that these figures represent the judgment of respondents who may have reported only those illnesses and accidents in which medical care was used. Accordingly, the figures probably are conservative statements of need. Most of the farm families who had an occasion requiring health care reported a serious illness (16 percent). Childbirths and accidents and non-accidental deaths accounted for the remainder (table 5).

Non-accidental death	38	2

1/ Only last occasion reported.
Source: Quarterly Survey of Agriculture, October 1945.

The kind of care actually received by families reporting one or more occasions demanding health care is shown in figure 13. In 9 cases out of 10 a doctor of medicine was used. There was little regional variation. In nearly half of the cases both a doctor and hospitalization were necessary. Other kinds of practitioners and home care accounted for the remainder. The occasion receiving the highest proportion of hospitalization (slightly more than 50 percent) is childbirth, which was also the occasion with the highest proportion of cases receiving care from a practitioner other than a medical doctor.

Accidents

Farm operators were asked to furnish details concerning the last serious accident or injury to himself or to a member of his family during the preceding 3 years. Nearly 5 percent of them reported an accident. More than a third of these came as the result of a fall, more than a fifth involved a vehicle, and almost an eighth occurred while handling livestock (table 6).

Fractures were the injuries most frequently reported, followed by dislocations and cuts or lacerations (table 7). A larger proportion of the injuries involved the leg, foot, or toes than any other part of the body (table 8).

When planning prevention programs it is important to know where accidents to farm people take place. According to results obtained in the Quarterly Survey of Agriculture age is closely related to the place where accidents occur. The proportion of accidents on the farm almost doubles with the increasing age of the injured person (table 9). Persons between 20 and 49 have a higher proportion of accidents occurring on roads and lower proportion of home accidents than any other age grouping. Many persons

in this middle age group were absent from the farms during the survey. It is possible that under peace time conditions, after young people have returned to the farms and some older people have retired from farming, the pattern of accidents would be quite different.

Most of the serious accidents or injuries resulted in an appreciable loss of time (table 10). Only 4 percent of the injured persons were able to return to work in less than a week after the accident.

Organization Attendance

The participation of heads of farm-operator households and housewives in organized local community activities is one phase of their level of living. Approximately a fifth of the heads of households and the housewives reported no participation in local organizations during the 12 months preceding October 1945 (fig. 14). It must be recognized that opportunities for such participation vary from region to region and community to community, but rare is the community that provides no opportunities whatever throughout an entire year. On the basis of this figure it appears that a significant number of our farm people are living a seriously restricted life so far as taking part in community organizations is concerned.

Far most frequent for both heads of households and housewives is participation in religious activities. This emphasizes the importance of the churches to farm people. The next most frequently reported type of activity participated in includes school functions such as athletic events, plays, and programs.

For the country as a whole almost a fourth of the heads of households and housewives reported attendance at some kind of organized local activity on the average of once a week or oftener (table 11). The frequency of participation was highest in the North and lowest in the West. It should be remembered that frequency of attendance is only one measure of the intensity of participation.

Most of the heads of households and housewives attended only one kind of organization and usually that was a religious group (table 12). This was particularly true in the South. However, nearly an eighth of the heads of households and a twelfth of the housewives attended four or more different kinds of organizations during the year.

THE GAPS THAT NEED TO BE FILLED

There are many things that we still need to know in order to have a total or well-rounded picture of the level and standard of living of rural families in our country. Certainly it will be necessary to include some periodic sample measures of such necessities as food and clothing. Likewise the need for more accurate data on health conditions makes it desirable to explore the current status of the farm population with regard to various physical impairments, chronic ill health, amount of need for medical care and the degree to which it is being received. Closely related to this kind of inquiry would be a periodic enumeration of farm accidents and injuries, together with data on their causes.

Certain kinds of housing information are needed to supplement what is currently available — for example, on sanitary facilities, state of house repair, storage facilities, kind and adequacy of household furnishings, heating equipment, and on fire hazards and fire-fighting equipment. In the field of education further information is needed not only on the formal schooling of all family members, but on informal educational (1) facilities, such as kinds of periodicals received, public and private library resources, and (2) opportunities, such as taking part in organized study groups, and access to informational radio programs. Measures are needed of the time family members have for recreational activities, and of the availability of recreational opportunities. Finally, it would be desirable to examine into the degree of security with which families can look forward to maintenance of their existing levels of living, together with their opportunities for advancement.

This report, which marks the beginning of a Time Series, shows how few are the level-of-living items on which continuous periodic data are now available. To be able to tell, with any degree of completeness, whether the levels and standards of living of rural families are improving or deteriorating it will be necessary to obtain continuing periodic data on the whole range of these items so that trends can be learned and charted.

U.S. DEPARTMENT OF AGRICULTURE

FIGURE 13

NEG. 45083A BUREAU OF AGRICULTURAL ECONOMICS

APPENDIX

The Sample in the Quarterly Survey 1/

The sample upon which the results in the Quarterly Survey of Agriculture, presented in this report, are based is comprised of 2,504 schedules from resident farm operators taken in 101 counties selected to represent all farms in the United States. (See fig. 1) As a detailed statement on how the counties were selected can be obtained upon request, only an outline description of the sample is given here.

One county was selected at random from each of 101 strata. These strata were set up by dividing all counties first into eight type-of-farming areas and then dividing the counties in each of these areas into strata using component indexes 2/ constructed from 12 agricultural and population characteristics.

Area sampling was used within the selected counties, the areas used being a subsample of the areas (or segments) in the Master Sample. 3/ There were almost 600 segments in the whole sample or about 6 segments per county. This means an average of nearly 5 farms per segment.

It is possible to give an approximation to the magnitude of the sampling errors. It should be recognized that there is considerable variation in the sampling error from item to item and that the estimates of error quoted below do not include contributions from sources other than random fluctuations.

At the national level, using all 2,504 farms, the odds are about 95 out of 100 that a sample percentage is within 5 percentage points on either side of what would have been obtained if interviews had been held with all farmers in the United States under the same conditions. The odds would be about 67 out of 100 of being within 2.5 percentage points. (Note that "sampling error" as used here is in terms of absolute percentage points, not coefficients of variation.) The above statements apply to percentages ranging from about 20 to 80. If the percentage is lower than 20 or higher than 80, the sampling errors are lower than the amounts given above.

There are 10 sample counties in the West, 45 in the North (including Northeast), and 46 in the South. Results given here are subject to the largest errors for the West where the odds are about 67 out of 100 of being within 8 percentage points, whereas for the South and North the odds are roughly 67 out of 100 of being within 4 percentage points. Or, putting the odds at about 95 out of 100, we have for the West 16 percentage points and for the South and North 8 percentage points.

Rural Housing Activities of Farmers Home Administration in 13 Southern States

1. Families assisted, and average amount spent, during environmental sanitation program from grant funds through June 30, 1944:

   a. For installation of sanitary privies
      51,486 families; $1,067,415 spent. Average $20.73

   b. For installation of sanitary water supply
      25,681 families; $1,022,834 spent. Average $39.83

   c. For installation of screens
      33,789 families; $ 596,917 spent. Average $17.67

   No accurate number of families helped under this part of program can be given because one family may have had one, two, or three of these installations on their farm. A cumulative record shows that 84,414 families had received sanitation grants up through 6/30/43; but no cumulative records were kept after that date.

   Since 1944, through March 31, 1948, records show 3,108 families installed or improved sanitary privies; 3,934 families screened houses; and 4,436 provided or improved water supply.

2. Farm ownership type loans made
   through March 31, 1948.....38,312

3. New dwellings provided through
   farm ownership loans made from inception of program thru December 31, 1947.....18,000

4. Number of projects and housing units constructed thereon:
   102 projects, all types
   5,835 economic units

   In addition there were many units of a non-economic nature which included construction. The 102 projects includes the labor camps, for example where much construction was done but no economic units were included in the project.

Information on all four points, above, are totals from the 13 states of Kentucky, North Carolina, Tennessee, Virginia, Alabama, Florida, Georgia, South Carolina, Arkansas, Louisiana, Mississippi, Oklahoma, and Texas.

December 1947

Rural Housing Is Business of Farmers Home Administration

Dillard B. Lasseter
Administrator, Farmers Home Administration

The Farmers Home Administration Act of 1946 made possible at least a limited solution to the important problem of rural housing. The Act includes authorization to make and insure loans to tenant farmers, sharecroppers, farm laborers, and owners of inadequate or under-improved acreages for the purpose of purchasing, improving, or enlarging such farms.

During the 1947 fiscal year, the Farmers Home Administration loaned a total of $43,420,698 for such real estate purchase or improvement purposes to 5807 families. Of these loans, $5,071,712—11.6 per cent—was used to construct new dwellings, or to repair or modernize existing dwellings. Most of it—$2,931,888—was used to construct new dwellings.

An additional 8.9 per cent of the total loaned, roughly $3.8 million, was used to construct or repair other farm buildings.

Most of his housing activity was in the southern states, where the need was most acute. In the reclamation areas of the west, too, considerable work is now in progress with agency credit. Families who settled on these reclamation projects own their land but many of them are living in temporary shacks of one or two rooms. Agency credit is making permanent housing possible for many of these families.

Rural Housing Need

For decades there has been a growing realization of the importance of such construction to the health and to the social and material well-being of farm families but for the most part inadequate housing has always been associated in the public mind with city dwellings.

Yet rural farm dwellings in general are inferior to those of urban families.

This fact was rather plainly revealed by a depression-years tenancy survey, out of which grew the Bankhead-Jones Farm Tenant Act of 1937. This Act established a system whereby tenants unable to obtain credit from private sources could turn to the government for funds needed to buy family-type farms of their own. During the ten years this law has been in effect, approximately 48,000 farm families have found a ladder up which they could climb from tenancy to the ownership of their own adequately improved farms.

The Farmers Home Administration Act of 1946 amends and broadens the scope of this earlier Bankhead-Jones Farm Tenant Act. It provides a means—through the insured mortgage features of the Act—for private credit sources to participate in this program with the safety of a government guarantee for their loan. It makes it possible for disabled veterans to purchase farms, previously impossible in the existing legislation. It includes provisions for the development of unimproved or under-improved units that are much broader than previous legislation.

In-the-Home Training

In addition to these credit services to farm families, the Farmers Home Administration and its predecessor agencies have been able to offer many additional services that have proved valuable to the recipients. It has helped the farmer--and especially the farm wife--solve home management problems by in-the-home instruction by qualified home management specialists. These women showed the farm wife how to "make over" or "make do" so that their homes could be adequately, cleanly, and becomingly furnished. They taught borrower-families ways to preserve or lengthen the life of existing improvements and how to pay for needed improvements from increased farm income. They taught the families simple farm record keeping, so that it became possible to budget necessary expenses for home repair or improvement.

In its earlier years of operations, much experimentation was done in the field of low-cost housing, so that borrowers could be helpfully advised on the best and most-easily-budgeted methods of repairing their farm improvements or of replacing them. This work included experimentation with rammed earth, adobe, cotton, steel, and masonry houses and with precutting and prefabricating methods of construction.

To understand the work that the Farmers Home Administration is now doing in the housing field, and the work of its predecessor agencies, it is important, first, to see the problem of rural pvoerty and the need for elimination of rural slum areas.

Rural Poverty

A recent report prepared by the Interbureau Committee on Post-War Programs states: "An important reason for inadequate farm housing has been the lack of sufficient remunerative employment to pay for better structures." The 1945 census of agriculture shows that half the farmers of the nation earned gross incomes of less than $1500 per year during 1944--a war year of high prices for farm products. Their net income, after paying operating expenses, was obviously much lower and left very limited funds for family living expenses and for making capital improvements on their land.

The previously cited Interbureau report further states: "In general the quality of farm housing corresponds with the capacity of the farm or combination of farm and off-farm employment to support the dwelling. Of 5,760,000 farm operator dwellings on farms in 1940, approximately one-third could be classified as 'Acceptable', another third as 'Repairable', and the final third as 'Non-Repairable'. . . .In the case of 3,200,000 farms where income would not finance acceptable housing, more than a million and a half of the farm homes in the group were reported as non-repairable."

These figures were based on material from the 1940 census and indicate problems present at that time. They are probably even more significant today. There was little or no new construction or major repairs during the war years. Since that time, materials have continued to be expensive, difficult to obtain, or of poor quality. Labor to make necessary repairs or to do construction work has been almost nonexistent, or too expensive for the farm families who need it most. In the seven years 1940-1946,

existing housing continued to deteriorate without replacement or repair in proportion to the deterioration. There was, however, a compensating reduction in farm population as farm youth entered the armed forces and their families moved to the cities for war jobs. In the postwar period, however, many of these families returned to the farm, only to find rural housing the big problem it was at the time of their leaving.

Type of Help Available

What tools are available to solve this problem of rural housing? For the city dweller, the Federal Housing Administration is doing an excellent job but it is unable to operate in most rural areas. While private credit was available to the well-to-do farmer, up to 1937 there was very little legislation that would help the low-income farm family--the group that needed assistance most. The Public Housing Administration has been authorized under various legislation to do some rural housing construction but it has operated only a limited program in this field. Only an estimated 5000 farm homes have been either built or repaired by this agency.

The Extension Service of the Department of Agriculture developed many plans that a farmer could use in building satisfactory dwellings, if he could find the necessary credit. The Farm Credit Administration, through its Federal Land Banks and Land Bank Commissioner Loans, offered credit to those farmers who had sufficient equity in the land or security of other kinds so that they did not need to finance more than 65 per cent--in the case of Land Bank Commissioner Loans 75 per cent--of the indebtedness.

But in 1937 there was no agency of government that had legislative authority to make the 100 per cent loans needed by families whose housing problems demanded the most prompt attention.

The Bankhead-Jones Act, passed that year, made a step in the right direction when it offered tenant farmers, sharecroppers, and farm laborers an opportunity to get 100 per cent loans to buy family-type farms. Funds could be included in such loans to make necessary improvements to either the land or the structures on it, so that the dwellings met certain minimum standards. These standards included:

Minimum Standards

1--The house should be located on a farm providing an effective employment opportunity that is capable of supporting, in terms of normal wages and prices, at least a satisfactory standard of living while the loan is being repaid.

2--The site should be well drained and suitably located in relation to the farm buildings. Where roads are not surfaced, the site should be beyond the dustline.

3--There should be available a supply of good water at all times. Wells, springs, cisterns, plumbing, septic tanks, chimneys, heating installations, and construction in general should comply with sanitary and safety standards.

4--The roof should be tight to water at all seasons; floors tight and so finished as to permit easy cleaning; walls tight and constructed for comfortable year-round temperature. Inner walls and ceilings should be made of materials that will reflect a reasonable amount of light, deaden some noise to insure privacy, and be capable of cleaning. Ceiling height should be not less than 7 feet, 4 inches.

5--Windows should be screened.

6--Sufficient storage space should be provided for family needs.

Using these minimum standards, farms purchased under the tenant-purchase program frequently required major renovation or complete rebuilding and, until materials became too scarce in the war years, funds were included in the loan to permit such needed construction.

Agency procedure determined that funds should not be included in farm ownership loans to repair old dilapidated structures that would be short-lived and unsatisfactory if they were repaired. The rule is that such structures should be demolished. Suitable new structures should be built if they are needed and essential to the successful operation of the farm. On the other hand, structures of value and potential usefulness should not be destroyed but should be repaired.

A Problem

This policy frequently posed a new question, however, since the legislation in existence at that time made it impossible to loan a borrower, for the combined purchase of a farm and necessary repairs to buildings and land, a sum totaling more than the average value of all farms covering 30 acres or more in the county. In many counties this loan limitation meant that a family could borrow only a few thousand dollars--it was actually as low as $1000 in some southern counties--for farm purchase, plus improvements. In many counties the program was entirely inoperative because of this loan limitation figure.

Despite these limitations, the agency loaned, prior to the passage in 1946 of the Farmers Home Administration Act, almost $260 million dollars, to approximately 41,000 families. While a major portion of this lending was for the purchase of farms, it included a sizable amount for actual construction or repair of dwellings.

The actual amount spent on such improvements might have been much higher except for the war. During 1940-46, the agency earmarked funds for necessary improvements but this money was not spent while materials were scarce or were needed for vital war purposes. Today the agency is recommending to all borrowers that funds for construction be used within 15 months after closing the loan.

With the passage of the Farmers Home Administration Act in 1946, the war-decimated housing activity of the agency was given a transfusion that has resulted in the previously mentioned $5 million dwelling construction.

FHA Powers

Specifically, under the Act as now written, the Farmers Home Administration may undertake the following services:

1--Make loans for the purchase and improvement of farms. Under this provision, persons who do not own their own farms and do not have credit available to finance such purchases or improvements, may borrow up to 100 per cent of the amount needed for such purchases or improvements. These are direct government loans, repayable at 3½ interest, on a variable payment plan, geared to farm income, and allowing a maximum of 40 years for complete amortization. All such loans must be made for either the purchase or improvement of farms which, as purchased or improved, constitute an efficient family-type unit capable of supplying full employment for the operator and of producing sufficient income to repay the loan, while at the same time providing an adequate level of family living.

2--Make loans for the purchase of additional land needed to enlarge an uneconomic unit into a family-type farm. Owners whose farms are too small to qualify as a family-type unit may obtain funds to permit them to purchase additional acreage that will bring their holdings up to an efficient level.

3--Make loans to develop under-improved farms. An owner whose farm is inefficient because it lacks needed improvements may obtain loans for the construction, repair, or replacement of such improvements. Similar loans may also be made for soil improvements, fencing, and terracing.

In all three types of loans, both the applicant and the farm he desires to either purchase, improve, or develop must be approved by a committee of three local persons, at least two of them farmers. All loans must be at or lower than the average value of all efficient family-type farm units in the county. This change from all units 30 acres or more to all efficient units has now made it possible to make loans in most counties and the minimum price limitation in effect anywhere in the country is now $4500.

In all three types of loans, funds may be included for either construction or repair of the family dwelling to meet satisfactory requirements of health, safety, and convenience. All farms must be ones that, when purchased, improved, or developed, will "appraise out" on the basis of long-time prices and normal earning capacities. Veterans have preference for all loans.

Insured Loans

The Act also added one further feature not previously included in rural credit legislation. For the first time, a place for private credit has been found in the government's agricultural credit set-up. Loans made by private lenders that do not exceed 90 per cent of the investment in the farm will be insured by the Farmers Home Administration. Because of this safety factor, and because the Farmers Home Administration does all the servicing on such loans, private lenders may reasonably be expected to

accept this type of credit as readily as they do the Federal Housing Administration credit available to city dwellers. Lenders receive 2½ per cent interest on their investment but the borrower pays 3½ per cent. The difference goes to the agency for payment of insurance costs and servicing fees.

Despite the authorization carried in the Farmers Home Administration Act, applicants should not expect a major housing program by the Farmers Home Administration in our rural areas during the fiscal year 1948. While the authorization for direct loans is $50 million, appropriations for the coming year are less than one-third that amount. It is estimated that the actual appropriation of $15 million will permit the Farmers Home Administration to make approximately 3500 loans--but there were 55,000 applications for such services on hand at the end of the 1947 fiscal year.

Authorization for the insuring of privately made loans was set in the Act as $100 million in any one year but the actual number made will depend entirely upon the degree to which private credit circles accept this new farm financing scheme and it is expected that during the first year or so, only a pilot program will be carried on. (The first loan under the insured mortgage feature of the FHA Act was made in Americus, Georgia, on October 3, 1947.)

Guidance Available

To help borrowers repay Farmers Home loans, no matter whether they represent direct government credit or insured mortgages on loans made by private lenders, the agency supplies on-the-farm guidance in farm and home management where needed. It has skilled farm and home management field staffs who visit families periodically, help them plan their operations, and provide any technical assistance needed.

At least partially because of this on-the-farm assistance, borrowers are repaying their loans far ahead of schedule. Of the 47,000 families who have borrowed to date, 16 per cent have already repaid in full loans that had 30 or more years yet to mature. All borrowers still on the program have paid 156 per cent of the scheduled repayment, based on 40-year amortization.

FARM HOUSING IN THE BLACKLAND PRAIRIE AREA OF BELL COUNTY, TEXAS

Wayne C. Rohrer, Assistant Professor
Department of Agricultural Economics and Sociology

Housing of farm people has become a national problem through an intermingling of cause and effect. Because many farm tenants move frequently--often annually--they do not acquire the attachment for a house which is necessary to insure that the house is maintained in a sound condition. On the other hand, many landlords, who have had a succession of tenants who failed to care for their property, will not spend money on repairs or improvements. Because farmsteads are comparatively isolated, it has been considered too costly to provide most community public services for rural areas. Thus, the deficiency of gas, electric, water and disposal services has contributed greatly to the low level of rural housing. The irregularity of farm income is another characteristic of rural life which has prohibited routine maintenance and improvement of the farm house. Years of low income have failed to provide the necessary cash, and the money received in years of high income has gone to clear debts incurred in previous years or for additional land, livestock or farm machinery.

This report is concerned with the housing of 294 white farm operators, 162 tenants, 53 part owners, 79 full owners, living in eastern Bell county, Texas in 1942. (A full owner owns all the land he operates. A part owner owns part and rents the remainder of the land he operates. A tenant operates only rented land. Rent is paid in the form of cash, a share of the crop plus cash, or by crop share, usually one-third of the grain and one-fourth of the cotton.) This portion of Bell county was selected as representative of rural conditions in the Blackland Prairie type-of-farming area.

Despite the age of these data, they are representative of the relative levels of tenant and owner housing as found in the Blackland Prairie in 1949. Tenant housing in 1949 is more adequate than it was in 1942, but it still lacks many facilities and conveniences found in the house of an owner. Since the end of World War II, landlords have improved tenant housing by re-roofing, screening porches and re-painting. Owner housing has been improved by building new houses or re-modeling old houses. Re-modeling has included the addition of sanitary facilities, re-roofing, re-painting and additional rooms. Farm housing will be improved so long as farm income remains at a high level.

The data indicate that tenure and size of farm unit influence the level of housing attained by the farm family. As tenure is the more important of the two, the level of housing is given for each type of operator without regard to size of farm. Full owners live in the best houses; the part owner's house is nearly as adequate; and the tenant's house is the least adequate. Because tenure is so influencial in determining level of housing, strengthening the landlord-tenant relationship should benefit housing of tenant-operators. Improvement of the farm leasing system by introduction of written farm leases that include provision for improving farm housing would do much to make stable and secure the landlord-tenant relationship. Then it would be likely that the landlord would improve tenant housing, and the tenant would take care of the landlord's property.

Within each type of operator group, those who farmed the large units (120 acres or over) have better houses than do the operators of small units (0-119 acres).

Some Characteristics of Farm Housing

A well cared for farm house will be a well painted one. Paint has high economic value in that it is a preservative and thus extends the life of a house. At the time of the survey over half of the tenants lived in unpainted houses, or houses whose exterior paint was in poor condition (Table 1). On the other hand, 58 percent of the part owners and 61 percent of the full owners had houses whose exterior paint was in good condition.

Table 1. Condition of exterior paint

Type of operator	Unpainted	Painted	
		Poor condition	Good condition
	%	%	%
Tenants (162 cases)	32	20	48
Part owners (53 cases)	25	17	58
Full owners (79 cases)	11	28	61

Fifty-six percent of the full owners lived in a house which was less than 25 years old (Table 2). Over half of the tenant and part owner houses were more than 25 years old.

Table 2. Age of house

Type of operator	0-9 years	10-24 years	25-49 years	50 years and over
	%	%	%	%
Tenants (162 cases)	6	35	43	16
Part owners (53 cases)	23	23	47	7
Full owners (79 cases)	27	29	38	6

Seventy-six percent of the tenants and 58 percent of the part owners lived in houses which provided less than two rooms per person (Table 3). On the other hand, 63 percent of the full owners lived in houses which provided two or more rooms per person. This difference is at least partially attributable to the variance in number of persons in a family. Tenant and part owner families included more than three persons living at home; full owner families included less than three persons. (The stage in the family cycle is emphasized by the difference in the age of the family heads. The average age of the tenant-operator was 42 years, the part owner was 49 years, and the full owner was 55 years.) Another significant factor was the difference in the average number of rooms in the house. Tenant houses averaged four rooms, part owner houses five rooms, and full owner houses nearly six rooms.

Table 3. Rooms per person

Type of operator	Less than one room	One room, less than two	Two rooms or more
	%	%	%
Tenants (162 cases)	29	47	24
Part owners (53 cases)	13	45	42
Full owners (79 cases)	5	32	63

A majority of the farm operators had a house which included at least two bedrooms, a separate living room and a separate kitchen (Table 4). Seven out of 10 of all owners had a house which included a separate dining room.

Table 4. Room type

Type of operator	One bedroom	Two bedrooms	Three or more bedrooms	Living room 1/	Dining room	Other 2/
	%	%	%	%	%	%
Tenants (162 cases)	24	46	30	77	45	9
Part owners (53 cases)	11	59	30	91	68	2
Full owners (79 cases)	6	47	47	81	72	9

1/ Only rooms used solely as living rooms were counted. If a room served as a living room and also as a bedroom, it was counted as a bedroom.
2/ Includes dens, parlors and sun porches.

Fewer tenant's houses than owner's houses had sanitary facilities such as a drained kitchen sink, running water and a bathroom (Table 5). More operators had drained kitchen sinks than had either of the other two facilities. It might be interesting to note here that the Czech operators fell behind other farm operators in providing sanitary facilities for the house. (The sample included 88 Czech farm operators. An operator was considered to be of the Czech ethnic group if the Czech language was the primary tongue used by his family.) This was true when size of holding and tenure status were held constant.

Table 5. Sanitary facilities

Type of operator	Kitchen sink	Water piped into house	Bathroom
	%	%	%
Tenants (162 cases)	17	14	9
Part owners (53 cases)	56	56	43
Full owners (79 cases)	65	55	48

Thirty-nine percent of the tenants, 82 percent of the part owners and 74 percent of the full owners lived in a house which was lighted by electricity. It is evident that tenure is influential in this aspect of farm housing. The farm home and business are made more convenient and efficient through the addition of electricity. Also, electricity usually

stimulates the farm family to install other housing improvements. Thus, the addition of an electrically powered water pump will likely be followed by the installation of sanitary facilities.

The effect of tenure was apparent when comparing the value of the house which was occupied by each type of operator. The average value of a tenant house was $698; part owner's, $1,043, and full owner's was $1,512. Low as the average values are, the eastern Bell county farm house compared favorably with farm houses in the rest of the country. The median value of farm houses in the 13 Southern States in 1940 was $443, and for the other states it was $1,048, according to "Housing in the South," published by the Southern Regional Council, Atlanta, Georgia, April 1948. (These regional averages are based on housing of all farm people. This report does not include housing of share croppers and farm laborers.)

The eastern Bell county farm operator's house had a floor of planed softwood. The few hardwood floors found by the survey were in owners' houses. The house had a wooden shingle roof which did not leak. Three doors and between two and three windows per house was the general rule. Generally, windows and doors were well screened.

Summary

The ownership of the farm unit is a strong influence in determining level of housing. It was found in this survey that a farm owner-operator's house as compared with a farm tenant-operator's house was larger, newer, better painted, and had a higher value. Also, it was more likely that the owner's house had sanitary facilities and electric lights. Housing of both owners and tenants was improved during the war and postwar periods. However, the relative differences in the housing of owner-operators and tenant-operators are still in existence.

The size of the farm unit is also an influence in determining level of housing. It was found in this survey that operators of large units (120 acres or over) had better houses than did the operators of small units (0-119).

Most farm operators in eastern Bell county lived in a one-story house which provided one-to-two rooms per person, well-screened windows and doors, a finished floor of softwood and a sound roof of wooden shingles.

Acknowledgment

This report is based on data collected for the Regional Land Tenure Research Project under the sponsorship of the Southwestern Land Tenure Research Committee, composed of representatives of agricultural economics and rural sociology departments in the land-grant colleges of Arkansas, Louisiana, Mississippi, Oklahoma and Texas, and one representative each from the USDA Bureau of Agricultural Economics, and the Farm Foundation. The project was financed by the institutions represented and the General Education Board. The data were collected in late 1942 and early 1943.

The purpose of the survey was to study land tenure and the effect it may have on the economic and social life of the farm family and the rural community.

- 0 -

16 - Housing

Public Law 171 (81st Congress) signed by the President on July 15, 1949, authorizes, during a four year period, government loans to help farmers construct or repair existing houses or other farm buildings. Actual loan making, however, will await Congressional action on appropriations to implement the new Act.

Also authorized are a limited number of grants to correct housing defects which menace health or safety of the occupant or the community.

If appropriations match authorizations in the Act, approximately 13,000 farmers can be aided by loans or grants the first year, while a total of 135,000 will be assisted during the four year period. Authorization in the Act provides a total of $275,000,000 loans and grants over the four year period, with $25,000,000 for construction or repair loans during the first year and $2,000,000 for grants or combined grants and enlargement or development loans during the same period.

To be eligible for loans, a farmer must be unable to get needed credit for housing improvements from other sources. Loans can be made only to farm owners, but owners may avail themselves of the benefits of the Act to provide better housing for tenants, sharecroppers and farm laborers.

Most loans will be made to farmers whose income from farm and other sources is considered sufficient to repay the loan plus interest without further assistance from the government. The legislation does not set a limit on the amount a farmer may borrow for housing or other farm buildings; but it is estimated that such loans—expected to be primarily for remodeling rather than new construction—will average about $2,200.

A loan may also be made where the farmer's income is considered inadequate to make repayments as scheduled during the first few years of the loan. On such loans, the borrower agrees to revise his farming operations or make other improvements needed to protect the government's investment and earn enough income to meet his scheduled payments. During the first five years of the repayment period the

borrower may, if he has lived up to the terms of his agreement, and his income is insufficient to make scheduled payments have up to half the principal payment and all the interest due in an installment year written off by a contribution made by the Government.

Where necessary loans may also be make to enlarge or develop inadequate farms to provide sufficient income to support decent housing.

Loans are repayable in a maximum of 33 years, and carry 4 percent interest. A moratorium on payment of principal and interest may be granted when, because of circumstances beyond his control, the farmer is unable to make scheduled payments. In extreme hardship cases, interest may be cancelled during the moratorium.

Grants for minor improvements may be made to farmers who are unable to qualify for farm construction and repair loans. A grant may be used only to make dwellings or other buildings safe and sanitary or to remove hazards to the health of the occupant or community.

Grants to any individual may not exceed $500, and the total of grants and special loans for minor improvements may not exceed $1,000.

All phases of the farm program set up by the Act will be handled by existing agencies. Financial assistance will be administered by the Farmers Home Administration. All applications for such services will be filed at county offices of this agency. Preference will be given to veterans and to families of deceased servicemen.

Supplemental services such as research on new materials and construction methods will be carried on by the Agricultural Research Administration. The Bureau of Agricultural Economics will conduct surveys of housing needs in rural areas. The results of such research and surveys, including plans and specifications for construction, will be made available to all farmers through the Agricultural Extension Service.

The existing Farmers Home Administration county committees composed of local farmers will assist in administering the program. They will certify as to the eligibility of the applicant and the reasonable value of the farm.

16 - Housing

FACT SHEET ON FARM HOUSING LOANS

The Housing Act of 1949 authorizes government loans to help farmers construct or repair houses and other farm buildings. It also authorizes a limited number of grants to correct housing defects which are dangerous to the health or safety of the farm family or the community.

The program will not be placed in operation until funds are made available by action of Congress.

ELIGIBILITY

To be eligible for a loan, a farmer must be unable to get needed credit for housing improvements from other sources. Loans can be made only to farm owners, but landlords may use the loans to provide better housing for tenants, sharecroppers or farm laborers. Veterans have preference.

TYPES OF LOAN ASSISTANCE

A loan may be made to a farmer whose income from farm or other sources is considered sufficient to repay the loan plus interest without further assistance from government. A loan may also be made where the farmer's income is considered inadequate if the borrower agrees to revise his farming operations or make other improvements to protect the government's interest, and if such changes will make his income adequate to repay the debt on schedule. In this case, the government may forgive the interest and up to half the principal due during the first five years if the borrower is unable to make full payments and if he is following the improvement program outlined at the time of making the loan. A loan may also be made to enlarge or improve farm land to make the unit capable of producing income that, combined with income from other sources, will repay a housing loan and sustain the family.

TERMS OF LOANS

Loans are repayable in a maximum of 33 years at 4 percent interest. A moratorium on principal and interest payments may be granted when, because of circumstances beyond his control, the farmer is unable to make scheduled payments. In extreme hardship cases, interest may be cancelled during the moratorium.

HOW TO APPLY

When the program is placed in operation applications will be filed at local offices of the Farmers Home Administration, usually located in the county seat. The eligibility of all applicants must be certified by the local county committee of three farmers before loans may be made.

INFORMATION KIT

FOR ADMINISTRATIVE USE ONLY

August, 1949

SUBJECT: "FHA and Rural Housing"

CONTENTS: 1 Radio Broadcast, 1 Talk, 1 Press Release

This Information Kit on farm housing is intended for state and county office use in helping to correct any misunderstanding on the part of the public, and to present more complete information where the coverage has neglected the farm programs.

With the passage of Public Law 171 (81st Congress)--the Housing Act of 1949--considerable information has been carried in the press and on radio stations attempting to explain the provisions of the Act. While this information has been essentially factual, it is frequently misunderstood and the general public may be confused as to just what to expect, when funds will be available, and how to apply for assistance. This is particularly true of the farm sections of the Act, which have received less coverage since most newspapers and radio stations address their major coverage to urban families.

The kit includes a radio broadcast in question and answer form which can be given by the station announcer and any FHA supervisor, state director or committeeman with minor revisions. It also includes a news release which provides the essential information needed for press coverage; and a talk which could be used in addressing civic, service, farm or veteran groups.

Any of the pieces attached could be adapted for other use. The news-release, for example, could be given to radio stations for the farm news programs; the talk used as a straight-talk over radio; the radio program or talk given to newspaper correspondents as background information for any article they might write. Any of the material could be given to interested persons who want information on what we will do under the terms of the Act. Information in kit should not be destroyed after use, since it will be suitable for re-use later. With minor adaptation it can be used to announce what will be done after appropriations are made, as background information when telling about the first farm housing loan made in a state or county, or in summarizing results of the program once it is well under way in a state or county.

RADIO SCRIPT

ANNOUNCER: I see by the papers Congress has now passed a national housing program, and included in it loans to help farmers improve their homes and farm buildings. . . .Mr. _____, supervisor of the Farmers Home Administration for _____ County (or counties) tells me that his agency has been selected to make these loans, so station _____ has asked him to come in and tell us about it. . . .Mr. (SUP.), where shall we start?

SUPERVISOR: Thanks (ANN.), for giving me this chance to tell your listeners about farm housing loans. I've already had a number of inquiries since the newspaper and radio said such loans were authorized, and so I know a lot of _____ County farmers are interested. Maybe if we just answered for your listeners the same questions farmers are now asking me, it will help.

ANN: That sounds like a good idea. What is the question they ask first?

SUP: I guess most of them want to know WHEN they can get the money.

ANN: That sounds like a good start, anyway. Just when will they be able to borrow money for farm housing?

SUP: (GIVE LATEST AVAILABLE INFORMATION, WHICH WILL DEPEND ON STATUS OF APPROPRIATION BILL. AT PRESENT ANSWER WOULD BE:)

I wish I could give a definite answer to that one, but I can't. . . . You see, the new Housing Act authorizes farm housing loans, but it didn't make any money available for that purpose. And we can't loan money we don't have. . . . The President has submitted a budget for the consideration of Congress. The radio newscasts and the newspapers will tell your listeners what the decision of Congress is. We will be able to accept application soon after funds are appropriated.

ANN: Well, with all the talk about Congress expected to recess soon, any action they take should come in the next few weeks. Is that right?

SUP: Yes. . .and I promise to send you word just as soon as we know.

ANN: In the meantime, it seems that the important answer to the WHEN question is a matter of understanding words. So far all we have is an "Authorized". That simply means your agency has a go-ahead sign, as soon as you get money to do it. Now you're waiting for another word--"Appropriated". When we hear that one, we know it's time to apply for loans.

SUP: Right. . .Of course if folks who need a farm housing loan want to drop into our office or mail me a card, I'll see that they receive word, too, just as soon as funds are appropriated and they can make formal application. But really, we can't do any more, at present, than just explain what the program WILL be, and take names for future action.

ANN: At least that's something. . .but go ahead with the questions your office-visitors ask. What is their next question?

SUP: I guess they want to know WHAT. What they can get loans for, mostly.

ANN: And what do you tell them when they ask you that?

SUP: Well, the law is specific. . .Loans can be made to provide decent farm dwellings and other farm buildings. In a few cases funds will even be used to make farm enlargement and development loans. . .if the applicant's present income isn't enough to repay the loan and if buying additional land or improving the land he owns can boost his income high enough to pay the loan and support his family.

ANN: Just WHO can obtain these loans?

SUP: That's usually one of the questions I'm asked, so I have the answer to that one. . .Only farm owners may borrow under this Act.

ANN: Than what about the tenant, the sharecropper, or the farm laborer? Usually their housing is worse than the owner's.

SUP: That's right, and the owner of a tenant house can borrow to rebuild or repair that tenant housing. But the loan must originate with the owner. That's at least partially to provide added security to the government's investment. We take a mortgage on the property where the construction is done, and we couldn't do that if we made a loan to a tenant.

ANN: I was going to ask what security the government required for the loans. The answer is a mortgage on the farm, right?

SUP: Yes. . .and if necessary to protect the government's interest, other security might also be asked. But we haven't worked out all the details on that score--yet.

ANN: Then let's discuss some where you do already have the answers. Can ANY owner of a rural dwelling obtain a loan to rebuild or repair?

SUP: No. . .The law says only owners of FARMS. . .and it defines a farm as any parcel or parcels of land operated as a single unit for the production of one or more agricultural commodities for sale or home use which have an annual gross value of $400 based on 1944 commodity prices.

ANN: Whee! Let's go back and see if we can say that in words the listeners will remember.

SUP: How's this? We can make a loan to an owner of land which annually produces at least $400 worth of usable foods or fibres based on 1944 prices.

ANN: That's better. . .but my arithmetic isn't very good today. How much would the borrower have had to grow in 1949 to qualify on "$400 based on 1944 prices" part.

SUP: About $550, roughly.

ANN: Now we're getting somewhere. If my farm produces at least $550 this year, and I'm an owner, than I could qualify.

SUP: Maybe. . .there's another qualification we think is important. Government, you know, isn't trying to compete with private business, so if the owner can obtain credit elsewhere, he still isn't eligible. We will make loans to farmers whose farm produced enough to qualify, and who can't get needed credit elsewhere on reasonable terms.

ANN: I'll accept your qualifications. Now WHAT kind of a loan can I get, supposing I can qualify otherwise?

SUP: Actually there are three different ways we might help you. . .

ANN: Then let's take them one by one.

SUP: We think most of the loans will be to what are called adequate-income farmers. That means that the borrower will be able to repay on schedule from his farm and other income, any loan made to repair or construct buildings on his farm. For such an applicant, loans are repayable in a maximum of 33 years, at 4 percent interest. In the event of bad years, a moratorium on principal and interest may be granted him, and in extreme emergencies, the interest during moratorium periods may be entirely forgiven.

ANN: How big a loan would be available under this plan?

SUP: The law doesn't set any top limit, but because we believe most loans in this class will be for remodeling rather than new construction, we've estimated that they will average about $2,200 apiece. That's just a guess, of course.

ANN: You said three ways you can help. What are the others?

SUP: Well, next we might mention what--for lack of a better name--we are calling loans to farmers with potentially adequate income.

ANN: That doesn't sound like a very safe sort of loan.

SUP: That's why I hesitated to call it by that name. Actually we believe they will be very safe loans, because safeguards are written into the loan itself to give added protection to the government.

ANN: What do you mean by that?

SUP: Well, the loan is made only if an appraisal shows that potentially the income is adequate, even if it isn't actually there at the moment. Then, to make sure this potential income actually comes in, the applicant works out a farm and home plan which will bring the desired income. For example, maybe he would have enough income if he added two or three dairy cows to his farming enterprise so there would be some milk checks to help pay the loan. Or maybe he is now selling only cream but would have enough income if he made over his dairy barn so he could sell Grade-A milk.

ANN: So what you are actually doing is helping the borrower plan how to make his farming operations pay enough to repay the housing loan.

SUP: That's about it. . .and we know that in the first few years of making such farming adjustments, many farmers can't do the necessary rebuilding and also pay as they plan on their housing loans. So the government is authorized, in the act, to give a helping hand where necessary.

ANN: And how is that done?

SUP: Each year of the first five years, IF the borrower is doing the farm development work he agreed to do, and if his income proves too small to make full payments the government may forgive the interest payments, and up to half the principal for that year.

ANN: Supposing that a farmer in order to increase his income and pay off his housing loan needs to buy additional land or develop the land he already owns. Can he get a loan for these purposes?

SUP: He can. A limited amount of money is authorized for land enlargement or development when this would help a farmer get the income he needs to pay off his housing loan.

ANN: That sounds as if it would really be helpful. But our time is running short. What about the third type of service?

SUP: Special loans and grants for minor repairs can be made in order to make a dwelling safe and sanitary, or to remove hazards to the health of the occupant or the community even if the borrower's actual or potential income is not large enough to support minimum housing standards. He will receive a loan for that part he can reasonably be expected to repay, and a grant for the balance. Grants may not exceed $500, nor can the combination of special loans and grants exceed $1,000.

ANN: Well, while I realize there are a lot of questions left unanswered, we'll have to defer them until some later broadcast. Let's see if I can summarize what we've said today. . .First, the present Act only authorizes loans, and the actual loaning must wait until money is appropriated. . .

SUP: But someone needing farm housing can get further information, now, or leave his name and address with us so he can be notified when funds are available.

ANN: RIGHT. . .Next, loans may be made to construct new dwellings, or other farm buildings, or to rebuild existing farm structures, but can be made only to owners.

SUP: Check. . .And the loans are for a maximum of 33 years, at 4 percent interest.

ANN: The loan can be made to a farmer whose present income would repay the loan on schedule, or to a farmer who can work out a sound plan for rebuilding his farm to produce the necessary income.

SUP: And if he does a good job of improving the farm so it will produce added income, the government may help him over the first few hardest years by forgiving the interest and up to half the principal payment due during the first five years.

ANN: And finally, the applicant might be able to get a loan to buy additional land or develop the land he owns if that will make his income support a housing loan. . .or he might get a grant to make minor improvements which will protect the health and safety of the occupant or the community.

SUP: Sounds like that's the program in a nutshell. . .and I'll let you and our listeners know just as soon as we can start taking actual applications. At that time I'll also tell them about committee approval, appraisals, and other technicalities connected with the actual making of a loan.

ANN: That's a promise. . .Folks, you've been listening to Mr. _____, supervisor of the Farmers Home Administration for _____ County, tell about the new housing authorization as it applies to rural families. (USUAL END)

NEWS RELEASE - Housing Kit

Farmers in _____ County are showing considerable interest in the new Housing Act recently passed by Congress and signed by the President on July 15, according to _____, Farmers Home Administration supervisor. He said that his office had received a number of calls or visits from farmers anxious to construct or repair farm buildings.

(Supervisor), said, however, that his office was not as yet accepting applications for farm housing loans. The actual loaning program will not be placed in operation until funds are made available by action of Congress. At present he is keeping names and addresses of persons desiring loans; and will notify them as soon as funds are availalble.

To be eligible for loans once funds are available, an applicant must be a farm owner, and be unable to obtain credit for his construction or repair work from local sources at reasonable terms. A farm tenant may not obtain a loan under the Housing Act; but a farm owner may borrow to repair or construct farm buildings for his tenants.

In a brief description of the farm housing program as authorized, Mr. _____ said that most loans would be made for construction or repair of homes and other farm buildings to farmers whose income from farm or other resources is sufficient to repay the loan plus interest without further assistance from government. On this type of loan the Act does not set a limit on the amount a farmer may borrow, but _____ estimated that--since most of the loans are expected to be for remodeling rather than new construction--nationally they would average about $2,200. Loans will be repayable in a maximum of 33 years, at 4 percent interest. When a farmer, because of circumstances beyond his control, is unable to make his payments, a moratorium on interest and principal may be granted, and in extreme cases the interest for that year may be forgiven.

A farmer whose income is considered inadequate to repay a loan on schedule may borrow money if a change in farming methods would make his income adequate to repay the loan. In such cases where the farmer works out a farm plan that will bring the needed increase in his income, the government will offer special assistance. During the first five years of the loan if the adjusted farming plan is carried out, up to half the principal payment and all of the interest due may be paid by the Government.

For the farmer whose income is not adequate to repay a loan and whose farming operations cannot be changed enough to make the income adequate, assistance will be available if existing housing is considered a menace to the health or safety of the occupant or the community. In these cases loans and grants may be used for needed minor repairs which will provide safe or sanitary housing. The total amount of grants may not exceed $500, however, nor may the total of grants and loans for such minor repairs exceed $1,000.

When necessary, loans may be made to enlarge or develop farm land to help provide income needed to pay off a housing loan.

The program during its first year is expected to start slowly, with total authorization nationally of $25 million for construction and repair loans and an additional $2 million for loans and grants for minor repairs and loans to enlarge or develop farm land. It is estimated that this will provide funds to help about 13,000 farmers--about 5 per county. The program, however, is authorized to continue for four years, with a total authorization of $275 million in loans and grants over that period. If appropriations match authorization, this would permit helping about 135,000 farm families nationally--an average of about 50 in each county during the four years.

Supervisor _____ said that these loans, to be made through his agency and approved by the Farmers Home county committee, are only part of the aid which the new Act holds out to farmers. The Agricultural Research Administration is authorized to work out research on new materials and construction methods. This information, plus building plans for various farm construction, will be made available to farmers through the County Agent. In addition, The Bureau of Agricultural Economics will make special surveys to determine farm construction needs.

* * * *

(Ten-minute talk which can be used to explain the new Housing Act to civic, service, farm, church or veteran groups in your county. If used after funds are appropriated, omit or change paragraph two.)

(INTRODUCTORY REMARKS WHICH MIGHT BE A LOCALIZED ADAPTATION OF THE FOLLOWING:)

It is always a pleasure to appear before the _____ Club, because I have found your group not only civic-minded but ever willing to help when you see a problem which requires willing hands to solve. I think we have such a problem in _____ County, and some new legislation just passed by Congress and signed by the President July 15 provides part of the answers. But your help is needed, too; and so I am happy to have this chance to explain the way the new Housing Act will work in providing farm housing. Then: --

First, I'd like to make one thing very clear to all of you. The Housing Act of 1949 authorizes a national farm housing program which includes $275 million in loans and grants over a four-year period for repair or construction of farm buildings. Right now we don't have the money to make those loans. We're waiting for funds to be appropriated, and even then the program may start slowly. Only $27 million of that 4-year total is authorized during the first year. _____ County's share during the first year, therefore, might be only enough to make 5 loans, but in the four-year period we might make ten times that many.

One of the ways you folks can help then, is to see that these loans are used to the best advantage of the whole county. The loans must be made where they will do the most good, where they are needed most, where other forms of credit can't do the job. If a farmer needs new housing and can get the money from the bank here in _____, then the bank should have first chance at the loan. But if the family can't obtain private credit, and if their present housing is such that it is holding back their farm progress, or is a menace to their health or safety--or to the health and safety of the community--then federal funds must be made available to help them.

I'm sure you have already heard most of the details of this new program over the radio or read about it in your newspapers, so I'll just sketch hastily some of the key points. And I've brought along with me some copies of a fact-sheet which will supply information in a nutshell about the whole program. Any of you who are interested, or who knows some farmer who might be interested, can obtain copies after the meeting. (NOTE TO SUPERVISORS. A COPY OF THE FACT-SHEET IS ATTACHED, AND MAY BE MIMEOGRAPHED IN WHATEVER AMOUNTS YOU WILL NEED TO HAND OUT AT MEETINGS SUCH AS THIS OR TO GIVE TO APPLICANTS WHO CALL AT YOUR OFFICE.)

First, however, let's discuss the need for such a program. You hear a lot about city slums, but most people think of the country as a healthful, safe, prosperous place to live. But that isn't always so. Here are a few statistics which may surprise you. . .Only 4 percent of city homes are overcrowded--that is, they have more than 1½ persons per room. But 10 percent of our farm homes are overcrowded. Ninety-eight percent of all city homes have electric lights,

but only 60 percent of the country homes have them. Only 32 percent of the farm dwellings have running water, and 20 percent have flush toilets as compared to 96 percent and 84 percent respectively in the city.

I don't expect you'll remember those figures, and the actual figures themselves aren't too important. What is important is that only about one in every six farm dwellings have the things which city families consider as bare minimums for adequate, healthful, American living.

This new Act makes it possible to see that a lot of country-folk will now have the same good American standards of living as their city-cousins. And it's probably the only way most of them would have this opportunity. It's perfectly true that there has been a lot of construction, recently, out in the rural areas. A recent BAE survey shows that new houses were under construction on almost a quarter million farms in 1947. But there are about 6 million farms, and the census of 1940 showed that almost half of them did not meet the Housing Act standards of decent, safe and sanitary housing.

Since 1940, you know, we've had a long war, during which very little or no construction was done, and so those three million bad farm dwellings didn't get fixed up, they got a little worse instead. And since the war, with labor and materials expensive, and with average gross farm income less than $1,500 in the good year of 1945, what construction has been done has all been on our better farms, not on those which need it most. Our banks today have money to lend for housing construction, but too many farm families haven't the chattels or other security necessary to make such a loan a good investment to the banker.

So. . .it seems that government aid is necessary for this bottom-half of our farmers; and the new Act provides it.

Here, summing up, is what it provides:

If a farmer needs new construction or repairs on his farm home or other farm buildings, and if his income from farm and other sources indicates he will be able to repay the loan, and if he can't get a private lender to lend him the money for such construction, then he can probably get a federal loan to do the job. If he is approved by a committee of three local farmers, that is, and if his farm produces at least $400 worth of products for sale or home use. That $400 is based on 1944 prices, by the way, and would figure about $550 at present prices.

If he gets the loan, he has up to 33 years in which to repay it, although the term may be shorter for small loans. He pays principal plus 4 percent interest annually; but if he has a bad year through no fault of his own, he doesn't lose his farm. What happens is that the government allows a moratorium of principal and interest for that year. In extreme cases, the interest may be forgiven entirely.

Of course all farmers who need these loans don't have enough income from farm or other sources so they will be able to repay the loan without some additional help from government. For these folks, two different ways are provided. First,

it may be possible to change the farmer's operations or enlarge his farm so he can repay the loan. That type of an applicant is called one with "potentially adequate income". For him, we help work out a farm and home plan that will increase that farm income, and if he agrees to the plan, make the loan. And if he sincerely tries to carry out the plan and is still short of income while the new plan is being developed into a paying proposition, the Secretary of Agriculture may contribute toward his payments during any of the first five years, a sum up to the total amount of interest and half the principal due.

If his farm just isn't capable of being made to produce enough income to repay the loan, but if its present housing is a source of danger to the health, sanitation, or safety of the family or the community, a loan might still be made in whatever amount he could repay. He could use it only to make minor repairs such as installing screens or providing an adequate roof. Actually he might even receive an outright grant to do this minor repairing. But the total amount of grants to any one family may not be more than $500; and the total for minor repairs, whether it is loans and grants or loans alone, may not be more than $1,000.

Whatever type of loan is provided, it may be made only to farm owners, although owners may use the loans to provide decent housing for their tenants or workers.

Of course I've talked mostly about the loans which will be available under this new program as soon as money is appropriated. That's because I'm with the Farmers Home Administration, and our agency has been selected to make these loans and to service them. But there are other branches of the Department of Agriculture that will help, too. The Agricultural Research Administration, for example, will do housing research to discover new methods of construction, or to test out new materials. The Bureau of Agricultural Economics will make periodic surveys to determine the need for this housing program, and help see that the public gets the most use out of each appropriated dollar, that is, see that the money goes into areas where it is needed most, and to correct problems which are most urgent. And the Extension Service has a mighty important part in the program, too. It will have available plans for construction available both to persons who obtain loans from the government and to farmers who use local credit. The County Agent will not only provide these plans but will also pass on the information worked out by the research agencies.

Well. . .that's the new housing program. With more experience it may be necessary to change some of the provisions or ways of doing the job; and that's one reason for starting in a small way the first year. And that's also the reason why we want you folks to help work out the kinks and interpret the experience.

There will be some benefits in it for you, too. These loans for farm construction will be money spent for labor and materials right in our own community. Because of the improvements made on the farm, property values not only of that farm but of the whole community will be improved. In many cases, the improvement will help the farmer increase his income, and that will be more money coming in to the local community, too. What I'm trying to say, as a sort of summary, is that this is a program that will help the farm family, but it merits your support because it will help you and the whole community, too.

UNITED STATES DEPARTMENT OF AGRICULTURE

FARMERS HOME ADMINISTRATION

Atlanta National Building
Atlanta, Georgia

October 7, 1949

Mr. George Mitchell
906 Lullwater Road
Atlanta 6, Georgia

Dear Mr. Mitchell:

As requested by you over the telephone today, we are enclosing a copy of Public Law 171-81st Congress and a copy of a "Fact Sheet on Farm Housing Loans." We trust that this material will fill your needs.

Sincerely yours,

J. D. Whiteside
Acting State Director

Enclosures (2)

FACT SHEET ON FARM HOUSING LOANS

The Housing Act of 1949 authorizes government loans to help farmers construct or repair houses and other farm buildings. It also authorizes a limited number of grants to correct housing defects which are dangerous to the health or safety of the farm family or the community.

The program will not be placed in operation until funds are made available by action of Congress.

ELIGIBILITY

To be eligible for a loan, a farmer must be unable to get needed credit for housing improvements from other sources. Loans can be made only to farm owners, but landlords may use the loans to provide better housing for tenants, sharecroppers or farm laborers. Veterans have preference.

TYPES OF LOAN ASSISTANCE

A loan may be made to a farmer whose income from farm or other sources is considered sufficient to repay the loan plus interest without further assistance from government. A loan may also be made where the farmer's income is considered inadequate if the borrower agrees to revise his farming operations or make other improvements to protect the government's interest, and if such changes will make his income adequate to repay the debt on schedule. In this case, the government may forgive the interest and up to half the principal due during the first five years if the borrower is unable to make full payments and if he is following the improvement program outlined at the time of making the loan. A loan may also be made to enlarge or improve farm land to make the unit capable of producing income that, combined with income from other sources, will repay a housing loan and sustain the family.

TERMS OF LOANS

Loans are repayable in a maximum of 33 years at 4 percent interest. A moratorium on principal and interest payments may be granted when, because of circumstances beyond his control, the farmer is unable to make scheduled payments. In extreme hardship cases, interest may be cancelled during the moratorium.

HOW TO APPLY

When the program is placed in operation applications will be filed at local offices of the Farmers Home Administration, usually located in the county seat. The eligibility of all applicants must be certified by the local county committee of three farmers before loans may be made.

EXPERIMENTS IN RAMMED EARTH CONSTRUCTION

by the

Farm Security Administration
U. S. Department of Agriculture

Seven houses near Gardendale, Alabama, about 13 miles from Birmingham, have been constructed of rammed earth as an experiment in, and a demonstration of the use of, rammed earth as a construction material. The experiments were conducted under the supervision of Farm Security Administration engineers and the following information is taken from the reports of these engineers and from conversations with families who now occupy these houses.

Rammed earth as a construction material was chosen after the investigation of a variety of old and new building systems. The history of its use dates from ancient times. Examples and records exist of structures built of this material which have endured centuries of weathering and use, in all parts of the world and under the most extreme range of climatic conditions.

Investigation by Farm Security Administration engineers showed that suitable earth was available almost everywhere in this country. It appeared probable, therefore, that with such a material, which is both cheap and durable, houses could be built at a cost within the means of low-income families.

Since labor is the principal factor involved in the erection of such buildings, it was found that a much greater percentage of the construction cost would go for wages than is usually possible in building with brick or wood.

Rough estimates have been made on the cost of rammed earth houses at Gardendale, Alabama. A three-bedroom house with 22,500 cubic feet was built at an approximate cost of $.122 a cubic foot. Materials cost $1,050 and the cost of labor amounted to $1,700. A two-bedroom house with 17,000 cubic feet was erected at a cost of $.12 a cubic foot. The cost of materials was $750, and the cost of labor, $1,300.

The experimental work was divided into three phases:

1st. The determination of the physical character and capacity of the material.

2nd. The development of a system of design which would take advantage of these characteristics.

3rd. The development of an organized method of building which would increase efficiency and reduce cost.

Test blocks, 9" x 17" in area and 5" in depth, were subjected to compression loads to the point of failure. The ratios of sand, clay and coarse aggregate were varied, while the moisture content was kept constant at 11 percent. All blocks were dried for thirty days before testing. Their compositions, together with loads at point of failure, were as follows:

Block

A - 3 parts sand, 2 parts clay, and 1 part aggregate - 76,000 lbs.
B - 3 parts sand, 2 parts clay, and 1 part aggregate - 56,000 "
C - 3 parts sand, 2 parts clay, and 1 part aggregate - 41,000 "
D - 3 parts sand, 2 parts clay, and 1 part aggregate - 96,000 "

The average for this series of identical mixtures is-67,000 "
in excess of 33 tons per square foot - over 450 lbs. per square inch.

E - 3 parts sand, 1 part clay, $1\frac{1}{2}$ parts aggregate - 76,000 lbs.
F - 6 parts sand, 4 parts clay, 1 part aggregate - 69,000 "
G - 1 part sand, 1 part clay, no aggregate - 27,000 "

Additional tests were made to determine the effect of various admixtures - lime, Portland cement and asphalt. The addition of lime or Portland cement appeared to have no effect on the strength of the block. Asphalt emulsion added at the rate of 15 percent of the material passing through a 200 mesh screen increased the toughness of the blocks and made them considerably more impervious to moisture.

From the data obtained, a general rule for the composition of rammed earth may be stated: The clay content should not exceed one-third, nor the aggregate be less than one-sixth of the whole. The ratio of sand to aggregate may be varied to suit local conditions, but in no case should the aggregate present exceed the amount of sand. The moisture content should be held rigidly between 14 percent and 8 percent, but 10 percent to 11 percent gives the best results. Admixtures are not required and do not justify their cost. Aggregate should not be larger than 1" in diameter but may be of almost any material - gravel, slag, shale or crushed rock.

To obtain proper material, it is necessary to remove all top soil containing vegetable matter or roots. Samples should then be taken at varying depths and analyzed for sand, clay and aggregate content. Such investigation will usually locate earth satisfactory for rammed blocks. If any deficiency occurs, it is usually lack of coarse aggregate and this can be overcome by adding gravel or crushed rock to the natural earth. The moisture content will necessarily vary from day to day. When too much water is present the earth may be dried by spreading it in the sun, or by heating it over pit ovens. In extremely dry weather water may be added. The most satisfactory method of adding water is to pour it over the surface of the ground

at night, allowing it to seep down naturally into the mixture. A rough but satisfactory test of the moisture content can be made in the following manner. Knead a ball of earth with the hands and drop it to the ground. If the ball shatters, the moisture present is satisfactory. If it fails to shatter, there is too much water in the mixture. Insufficient water content will make it impossible to mold a ball.

While it is possible, through heating the material, to work through the winter months, this procedure is not recommended when frost is present. Rammed earth has great strength in compression (in excess of 30 tons per square foot) but it does not have much strength in tension. For this reason, all walls or columns which have tension stresses or are subject to bending should be avoided.

Different surface textures on the wall may be achieved by varying the interior facing of the forms. With care a wall can be made as smooth as rubbed concrete. The natural wall, however, with its slight imperfections, is cheaper and more effective architecturally. When the earth wall has been compacted and the forms removed, the wall surfaces will readily shed rain without serious washing or erosion, but water allowed to seep down through the center of the wall from above, or up from below, will eventually destroy it. For this reason all walls should be set on damp-proofed foundations and the upper surfaces of walls should be covered during construction and protected until the roof is in place.

In addition to its high bearing capacity, rammed earth has another feature particularly advantageous for house construction. This is its extremely low thermal conductivity. A 12" to 15" wall has a thermal conductivity of approximately zero, which makes it possible to build a house that will be cool in summer and easily and cheaply heated in winter.

After a wall has dried for at least thirty days, the exterior and interior surfaces may be treated. Interior walls may be painted, whitewashed, or plastered. Where the wall surface has been rubbed down and thoroughly wetted, it furnishes a good surface for the retention of plaster. For lowcost housing, a painted or color-washed interior wall is satisfactory and materially cheaper. The exterior wall may be treated with almost any kind of water-proofing material - boiled linseed oil, or tung oil, with or without pigment. Sodium Silicate may be applied. Paraffin dissolved in benzine and sprayed on at a temperature of 70° is satisfactory. Cement stucco applied to a roughened wall is recommended by many authorities, but to date our experiments in the use of it have not proved successful. Smooth finished stucco is both expensive and subject to cracking. A cheap and adequate finish may be made as follows: Add 5 pounds of casein glue to 2 gallons of boiling water, dissolve 3 pounds of trisodium

phosphate with 3 gallons of water. Mix together the trisodium phosphate solution with the casein glue and add this mixture to a lime paste made of 50 pounds of hydrated lime in 8 gallons of water, stirring the whole thoroughly. Just before using, add 3 pints of formaldehyde dissolved in 3 gallons of water. This formaldehyde solution should be added slowly just before use. The whitewash can be colored to any tint by the addition of dry pigment, and may be applied to the wall in a spray. The color-wash should be applied only on the shady side of the house, or the work may be done on cloudy days. In especially dry weather, the color-washed wall should be sprayed with water to allow the mixture to cure slowly. This cover effectively seals the wall, and is the least expensive of any of the waterproofing compounds in cost of materials and application.

The second general problem in the experiment was the choice of a design which would take full advantage of the character of the material. Since the material is crude and heavy, all unnecessary detail should be eliminated and the wall forms kept as simple as possible. Experiment shows that a 12" wall thickness is adequate for one story buildings, but 15" is recommended since the reduction of the wall thickness below this size has a tendency to cramp the workmen and decrease their production. In general, rammed earth walls should be one and one-half times the thickness required for brick walls.

Although buildings of two or even three stories in height have been built, the labor involved in raising so heavy a material to any great height offsets its low initial cost. A rule of thumb to determine an economical wall height is to limit it to a height which will permit the loose earth to be thrown into the highest forms without the use of more than one stage.

While examples of arch construction and even of flat arch lintels exist, it is not advisable to carry the wall over openings. If structural horizontal top pieces or lintels are required for doorways or window openings, it is more satisfactory to make them of concrete. It is better, however, to avoid these lintels within the wall altogether. The horizontal top member on the wall or plate, reinforced according to the loading, will serve as a lintel and eliminate both difficulty and cost.

Since the wall is heavy, continuous concrete foundations should be provided the full width of the wall and these should be reinforced to prevent bending.

Floors may be of any type desired. Concrete slabs poured directly on the ground, waterproofed and finished with linoleum, tile, or wood, are most satisfactory. Joist construction may be used, the joists either recessed into the wall, or, better, supported on a sill. Wood nailing blocks may be inserted in the wall where they are needed and rammed in place. If such blocks are used they must be thoroughly impregnated with creosote. They are, however, unnecessary since it is possible to nail directly into the wall after it has dried and secure a firm and rigid hold.

within the limitations of these rules, there is considerable freedom in the design of structures. Although the material is heavy and crude, fine architectural effects can be attained by the manipulation of form and color. Any attempt at refinement of superficial detail will prove both unsatisfactory and expensive.

In the development of an organized method of construction, various types of wall-form in thich the earth was rammed were tried by Farm Security Administration engineers. The most satisfactory consists of horizontal side panels made up of 2" lumber, strongly braced vertically every three feet. Wrought iron bolts, 1½" size, are inserted through the vertical braces 6" from each top and bottom. These bolts, being threaded and capped with a nut on one end, serve to draw the two side panels together to the desired thickness of the wall. Approximately 30" is the most convenient height for side panels. End gates or bulkheads are built the full height of the intended wall from foundation to roof. These serve to keep the side panels in alignment and at the same time form the openings.

The design of forms must be strong and true, both vertically and horizontally. Since the materials recommended for form construction are heavy, it is inadvisable to make form sections too long. Generally, section sizes should be no larger than can be easily handled and raised by a crew of four men. As it is necessary to repair and re-condition forms from time to time, duplicates of each type should be kept ready for use. It is important that the initial setting of the form should be in perfect alignment and the openings spaced according to the plan. A tolerance of 3/4" in a five-foot opening is sufficient to take care of any variations and allow for the easy setting of door frames.

For practically any type of building, the only forms needed are a right and left hand ell, a straight line, and a tee.

Once the forms have been set and aligned, they are ready to receive the loose earth. Tests having been previously made and the location of suitable earth determined, a crew is set to digging and mixing the selected material. Clods should be broken up and, if necessary, either water or coarse aggregate added.

The prepared earth is then placed in the wall forms in layers approximately 3" deep. This depth of layer should be carefully adhered to, since greater amounts not only make the work harder but tend to cause soft spots of inadequately rammed earth to occur in the wall. Workmen who are doing the ramming stand in the wall forms and pack the earth with ramming tools. The ramming or tamping of the earth is a kneading rather than a pounding motion, and contrary to what one might expect is neither tedious nor tiring once the workman has acquired a certain rhythm in his work.

After experimenting with various sizes and shapes of rammers, a standard

type was developed which appears most satisfactory. It is made from 4" x 10" x 18" block of hard wood, with one 10" face sloped to have a tamping edge 1½" x 10". A wrought-iron pipe threaded into the block serves as a handle. The tool weighs approximately 18 pounds.

After the earth is rammed hard, it will compress to approximately 50% of its loose volume. It is sufficiently compacted when the upper surface will take but a slight impression of the ramming tool. When one layer has been rammed, a new 3" layer is spread in the form and the work continued until the form has been entirely filled.

The bolts are then taken out and the side panels raised, no waiting time being required for the setting of the material. It is well, however, to have the forms so designed that at each raising an apron of at least 6" overlaps the newly made wall. This will prevent bulging and cracking. The process of filling, ramming and raising forms is continued until the wall has reached the desired height.

At this point it has been found advantageous to trim the wall top by filling in the last 2" of the form with concrete. This serves to protect the top of the wall and to provide a level bed for the plate. During the raising of the forms the end gates or bulkheads remain constantly in place and are not removed until all the forms have been taken down.

It is a good idea to place a triangular strip approximately 3" across the face in all outside corners. This serves to round or chamfer the wall corners and prevents their being chipped on the edges.

The work of a crew of 14 men is best allocated as follows:

4 men to dig and mix the earth,
2 men to deliver it into the forms,
6 men to tamp,
2 men to change forms.

The operation of changing forms requires the greatest skill, since it involves not only the raising of the form itself, but the maintenance of alignment and level. The mixers of the earth must be taught to maintain a constant composition and to recognize changes in strata. The rammers usually work in pairs and the average rate of production of wall is approximately two-thirds of a cubic yard per man per day, counting the whole crew, whether mixing, ramming, or changing forms.

Such plumbing, pipes, or wiring conduit as may occur in the wall may be set in the form and rammed in place, or the wall may be grooved for their insertion after completion.

In addition to the experiment on the earth wall itself, investigation into a number of roof types was made and a roof structure designed

which is particularly suitable and inexpensive. This consists of a wood joist construction, the joists being spaced according to the span and extending out beyond the wall approximately 20". They are covered above with a wood deck upon which is laid a dead level tar and slag composition roof. A galvanized iron gravel stop extends down over the outside face of the wall (facia) and turns back under the eaves (soffit). This protects the roof structure and forms a drip.

The soffits were variously treated, some being finished with cement plaster and others with tongue and groove boards. In the interior the joists are stripped below with 2" nailing strips (furring), upon which is hung gypsum board lath and plaster. The roof structure so constructed is itself an integral air chamber which may be ventilated either in the soffit or through vents built up on the roof.

It was found that the temperature within this air space was from five to eight degrees higher when the upper roof surface had been colored black than when this surface was white, this being due to the greater heat absorption of black over white. Due to this difference in temperature and to the consequent tendency of the warm air to rise, a slight air current is set up, which draws the warm air off the room ceilings through ceiling vents.

This type of roof structure is fire resistant and can be built and maintained at a cost materially less than is required for any type of pitched roof.

Each of the experimental houses was provided with a barn and a well-house. The barn consists of a central garage space flanked on one side by a cow stall and a tool room, and on the other by a chicken house and a feed storage room. At the end is placed a hay rack. The bearing structure of the barn is made up of rammed earth columns.

The roof is similar to that used on the houses with the exception that the ceiling is not plastered. The upper third of the space between exterior columns is filled with wooden slats, which provide ventilation and light. The lower panel is covered both inside and out with corrugated galvanized sheet iron. The interior partitions are of sheet iron on studs. A barn so built is fire resistant, easy to clean and maintain, and requires only rudimentary skill for its construction.

The pump houses in addition to providing for well, pump, and water tanks, contain storage space for coal, vegetables and roots and a cold storage room. This latter has a cork and rock wool lined ceiling and an insulated refrigerator-type door.

A review of the rresults attained by this experiment in rammed earth construction indicates that it is possible to build:

1. A house of such sturdy character that it will last indefinitely. Such maintenance as is necessary can be performed by the owner at a minimum cost.

2. A house so insulated that it is exceptionally cool in summer and easily and cheaply heated in winter.

3. A house which can be built in some areas and under certain conditions for approximately two-thirds the cost of frame dwellings of comparable space and functional design.

The method of construction and finish outlined above requires but a limited number of skilled workmen, whereas an exceptionally large number of unskilled workers are given employment. The ratio of skilled to unskilled workmen needed is approximately four unskilled to one skilled and this without performing with unskilled labor any part of the work which is normally and properly in the field of skilled labor. This may be compared with the corresponding ratios on brick or wood construction, where four skilled laborers are required to each unskilled worker.

The ratio of labor cost to the cost of materials is also favorable, approximately seventy cents of each construction dollar going to wages as compared with thirty to thirty-five cents for wages on houses built of brick or wood.

United States Department of Agriculture
War Food Administration
Farm Security Administration - Region V
Information Division - Montgomery, Ala.

The Farm Security Administration in 1939 constructed ten houses with cotton duck used for the roof and exterior walls, to test the use of this material for home construction in the southeast. Two of the houses were built in Coffee county, Alabama, two in Okaloosa county, Florida, and six labor camp shelters in Palm Beach county, Florida. The cotton duck was donated by the Federal Surplus Commodities Corporation.

The labor camp shelters and the houses in Okaloosa county, Florida, were carefully maintained and today are none the worse for wear.

The two houses in Coffee county, Alabama, were allowed to stand without repair or maintenance until this year. It was found that after five years the cotton duck on these houses was still in good condition except that both units required a coat of paint and the roof on each unit had developed a split in about two places. This condition can be easily remedied by placing another piece of cotton duck where the splitting has occurred. No splitting occurred on the side walls. Mildew developed on the sidewalls of one house in Coffee county due to shrubbery being planted too close to the house.

According to Michael L. Mascia, district engineer of the Farm Security Administration, cotton duck requires the same protective painting that is required for the maintenance of frame dwellings. In the opinion of Mr. Mascia the cotton duck, if properly maintained, should last as long or longer than any of the component parts of the house. The experimental houses have shown that a coat of paint every four years would be required. The weather resistent properties of cotton duck are well known inasmuch as the Navy has long used this material for ship decking.

The cost of each house in Coffee County was approximately $1,300 excluding the value of the cotton duck. The duck at that time was valued at about $150.

Plywood of 3/8 inch thickness, which comes in four feet by eight feet sheets, was used for the interior walls, ceiling and for the roof sheeting. It was also used as backing for the exterior walls. A fire resistant compound was applied to the exterior walls and to the roof, and the cotton duck, weighing 24 ounces to the square yard, was thus glued to the walls. The duck was nailed at the edge and the nails overlapped at the seams.

The Coffee county houses each have three bedrooms, living room, a combination kitchen and dining room, a large pantry, a work porch, a front porch and large closets in each bedroom. Two of the bedrooms are 10 by 12 feet. The other bedroom is 11 feet by 12 feet six inches. The kitchen and dining room is 11 feet six inches by 18 feet. The living room is 13 feet six inches by 11 feet six inches, while the work porch is eight feet six inches by seven feet. The pantry is four feet six inches by five feet.

The overall dimensions are 23 1/2 feet by 40 feet. The height from the grade line to the eaves is 10 feet seven inches, and to the ridge, 18 feet.

The use of plywood for exterior wall backing and for interior walls and ceiling is within itself almost enough to make the house air tight. With the addition of the duck the house is so tight that it is difficult to close a closet door without first opening a window. A small fire in the fire place in the living room is all that is necessary to heat the house comfortably on the coldest day. The same insulating properties also make the house much cooler in the summer.

One of the cotton houses is located two miles north of Elba on the Troy highway. The house and farm of 97 acres have been purchased by C. W. Hall upon the same credit terms as provided in the Bankhead-Jones Farm Tenant Act. Mr. Hall

was enrolled in the rehabilitation program of the Farm Security Administration. This house has not been repainted or repaired since it was constructed to test its durability, and only recently deterioration of the roof began to show up with a leak here and there. The FSA sought to obtain some of the fire resistant compound to re-glue the roof seams but found that a AA-1 priority would be required for this critical material. The cotton duck showed its first signs of mildew more than a year ago and the house shortly will receive a fresh coat of paint from the owner. Mr. Hall purchased the house and farm last May.

The other house is located about 10 miles from Elba in the Victoria community. It is occupied by E. H. Wise who purchased the house and farm of 230 acres last year. Early during 1944 leaks also appeared in the roof of this house which had not been repainted or repaired since it was constructed. Mr. Wise, being unable to obtain any of the fire resistant compound and assuming that the cotton duck roof had outlived its usefulness, purchased asphalt shingles. In removing the cotton duck roof, however, he found that the duck was still strong and durable and regretted his decision in purchasing the shingles. This house now has an asphalt shingle roof, and the side walls have been repainted.

Mr. Wise, incidentally, will make his final payment on the 230 acre farm this year. He was enrolled in the rehabilitation program in 1937, and at that time one cow, a few hogs and household goods were his worldly possessions. When he purchased the farm last year for $2,350, Mr. Wise paid $1,150 cash. This year he made nine tons of peanuts for which he received $160 per ton, three bales of cotton, and marketed 12 hogs which brought him around $300. The farm which Mr. Wise has purchased is part of a tract of land which at one time was owned by his wife's father, who lost it through foreclosure on a mortgage held by the Federal Land Bank during the depression.

RAMMED EARTH

Farmers' Bulletin 1500, Rammed Earth Walls for Buildings, outlines the principles involved in the use of rammed earth or Pise' de Terre for wall construction. A copy may be purchased only from the Superintendent of Documents, Government Printing Office, Washington, 25, D. C. for five cents in coin.

Professor Ralph L. Patty, Department of Agricultural Engineering, South Dakota Agricultural Experiment Station, Brookings, South Dakota, has issued the following bulletins. Write to him direct regarding their availability and price; also arrangements can be made with that institution for testing samples of earth for a nominal price. THE UNITED STATES DEPARTMENT OF AGRICULTURE DOES NOT MAKE SUCH TESTS.

Rammed Earth Walls for Farm Buildings, by Ralph L. Patty and L. W. Minium, South Dakota Experiment Station, Bulletin 277, 1933. (Rev. 1938).

The Relationship of Colloids in Soils to its Favorable Use in Pise' or Rammed Earth Walls. R. L. Patty, South Dakota Agr. Experiment Station, Bulletin 298, 1936.

Paints and Plasters for Rammed Earth Walls. R. L. Patty, South Dakota Agricultural Experiment Station, Bulletin 336, 1940.

BMS 78, Structural Heat-Transfer and Water-Permeability Properties of Five Earth-Wall Constructions, describing tests conducted by the National Bureau of Standards on both rammed earth and adobe walls, is available only by purchase direct from the Superintendent of Documents, Government Printing Office, Washington, D. C., for 20 cents in coin. Stamps not accepted.

Directions for using portland cement as a stabilizer in rammed earth construction are given in a publication entitled, Terracrete, Building with Rammed-Earth Cement, obtainable only from the author, Mr. Francis Macdonald, Chestertown, Maryland, for $1,00 per copy.

A laboratory handbook entitled, Soil-Cement Mixtures, contains directions of a technical nature for testing soil-cement mixtures for road paving - the same procedures are useful for testing soils for buildings. The publication does not deal with rammed earth. Available from Portland Cement Association, 33 W. Grand Avenue, Chicago, Illinois, (Technical).

Clearing House Release, No. 20
American Council on Race Relations

March 11, 1946

RECEIVED
MAR 18 1946
Southern Regional Council

TO Correspondents of the Clearing House:

In our Release no. 19 last week, the Clearing House called attention to the Veterans' Emergency Housing Program outlined by Wilson W. Wyatt, Housing Expediter, in his report to President Truman.

We are now sending you a statement on this program because the urgency of meeting the housing needs of minorities calls for swift and concerted action by all interested groups. The statement and proposals were prepared by A. A. Liveright, executive director, and Robert C. Weaver, director of Community Services of the American Council.

The Clearing House will welcome a report on your experience in putting these proposals to work and will be glad to help any group wishing further information or suggestions for action in specific situations.

Statement on the Wyatt Housing Program

The Program

Wilson W. Wyatt, National Housing Expediter, has announced a bold and workable plan for veterans' housing. The program calls for the construction of 2,700,000 low and moderately priced homes during the next two years, for the enactment of national legislative measures to implement the program, and for the action of local government and of all community groups in setting up local programs.

While this program is designed to take care of the immediate needs of war veterans, it involves more than emergency housing. The Veterans' Emergency Housing Program has wisely been integrated into the long-run approaches to the total problem of housing. It will therefore establish the basis and set the patterns for all future postwar housing activities. If the needs of minority groups are to be adequately met, they must have full consideration before policy on local programs becomes fixed. Experience has proved that an increase in the total volume of homes does not itself guarantee a proportionate increase in the number of homes available for minority groups nor does it assure integration of all veterans--regardless of race, creed, or national origin--into non-segregated housing.

Wyatt's program depends upon the enactment of the Wagner-Ellender-Taft and the Patman bills. Negroes, Japanese Americans, Mexican Americans, and other minority groups have a stake also in this aspect of the program, for these bills provide extension of public housing and effective devices to keep prices from rising.

In all his discussions, Wyatt has emphasized that this is essentially a local program. Local government must therefore assume responsibility for meeting equitably the housing needs of minorities in each community, and the federal government must guarantee adequate administrative assistance to local governments.

Each community will have a local Emergency Housing Committee, to be appointed by the mayor. Mr. Wyatt has said, "these committees will be composed of representatives from local government, veterans, labor, builders, building material producers, financial institutions, chambers of commerce, and other interested groups." It is important to note that the statement does not specifically include representation of Negroes or other minority groups.

Proposals for Local Action

Minority groups themselves, as well as labor, veteran, church, and other civic organizations will want to look into the full Wyatt program and the associated legislation to determine what they must do to assure equitable administration of the program in their communities. It will be up to these

groups to see that local government discharges its obligations in meeting the housing needs of Negroes, Japanese Americans, Mexican Americans and other minorities in each community; and that the federal government retains such administrative control over local programs as will guarantee adequate assistance to local governments in carrying out the program.

Specifically, the following proposals are made for action by these groups to insure "homes for all veterans who need them for themselves and their families--regardless of race or creed":

1. Insist on minority group representation on the local Emergency Housing Committee.

   In the selection of such representation, attempt to choose independent, capable, and forceful people. Persons already employed in city government or associated with the local housing authority should not be chosen for the committee.

   It is important to avoid factional competition in the selection of candidates. Effective representation will be most readily assured if cooperating groups can present the names of several competent persons, as a joint recommendation of broadly representative and influential minority and civic organizations.

2. Assure equal service to minority group war veterans in local Veterans' Housing Information and Referral Centers.

   It is in the centers that the "racial pattern" of housing in the local community is shaped. Policies and practices must be established in these centers that will assure adequate service for minority veterans and that will assure the community the most advanced practice. In the North, ways have already been found to establish democratic interracial housing under the veterans program. Community groups must take the lead in seeing that the Veterans' Housing Information and Referral Centers are set up to make this possible in northern communities.

   The selection of staff for the centers is of course crucial to the carrying out of policy. In the South, branch offices completely manned by Negro personnel are perhaps the only feasible and equitable means of providing adequate services; in the Southwest, needs of Spenish-American veterans must not be ignored, and qualified Spanish Americans must be employed in the centers. In northern, eastern, and western sections of the country it should be possible to insist on interracial staffs for all central and branch offices.

3. Press now for inclusion of minority group veterans in the apprenticeship training program in the building construction trades, as well as for fair employment of those already qualified.

   Local groups should be watchful of federal regulations and programs to release more men for apprentice-training, on the one hand, and of local practices in the vocational shcools and building trade unions, on the other.

The concerted action of all groups working for better race relations can help materially to shape the housing program in local communities.

DEPARTMENT OF COMMERCE
Bureau of the Census

July 31, 1946 Population: HVet-No. 11

Survey of Housing of World War II Veterans and Dwelling Unit Vacancy and Occupancy in the Macon Area, Georgia

How veterans are living

About two-fifths (37 percent) of the estimated 4,200 World War II veterans living in the Macon area during the early part of April were doubling up with relatives or friends, according to the results of a sample survey released by Director J. C. Capt, Bureau of the Census. The survey, made at the request of the National Housing Agency, further shows that almost three-fifths (58 percent) of the veterans were living in dwelling units for the exclusive use of their immediate families and the remaining few (5 percent) were living in rented rooms or hotels. One-third of the veterans lived in dwelling units which needed major repairs or lacked one or more of the standard facilities--electric light, running water, private flush toilet, and private bath.

The survey indicated more doubling up among the Negro veterans than among white veterans. Forty-four percent of the Negro veterans were doubling up as compared with 33 percent of the white veterans.

What they plan to do about their housing

Of every 100 veterans, 71 plan to remain in their present quarters for the next 12 months, 8 plan to move and rent a dwelling unit, 13 plan to buy or build a house, 1 plans to move into the home of a relative or friend, and the remaining 7 plan to leave the Macon locality. Among those who plan to move and rent, the average (median) gross monthly rental they would be able to pay was $24 and the average size unit they desired was four rooms. Among those who plan to buy or build, the average (median) price they said they would be able to pay was $5,000 and the average size house they desired was five rooms.

Proportionately fewer Negro veterans reported they planned to buy or build than white veterans. Ten percent of the Negro veterans would buy or build as compared with 14 percent of the white veterans. Negro veterans would be able to pay an average (median) price of $2,100 and preferred four room houses. White veterans would be able to pay an average of $5,400 and preferred houses having five rooms.

What housing is available

The survey shows that 2.3 percent of all the dwelling units in the area, including privately financed and publicly financed dwelling units, were unoccupied. Exclusive of public housing units, the gross vacancy rate was only 0.9 percent. The gross vacancy rate among private units in Negro sections was only 0.5 percent as compared with 1.2 percent for private units in white sections.

Approximately four-fifths of the unoccupied private units were habitable. The average size of such vacancies was four rooms and one-third lacked at least one of the standard facilities. Of the habitable private vacancies, seven-tenths were rental or sale vacancies over one-half of which had already been rented or sold but were not yet occupied.

Table 1 -- VACANCY AND OCCUPANCY IN PRIVATELY AND PUBLICLY FINANCED DWELLING UNITS

CHARACTERISTIC	Public and Private Dwelling Units*	Private Dwelling Units
Estimated total number of dwelling units.....	22,402	20,000

Unoccupied.....	2.3	0.9
Habitable.....	2.2	0.7
Rental.....	1.9	0.4
Sale.....	0.1	0.1
Other.....	0.2	0.2
Not habitable.....	0.1	0.2

*The public dwelling units reported for the Macon locality includes all the publicly financed housing which serves the Macon area covered in the survey.

CHARACTERISTICS AND HOUSING INTENTIONS OF WORLD WAR II VETERANS

Personal Characteristics of Veterans

Former residence, marital and employment status

Of the 4,200 World War II veterans living in the Macon area, over three-fourths (78 percent) had lived in this locality prior to induction. Married veterans outnumbered single veterans by approximately three to two—61 percent of the veterans were married and 39 percent were single, widowed, or divorced. (See table 2 below.)

Seven out of ten (70 percent) veterans were employed. The proportion of Negro veterans who were employed was lower than the proportion of white veterans—58 percent of the Negro veterans as compared with 75 percent of the white veterans. Veterans in the "other than employed" group included those who did not desire work at the time of the survey as well as those who were seeking employment. Over two-thirds of all the veterans who were not working had been discharged since December 1, 1945.

Table 2 - PERSONAL CHARACTERISTICS OF ALL WORLD WAR II VETERANS

CHARACTERISTIC	Total	Married	Single and Other	White	Negro
Estimated total number of veterans	4,200	2,500	1,700	2,800	1,400
Percent	100%	61%	39%	67%	33%
Residence Prior to Induction					
Total	100%	100%	100%	100%	100%
Lived in locality* prior to induction	78	72	87	74	86

Employment					
Total	100%	100%	100%	100%	100%
Employed	70	81	53	75	58
Other than employed	30	19	47	25	42

*For purposes of this survey, the locality included Bibb County.

Present Living Arrangements of Veterans

Veterans doubling up

The results of the survey showed that a substantial proportion (37 percent) of the veterans were doubling up with persons other than their immediate families and a small proportion (5 percent) were living in rented rooms or hotels. The remaining three-fifths (58 percent) were occupying dwelling units with only their immediate families and possibly roomers. (See table 3 on the following page.)

Of the married veterans, over three-fifths (61 percent) occupied dwelling units exclusively with their families; of these, four and one-half times as many rented as owned. About three-eighths (38 percent) of the married veterans were doubling up and of these, about three-fifths were sharing with the veteran's or his wife's parents.

Of the single veterans, one out of ten (11 percent) lived in rented rooms or hotels. One-third (34 percent) of the single veterans were doubling up with friends or relatives other than parents, single brothers, or single sisters.

Except for the veterans who were living in rented rooms or hotel rooms, almost one-fifth (18 percent) were living in dwelling units which were overcrowded, that is, contained more than one and one-half persons per room. More than three-tenths (34 percent) of the Negro veterans were living in overcrowded units as compared with one-tenth (11 percent) of the white veterans. (See table 3.)

Condition and facilities of units

About three-fifths (62 percent) of all veterans were occupying dwelling units which were equipped with all the standard facilities and were in good condition or in need of only minor repairs, almost one-twelfth (8 percent) lived in dwelling units which needed major repairs, and one-fourth (25 percent) lived in dwelling units which did not need major repairs but lacked standard facilities. (See table 3.) The remaining 5 percent lived in rented rooms or hotels.

Of the veterans living in dwelling units which lacked one or more of the standard facilities, practically all of them lived in units having no private installed bathtub or shower, nine-tenths lived in units having no private flush toilet, one-half lived in units without running water, and one-fourth lived in units having no electric light.

80915

Table 3 - PRESENT LIVING ARRANGEMENTS, CONDITION AND FACILITIES OF DWELLING UNITS, AND DEGREE OF CROWDING FOR ALL WORLD WAR II VETERANS

*Standard facilities include: electric light, running water in unit, private flush toilet in the structure, and private installed bathtub or shower in the structure.

[1] A single veteran was not considered as living doubled up if he lived with his parents only since they were defined as part of his immediate family.

[2] Less than 0.5 percent.

Migration Intentions and Housing Plans of Veterans

According to reports from the veterans, only 7 percent of them plan to leave the Macon locality within the next 12 months—2 percent were definitely planning to leave and the remaining 5 percent were undecided but would probably leave. (See table 4 on the following page.)

Remain in present quarters for the next 12 months

Approximately seven-tenths (71 percent) of all the veterans plan to remain in their present quarters for the coming year. (See table 4.) Some of the veterans who reported such intentions were definite in their plans for the immediate future and the others were not so definite but felt that it was quite probable they would remain in their present quarters even though they may have preferred to move.

*For purposes of this survey, the locality included the Macon metropolitan district as defined in the 1940 Census.

[1] Less than 0.5 percent.

[2] There were too few single veterans in the sample who planned to move to show detailed data on their housing intentions.

30915

Move and rent a dwelling unit

Less than one-tenth (8 percent) of all the veterans planned to move from their present quarters and rent a dwelling unit in the Macon area within the next 12 months. (See table 4 on the preceding page.) About two-fifths of those planning to move and rent were married veterans who were living as roomers or were doubling up.

The average (median) gross monthly rental the veterans reported they were able to pay was $24. Six-tenths of those who planned to move and rent a dwelling unit reported they were able to pay less than $30 monthly, two-tenths from $30 to $40, one-tenth from $40 to $50, and one-tenth reported they were able to pay $50 or more monthly.

There was a great difference, however, between the gross monthly rentals Negro veterans reported they would be able to pay as compared with white veterans. About nine-tenths of the Negro veterans reported amounts less than $20 and the remaining one-tenth reported amounts from $20 to $30. Among the white veterans, only one-fifth reported rentals of less than $30, two-fifths said they would be able to pay from $30 to $40, one-fifth from $40 to $50, and the remainder would be able to pay $50 or more per month.

The average (median) size dwelling unit the veterans planned to rent was four rooms and almost one-half desired three-room units. The average (median) size of the veteran's immediate family, including the veteran himself, was two persons; for about one-fourth of the veterans planning to move and rent, the family size was three or more persons.

The gross monthly rental payments referred to above included, in addition to the contract rent, payments for heat, light, and cooking fuel. The amount the veterans indicated they were able to pay represented what they considered as a reasonable proportion of their incomes to be spent for rent.

Move and buy or build a house

Approximately one-eighth (13 percent) of all the veterans reported that they planned to buy or build a house in the locality within the next year. (See table 4 on the preceding page.) Among those who planned to buy or build, the ratio of white to Negro veterans was about three to one. Of all the prospective home owners, about three-eighths were married veterans who were doubling up or were living as roomers and an additional one-half were married veterans living exclusively with their families in dwelling units which they rented.

The average (median) price the veterans reported they were able to pay for a house was $5,000. Over four-fifths of the Negro veterans who planned to buy or build reported they would be able to pay less than $3,000, while the remainder reported prices of $3,000 to $5,000. Of the white veterans, a small proportion (about 5 percent) reported prices less than $3,000, three-tenths from $3,000 to $5,000, four-tenths from $5,000 to $6,000, and the remainder reported they were able to pay $6,000 or more.

Practically all of the veterans who planned to buy or build intended to purchase through monthly payments. The gross monthly payments veterans would be able to make, including real estate taxes, fire insurance, heat, light, and cooking fuel, averaged $40. Three-tenths of the veterans who planned to buy or build indicated they would be able to pay less than $30 monthly, two-tenths from $30 to $40, three-tenths from $40 to $50, and the remaining two-tenths reported they were able to pay $50 or more per month.

The average (median) size house the veterans planned to buy or build was five rooms and one-third of the veterans preferred six or more rooms. The average (median) size of the veteran's immediate family, including the veteran himself, was three persons; for almost one-third of the veterans the family size was four or more persons.

Reasons for moving

About two-tenths (22 percent) of the veterans planned to move within the Macon locality during the coming year. Almost one-half of the veterans planning to move were living doubled up or as roomers.

"Present quarters too crowded" was the principal reason given by the veterans planning to move. (See table 5 below.) Other reasons included: want own home, present quarters in poor condition, and owner to reclaim unit. A number of the single veterans who wanted homes of their own were planning to be married shortly.

Table 5 - REASONS FOR PLANNING TO MOVE FOR WORLD WAR II VETERANS WHO PLAN TO MOVE WITHIN THE LOCALITY

REASON FOR PLANNING TO MOVE	Total	White	Negro

3 o 9 / 6

AVAILABILITY AND CHARACTERISTICS OF PRESENT HOUSING

In conjunction with the survey of veterans in the Macon locality to determine their present living arrangements and housing intentions, information on occupancy and vacancy in dwelling units was collected. The table below (table 6) summarizes the availability and characteristics of vacant dwelling units, and tenure and crowding in occupied units. The data in this table and in the remainder of the report relate to privately financed dwelling units only.

Unoccupied Privately Financed Dwelling Units

Of the privately financed dwelling units, 0.9 percent were unoccupied—0.7 percent were habitable and the remaining 0.2 percent were not habitable. (See table 6 below.) Habitable vacancies included those in good condition or in need of minor repairs and those in need of major repairs which were in no worse condition than similar occupied units in the same neighborhood. Of the habitable private vacancies, about three-tenths were offered for rent or sale, four-tenths had already been rented or sold, and the remaining three-tenths were being held off the rental or sale market for various reasons—awaiting demolition, undergoing extensive repairs, being held for settlement of estate, etc.

Separate analysis for Macon city alone showed that 0.7 percent of the private dwelling units in the city were unoccupied. This rate indicates a substantial decrease in the number of unoccupied dwelling units in this city since August 1942 when a similar survey showed a gross vacancy rate of 1.2 percent.

[1]Less than 0.05 percent.
[2]There were too few habitable vacancies in the sample to quote size and proportion having all facilities.

Practically all of the unoccupied private dwelling units had installed cooking facilities. Of the habitable vacancies, seven-tenths (71 percent) were single family dwelling units without business and virtually all of the remainder were units in 2-, 3-, or 4-family structures without business. (See table 7 below.)

Approximately one-half (50 percent) of the habitable vacancies were built before 1920; almost nine out of ten (88 percent) were vacant less than 1 month; and about one-eighth (12 percent) were located in converted structures. (A converted structure is one in which the number of dwelling units has changed since the structure was originally built.) One-third (33 percent) of the habitable vacancies lacked both private bath and private flush toilet and one-fourth (25 percent) lacked running water.

3 0 9 , 1 -

Occupied Privately Financed Dwelling Units

Extent of crowding

According to the results of the survey, 23.0 percent of the private dwelling units occupied by Negro families and 8.3 percent of the units occupied by white families were overcrowded, that is, contained more than one and one-half persons per room. (See table 6 on page 6.)

About 4 percent, or an estimated 800 private dwelling units, contained one or more subfamilies. (A subfamily is defined as a married couple living in the dwelling unit in addition to the head of the household.) Almost nine-tenths of these units had only one subfamily each and the remainder had two or more, making a total of almost 900 subfamilies in the area. Of the private units containing veterans, about 13 percent contained subfamilies.

In addition to the subfamilies, there were a considerable number of married women who did not report themselves as heads of households and whose husbands were living away from home. Of approximately 300 such women, about three-fourths had husbands in the armed forces and the remainder had husbands living away from home for other reasons, such as employment, "separation," protracted illness, and school.

Tenure, rent, and plans to move

About one-third (33.2 percent) of all the privately financed dwelling units in the area were occupied by their owners and almost two-thirds (65.9 percent) were occupied by tenants. (See table 6 on page 6.) The average (median) monthly contract rent for all tenant-occupied private units was $9. However, the average for units occupied by white tenants was $28 and the average for those occupied by Negroes was only $6.

Separate analysis for Macon city exclusive of the nearby built-up area (which amounted to only a small proportion of the total survey area) shows that 28.6 percent of the private dwelling units were occupied by their owners and 70.7 percent were occupied by tenants. These findings indicate a considerable shift from tenant-occupancy to owner-occupancy since April 1940 when a complete enumeration in the Census of Housing showed that 17.7 percent of all the dwelling units in Macon were owner-occupied and 80.0 percent were tenant-occupied. The 1940 data on tenure relate to all types of dwelling units including units in public housing projects, trailers, and tourist cabins which were excluded from the 1946 survey.

The recent survey further shows that less than 1 percent of the households in the area plan to move within 60 days and only one-third of these would definitely leave the locality. Almost all of the family groups planning to move were white families who rented their dwelling units.

STATEMENT ON THE SURVEY

What the survey covers

The findings presented in this report are based on a sample survey in Macon and built-up areas in Godfrey and Vineville districts. For dwelling unit occupancy and vacancy characteristics, approximately 3,700 privately financed dwelling units were enumerated in a sample carefully selected to represent all sections of the area and all types of residential structures except institutions, commercial rooming houses, transient hotels, trailers, and tourist cabins. For information on veterans' housing characteristics and intentions, the enumeration was extended to cover World War II veterans in hotels, commercial rooming houses, public housing projects, and trailer camps. Vacancy data for publicly financed housing for the Macon locality were obtained from reports from the National Housing Agency as of the end of March 1946.

Statistical reliability of the sample

Because the estimates in this report are based on data obtained from a sample of dwelling units, they may differ somewhat from the results which would have been obtained from a complete census of the area.

The following are examples of the magnitude of the sampling variations and the probability of their occurrence for three of the more important statistics quoted in this report. For the 0.9 percent gross vacancy rate for the privately financed dwelling units, the chances are two out of three that the rate which would have been obtained by a complete census is between 0.8 percent and 1.0 percent. For the 13 percent of the veterans who plan to buy or build in the locality, the chances are two out of three that it would have been between 12 percent and 14 percent; and for the 37 percent of the veterans who were living in shared units, the chances are two out of three that it would have been between 35 percent and 39 percent. Since the sampling variability of any percentage depends not only on the value of the percent but also on the size of the base on which the percentage is determined, the variations shown in the examples should not be applied indiscriminately to all percentages quoted in this report.

In addition to sampling variations, the estimates are subject to errors of response; but the possibility of such errors is not included in these measures of reliability since it is assumed that the results which would be obtained from a complete census with the use of the same schedules, instructions, and enumerators would be subject to the same type of error.

November 18, 1946

DEPARTMENT OF COMMERCE
Bureau of the Census

Population: HVet-No. 58

Survey of World War II Veterans and Dwelling Unit Vacancy and Occupancy in Baltimore, Md.

Approximately one-third of the married white World War II veterans and three-fifths of the married Negro veterans in Baltimore were doubling up with relatives or friends or were living in rented rooms, trailers, or tourist cabins according to the results of a sample survey released today by Director J.C.Capt, Bureau of the Census. The survey, made during September at the request of the National Housing Agency for the Veterans Emergency Housing Program, further showed that about one-tenth of the married white veterans and one-fourth of the married Negro veterans lived in dwelling units which needed major repairs or lacked one or more standard plumbing facilities--running water, private flush toilet, and private bath.

Of the estimated 90,000 World War II veterans living in Baltimore at the time of the survey, 70,000 were white and 20,000 were Negro. Slightly more than one-half of the white veterans were married and a little less than one-half were single, widowed, or divorced. Among the Negro veterans, the proportions were about the same as among the white veterans.

The survey also inquired into the housing plans of all the veterans for the next 12 months. When asked what they would do if housing would be available during the next year only at present prices and quality, 15 percent of the white veterans said they would be in the housing market--8 percent would buy or build a house and 7 percent would move and rent. Of the Negro veterans, 20 percent would be in the housing market--7 percent would buy or build and 13 percent would move and rent.

An additional 19 percent of the white veterans and 20 percent of the Negro veterans would be drawn into the housing market if they could find houses at the price, size, and quality they desire. Under such conditions, a total of 28 percent of the white veterans and 24 percent of the Negro veterans would buy or build a house within the next 12 months; and 6 percent of the white and 16 percent of the Negro veterans would move and rent.

VETERANS' HOUSING PLANS FOR THE NEXT 12 MONTHS

Of those who plan to buy or build in the present market, the white veterans indicated they are able to pay an average (median) price of $6,300 and Negro veterans reported they are able to pay $4,000.

Among the white veterans who would buy or build if houses are available at the price and quality they desire, the average (median) price they reported they would be able to pay for a house was $5,700 and the average (median) gross monthly payment they would be able to make was $51. Their average (median) weekly income from all sources was $51. The average size house they desired was six rooms. Negro veterans who would buy or build under these conditions reported an average price of $4,100, an average monthly payment of $40, and an average weekly income of $34. The average size house Negro veterans desired was six rooms.

Among the white veterans who would move and rent other quarters if they could get what they wanted, the average gross monthly rental they reported they would be able to pay was $44, their average weekly income was $39, and the average size unit they desired was four rooms. For Negro veterans who would move and rent, the average monthly rental reported was $36, their average weekly income was $32, and the average size unit they desired was four rooms.

35-382

GENERAL CHARACTERISTICS OF VETERANS

Of the estimated 90,000 veterans living in Baltimore at the time of the survey, about one-tenth (11 percent) were newcomers to the locality since they entered the service. The proportion of in-migrants for married white veterans was considerably higher than the proportion for single white veterans, while among Negro in-migrants the proportion was higher for single veterans. (See table 1 on page 5.)

Less than nine-tenths (87 percent) of the married white veterans and almost two-thirds (64 percent) of the single white veterans were employed. Of the Negro veterans, 78 percent of the married and 58 percent of the single were employed. Veterans in the "other than employed" group included those who did not desire work at the time of the survey as well as those who were seeking employment. Three-fifths of all the veterans who were not working had been discharged since December 31, 1945.

For all veterans, the average (median) weekly income from all sources was $39. Income for white veterans averaged $51 for the married as compared with $32 for the single. Among the Negro veterans there was less difference—$33 for the married and $28 for the single. Average income was based on all veterans including those who reported having no income.

PRESENT LIVING ARRANGEMENTS OF VETERANS

Hardship among veterans was partly reflected by the extent to which they were doubling up with relatives or friends or were living in rented rooms, trailers, or tourist cabins. Over one-fourth (28 percent) of the married white veterans and more than one-third (36 percent) of the married Negro veterans were doubling up in ordinary dwelling units, that is, were living in units which contained, in addition to the head of the household, one or more married couples or married women whose husbands were living elsewhere. Eighteen percent of the single white veterans as compared with seven percent of the married white veterans were living in rented rooms, trailers, or tourist cabins. For the Negro veterans, these proportions were 34 percent for the single and 21 percent for the married. (See table 2 on page 5.)

Exclusive of those living in rented rooms, one-tenth of the total white veterans and about one-fourth of the total Negro veterans lived in dwelling units which were in need of major repairs or lacked one or more standard plumbing facilities.

Eighteen percent of the married white and three percent of the married Negro veterans owned their homes. (See table 2 on page 5.) Approximately one-fourth of the married white and one-half of the married Negro owners purchased their homes after they were discharged. Over two-fifths (42 percent) of the married white veterans and less than one-half (46 percent) of the married Negro veterans were renting dwelling units in their names at the time of the survey and were paying an average (median) gross monthly rent of $38 and $30 respectively. About one-half of the white veterans and one-fifth of the Negro veterans who were renting acquired their units after they were discharged.

HOUSING PLANS OF VETERANS

More than nine-tenths (95 percent) of the total veterans plan to remain in the Baltimore locality for the coming year. Two percent of the veterans plan to leave the locality and three percent are undecided in their plans. (See table 3 on page 6.)

If housing is available during the year only at present prices and quality, 8 out of every 100 white veterans plan to buy or build in the locality, 7 plan to move and rent, 77 plan to remain in their present quarters, and the remaining 8 plan to move into rented rooms or double up, leave the area, or are undecided. Out of every 100 Negro veterans, 7 plan to buy or build, 13 plan to move and rent, 75 plan to remain in their present quarters, and the remaining 5 have other plans.

However, if the veterans could find what they want, 28 out of every 100 white veterans would buy or build a house, 6 would move and rent, and only 58 would remain in their present quarters during the coming year. If the Negro veterans could find what they want, 24 out of every 100 would buy or build a house, 16 would move and rent, and 55 would remain in their present quarters. (See table 5 on page 6.)

30-382

For the white veterans who would buy or build if they could find what they want, the average (median) price house they said they could afford was $5,700 and one-fourth of the veterans could pay only $4,700 or even less. Negro veterans desiring to buy or build reported they could afford to pay an average price of $4,100 with one-fourth able to pay only $3,300 or even less. (See table 4 on page 6.) Three-fifths of the white veterans preferred six-room houses and three-fifths of the Negro veterans preferred six-room houses. Two-thirds of the white veterans and almost two-fifths of the Negro veterans who would buy or build a house have taken some action toward buying or building or have saved money specifically for a house.

Practically all of the prospective home owners would purchase through monthly payments. The gross monthly payments they reported they would be able to make, including real estate taxes, fire insurance, heat, light, and cooking fuel, averaged $51 for white veterans and $40 for Negro veterans. One-fourth of the white veterans planning to buy or build reported they could pay only $44 or less and one-fourth of the Negro veterans could pay only $33 or less.

For the veterans who would move and rent if they could find what they want, the average (median) gross monthly rental they reported they would be able to pay, including payments for heat, light, and cooking fuel, was $44 for white and $36 for Negro veterans. Units in multifamily structures were preferred by one-half of the white and by two-thirds of the Negro veterans who would like to rent.

AVAILABILITY AND CHARACTERISTICS OF PRESENT HOUSING

In conjunction with the survey of veterans to determine their general characteristics, present living arrangements and housing plans, information on occupancy and vacancy in dwelling units was collected. Tables 6, 7, and 8 on the following pages summarize the availability and characteristics of vacant dwelling units and tenure, rent, facilities, and doubling up in occupied dwelling units.

The survey showed that 1.9 percent of all the dwelling units in Baltimore, including privately and publicly financed dwelling units, were unoccupied. The gross vacancy rate for privately financed dwelling units was also 1.9 percent. Among private units in white neighborhoods, the gross vacancy rate was 2.0 percent, and in Negro neighborhoods, 1.3 percent. A previous survey made by the Bureau of Labor Statistics in December 1945 showed gross vacancy rates of 1.2 percent in white sections and 1.1 percent in Negro sections of the city.

According to the recent survey, about four-fifths of the private vacancies were habitable; of these, one-fifth lacked installed cooking facilities. One-fourth of the habitable vacancies were being offered for rent or sale and the remainder were either already rented or sold or were being held off the rental or sale market for other reasons.

Three-fourths (74 percent) of the habitable vacancies were built before 1920, more than two-fifths (44 percent) were located in converted structures (structures in which the number of dwelling units has changed since the original construction), over three-tenths (32 percent) lacked one or more standard plumbing facilities, and the average size was four rooms.

About two-fifths of the habitable vacancies were rental units for which the average (median) monthly rental asked was $20 and the average size was three rooms. Over three-fifths (63 percent) of these units were located in converted structures.

The survey further showed that 22 percent of the privately financed dwelling units in which white veterans lived contained doubled-up families as compared with 8 percent for all private units occupied by white families. For Negroes, the proportions were 37 percent and 20 percent respectively. (See table 7 on page 7.) Practically all of the veteran-occupied units with doubled-up families contained one or more married couples in addition to the head of the household while very few contained only married women in addition to the head.

One-half (50.6 percent) of all the private dwelling units in Baltimore were occupied by their owners and less than one-half (47.5 percent) were occupied by tenants. The average (median) monthly contract rent was $36 for private units occupied by white tenants and $25 for those occupied by Negro tenants. (See tables 6 and 7 on page 7.) Among the tenant units containing one or more veterans, the average monthly rental was $35 for units occupied by white families and $28 for those occupied by Negroes. These units were rented by the heads of the households and not necessarily by the veterans themselves.

The proportions of owner-occupied and tenant-occupied dwelling units in September 1946 represent a substantial shift from tenant-occupancy to owner-occupancy since April 1940 when a complete enumeration in the Census of Housing showed that 39.3 percent of all the dwelling units in the area were occupied by their owners and 56.9 percent were occupied by tenants.

TECHNICAL NOTE

The findings presented in this report are based on a sample survey in Baltimore city. For dwelling unit occupancy and vacancy characteristics, approximately 6,100 dwelling units were enumerated to represent all sections of the city and all types of residential structures except institutions, publicly financed housing projects, transient hotels, commercial rooming houses, trailers, and tourist cabins. For information on veterans' housing characteristics and intentions, the enumeration was extended to include veterans in all types of residential structures except institutions and transient hotels. Occupancy and vacancy data for publicly financed housing for the Baltimore locality were obtained from reports of the National Housing Agency as of the end of August.

Because the percentages in this report are based on data obtained from a sample of dwelling units and veterans, they may vary somewhat from the results which would have been obtained from a complete census of the city. In general, the allowance to be made for sampling variation depends both on the numerical value of the percentage and the size of the base on which the percentage is determined, a percentage based on a larger number of dwelling units or veterans being less variable than one based on a smaller number. For example, in at least two out of three instances, almost all of the estimated percentages based on total veterans (column 1 of tables 1 through 5) may be expected to be not more than two percentage points larger or smaller than the percentages which would have been obtained if a complete census had been taken. Almost all of the percentages based on married veterans are subject to an allowance of plus or minus three percentage points while those based on single veterans are subject to an allowance of plus or minus four percentage points. Thus for the 27 percent of the total veterans who would like to buy or build a house it may be expected that the proportion which would have been obtained by a complete census would have been between 25 percent and 29 percent; for the 28 percent of the married white veterans who were living doubled up, the proportion would have been between 25 percent and 31 percent.

In addition to sampling variability, the estimates are subject to errors of response. Such errors may be expected to affect the sample estimates to about the same degree as they would affect the results of a complete census.

The number of World War II veterans shown in this report is an estimate of the number of veterans in the locality exclusive of those in institutions and hotels. This figure was based on the weighted sample results and on an independent estimate derived from the distribution of veterans by state of preservice residence and the proportion of 1-C Selective Service registrants in the locality. This estimate is only a rough approximation but is the best that can be made from the limited information available.

The number of privately financed dwelling units in the city is an estimate based on the weighted sample results and the 1940 census data plus building permit records.

November 29, 1946 DEPARTMENT OF COMMERCE
Bureau of the Census Population: HVet-No. 63

Survey of World War II Veterans and Dwelling Unit Vacancy and Occupancy in Charlotte, N. C.

Approximately two out of five married white World War II veterans and two out of five married Negro veterans in Charlotte were doubling up with relatives or friends or were living in rented rooms, trailers, or tourist cabins according to the results of a sample survey released today by Director J.C. Capt, Bureau of the Census. The survey, made during the latter part of August at the request of the National Housing Agency for the Veterans Emergency Housing Program, further showed that eight percent of the married white veterans and 45 percent of the married Negro veterans lived in dwelling units which needed major repairs or lacked one or more standard plumbing facilities—running water, private flush toilet, and private bath.

Of the estimated 10,000 World War II veterans living in Charlotte at the time of the survey, 8,200 were white and 1,800 were Negro. About three-fifths of the white veterans were married and two-fifths were single, widowed, or divorced. Among the Negro veterans, one-half were married.

The survey also inquired into the housing plans of all the veterans for the next 12 months. When asked what they would do if housing would be available during the next year only at present prices and quality, 21 percent of the white veterans said they would be in the housing market—14 percent would buy or build a house and 7 percent would move and rent. Of the Negro veterans, 25 percent would be in the housing market—19 percent would buy or build and 6 percent would move and rent.

An additional 16 percent of the white veterans and 7 percent of the Negro veterans would be drawn into the housing market if they could find houses at the price, size, and quality they desire. Under such conditions, a total of 31 percent of the white veterans and 23 percent of the Negro veterans would buy or build a house within the next 12 months; and 6 percent of the white and 9 percent of the Negro veterans would move and rent.

VETERANS' HOUSING PLANS FOR THE NEXT 12 MONTHS

Of those who plan to buy or build in the present market, the white veterans indicated they are able to pay an average (median) price of $6,700 and one-half the Negro veterans reported they are able to pay $3,000 or less.

Among the white veterans who would buy or build if houses are available at the price and quality they desire, the average (median) price they reported they would be able to pay for a house was $6,800 and the average (median) gross monthly payment they would be able to make, including payments for real estate taxes, fire insurance, heat, light, and cooking fuel, was $51. Their average (median) weekly income from all sources was $55. The average size house they desired was six rooms. Negro veterans who would buy or build under these conditions reported an average price of $3,900, an average monthly payment of $33, and an average weekly income of $29. The average size house Negro veterans desired was five rooms.

Among all of the veterans who would move and rent other quarters if they could get what they wanted, the average gross monthly rental they reported they would be able to pay was $37, their average weekly income was $44, and the average size unit they desired was four rooms.

35727

GENERAL CHARACTERISTICS OF VETERANS

Of the estimated 10,000 veterans living in Charlotte at the time of the survey, almost one-fifth (18 percent) were newcomers to the locality since they entered the service. The proportion of in-migrants for married veterans was considerably higher than the proportion for single veterans. (See table 1 on page 5.)

More than nine-tenths (94 percent) of the married white veterans and two-thirds (66 percent) of the single white veterans were employed. Of the Negro veterans, 80 percent of the married and 62 percent of the single were employed. Veterans in the "other than employed" group included those who did not desire work at the time of the survey as well as those who were seeking employment. Three-fifths of all the veterans who were not working had been discharged since December 31, 1945.

For all veterans, the average (median) weekly income from all sources was $40. Income for white veterans averaged $53 for the married as compared with $30 for the single. Among the Negro veterans, there was less difference--$30 for the married and $26 for the single. Average income was based on all veterans including those who reported having no income.

PRESENT LIVING ARRANGEMENTS OF VETERANS

Hardship among veterans was partly reflected by the extent to which they were doubling up with relatives or friends or were living in rented rooms, trailers, or tourist cabins. One-third (33 percent) of the married white veterans and one-third (32 percent) of the married Negro veterans were doubling up in ordinary dwelling units, that is, were living in units which contained, in addition to the head of the household, one or more married couples or married women whose husbands were living elsewhere. Fifteen percent of the single white veterans as compared with five percent of the married white veterans were living in rented rooms, trailers, or tourist cabins. For the Negro veterans, these proportions were 16 percent for the single and 8 percent for the married. (See table 2 on page 5.)

Exclusive of those living in rented rooms, less than one-tenth of the total white veterans and over four-tenths of the total Negro veterans lived in dwelling units which were in need of major repairs or lacked one or more standard plumbing facilities.

One-fifth (19 percent) of the married white and six percent of the married Negro veterans owned their homes. (See table 2 on page 5.) Two-fifths of the white and one-twelfth of the Negro owners purchased their homes after they were discharged. Almost two-fifths (38 percent) of the married white veterans and one-half (49 percent) of the married Negro veterans were renting dwelling units in their names at the time of the survey and were paying an average (median) gross monthly rent of $42 and $18, respectively. About one-half of the white veterans and one-third of the Negro veterans who were renting acquired their units after they were discharged.

HOUSING PLANS OF VETERANS

More than nine-tenths (93 percent) of the total veterans plan to remain in the Charlotte locality for the coming year. Four percent of the veterans plan to leave the locality and three percent are undecided in their plans. (See table 3 on page 6.)

If housing is available during the year only at present prices and quality, 14 out of every 100 white veterans plan to buy or build in the locality, 7 plan to move and rent, 71 plan to remain in their present quarters, and the remaining 8 plan to move into rented rooms or double up, leave the area, or are undecided. Out of every 100 Negro veterans, 19 plan to buy or build, 6 plan to move and rent, 65 plan to remain in their present quarters, and the remaining 10 have other plans.

However, if the veterans could find what they want, 31 out of every 100 white veterans would buy or build a house, 6 would move and rent, and only 55 would remain in their present quarters during the coming year. (See table 5 on page 6.) If the Negro veterans could find what they want, 23 out of every 100 would buy or build a house, 9 would move and rent, and 58 would remain in their present quarters.

For the white veterans who would buy or build if they could find what they want, the average (median) price house they said they could afford was $6,800 and one-fourth of the veterans could pay only $5,700 or even less. Negro veterans desiring to buy or build reported they could afford to pay an average price of $3,900 with one-fourth able to pay only $3,000 or even less. (See table 4 on page 6.) About four-fifths of the white veterans preferred five- or

six-room houses and the same proportion of the Negro veterans preferred four- or five-room houses. Seven-tenths of the white veterans and slightly more than one-half of the Negro veterans who would buy or build a house have taken some action toward buying or building or have saved money specifically for a house.

Practically all of the prospective home owners would purchase through monthly payments. The gross monthly payments they reported they would be able to make, including real estate taxes, fire insurance, heat, light, and cooking fuel, averaged $51 for white veterans and $33 for Negro veterans. One-fourth of the white veterans planning to buy or build reported they could pay only $41 or less and one-fourth of the Negro veterans could pay only $25 or less.

For the white veterans who would move and rent if they could find what they want, the average (median) gross monthly rental they reported they would be able to pay, including payments for heat, light, and cooking fuel, was $43. One-fourth of the veterans could afford only $34 or less. Of the Negro veterans who would move and rent if they could find what they want, three-fourths reported they are able to pay $20 or less monthly. Units in single-family structures were preferred by three-fourths of all the veterans who would like to rent.

AVAILABILITY AND CHARACTERISTICS OF PRESENT HOUSING

In conjunction with the survey of veterans to determine their general characteristics, present living arrangements and housing plans, information on occupancy and vacancy in dwelling units was collected. Tables 6 and 7 on the following pages summarize the availability and characteristics of vacant dwelling units and tenure, rent, facilities, and doubling-up in occupied dwelling units.

The survey showed that 0.5 percent of all the dwelling units in Charlotte, including privately and publicly financed dwelling units, were unoccupied. The gross vacancy rate for privately financed dwelling units alone was the same, 0.5 percent. Among private units in white neighborhoods, the gross vacancy rate was 0.6 percent and among those in Negro neighborhoods, 0.3 percent. These rates indicate a decrease in the number of unoccupied private units in Charlotte since July 1944, when a similar survey showed gross vacancy rates of 0.9 percent in white and 0.8 percent in Negro sections.

According to the recent survey four-fifths of the private vacancies were habitable. About one-fourth of the habitable vacancies were being offered for rent or sale and the remainder were either already rented or sold or were being held off the rental or sale market for other reasons.

The survey further showed that 27 percent of the privately financed dwelling units in which white veterans lived contained doubled-up families as compared with 13 percent for all private units occupied by white families. For Negroes the proportions were 25 percent and 9 percent respectively. (See table 7 on page 7.) Practically all of the veteran-occupied units with doubled-up families contained one or more married couples in addition to the head of the household while very few contained only married women in addition to the head.

About two-fifths (39.0 percent) of all the private dwelling units in Charlotte were occupied by their owners and three-fifths (60.5 percent) were occupied by tenants. The average (median) monthly contract rent was $34 for private units occupied by white tenants and $13 for those occupied by Negro tenants. (See tables 6 and 7 on page 7.) Among the tenant units containing one or more veterans, the average monthly rental was $32 for units occupied by white families and $14 for those occupied by Negroes. These units were rented by the heads of the households and not necessarily by the veterans themselves.

The proportions of owner-occupied and tenant-occupied dwelling units in August 1946 represent a considerable shift from tenant-occupancy to owner-occupancy since April 1940 when a complete enumeration in the Census of Housing showed that 27.0 percent of all the dwelling units in the area were occupied by their owners and 71.3 percent were occupied by tenants.

TECHNICAL NOTE

The findings presented in this report are based on a sample survey in the city of Charlotte. For dwelling unit occupancy and vacancy characteristics, approximately 5,300 dwelling units were enumerated to represent all sections of the city and all types of residential structures except institutions, publicly financed housing projects, transient hotels, commercial

35727

rooming houses, trailers, and tourist cabins. For information on veterans' housing characteristics and intentions, the enumeration was extended to include veterans in all types of residential structures except institutions and transient hotels. Occupancy and vacancy data for publicly financed housing for the Charlotte locality were obtained from reports of the National Housing Agency as of the end of August.

Because the percentages in this report are based on data obtained from a sample of dwelling units and veterans, they may vary somewhat from the results which would have been obtained from a complete census of the city. The following are examples of the magnitude of the sampling variations and the probability of their occurrence for three of the more significant statistics quoted in this report. For the 29 percent of the total veterans who would like to buy or build a house, the chances are two out of three that the rate which would have been obtained by a complete census is between 27 percent and 31 percent. For the 33 percent of the married white veterans who were living doubled-up, the chances are two out of three that the rate which would have been obtained by a complete census is between 30 percent and 36 percent; and for the 32 percent of the married Negro veterans who were living doubled-up, the chances are two out of three that the rate would have been between 27 percent and 37 percent. Since the sampling variability of any percentage depends not only on the value of the percent, but also on the size of the base on which the percentage is determined, the variations shown in the examples should not be applied indiscriminately to all percentages quoted in this report.

In addition to sampling variability, the estimates are subject to errors of response. Such errors may be expected to affect the sample estimates to about the same degree as they would affect the results of a complete census.

The number of World War II veterans shown in this report is an estimate of the number of veterans in the locality exclusive of those in institutions and hotels. This figure was based on the weighted sample results and on an independent estimate derived from the distribution of veterans by state of preservice residence and the proportion of 1-C Selective Service registrants in the locality. This estimate is only a rough approximation but is the best that can be made from the limited information available.

The number of privately financed dwelling units in the city is an estimate based on the weighted sample results and the 1940 census data plus building permit records.

One-fourth of the units rented for more than	$37	$44	$17
Average (median) monthly contract rent for veteran-occupied tenant units	$27	$32	$14
One-fourth of the units rented for less than	$16	$22	$11
One-fourth of the units rented for more than	$39	$43	$20

[1] Proportions for characteristics of veteran-occupied dwelling units are not comparable with those for veterans shown in table 2. The figures in table 2 are based on veterans and those in table 7 are based on dwelling units containing veterans.

35727

November 29, 1946 DEPARTMENT OF COMMERCE
Bureau of the Census Population: HVet-No. 84

Survey of World War II Veterans and Dwelling Unit Vacancy and Occupancy in the Beaumont-Port Arthur Area, Texas

Approximately three-tenths of the married white World War II veterans and four-tenths of the married Negro veterans in the Beaumont-Port Arthur area were doubling up with relatives or friends or were living in rented rooms, trailers, or tourist cabins according to the results of a sample survey released today by Director J. C. Capt, Bureau of the Census. The survey, made during July at the request of the National Housing Agency for the Veterans Emergency Housing Program, further showed that one-seventh of the married white veterans and three-fifths of the married Negro veterans lived in dwelling units which needed major repairs or lacked one or more standard plumbing facilities--running water, private flush toilet, and private bath.

Of the estimated 10,000 World War II veterans living in the Beaumont-Port Arthur area at the time of the survey, 8,200 were white and 1,800 were Negro. Three-fifths of the white veterans were married and two-fifths were single, widowed, or divorced. Among the Negro veterans, more than one-half were married.

The survey also inquired into the housing plans of all the veterans for the next 12 months. When asked what they would do if housing would be available during the next year only at present prices and quality, 16 percent of the white veterans said they would be in the housing market—10 percent would buy or build a house and 6 percent would move and rent. Of the Negro veterans, 15 percent would be in the housing market—12 percent would buy or build and 3 percent would move and rent.

An additional 22 percent of the white veterans and 19 percent of the Negro veterans would be drawn into the housing market if they could find houses at the price, size, and quality they desire. Under such conditions, a total of 33 percent of the white veterans and 31 percent of the Negro veterans would buy or build a house within the next 12 months; and 5 percent of the white and 3 percent of the Negro veterans would move and rent.

VETERANS' HOUSING PLANS FOR THE NEXT 12 MONTHS

Of those who plan to buy or build in the present market, the white veterans indicated they are able to pay an average (median) price of $5,600 and Negro veterans reported they are able to pay $3,500.

Among the white veterans who would buy or build if houses are available at the price and quality they desire, the average (median) price they reported they would be able to pay for a house was $5,200 and the average (median) gross monthly payment they would be able to make, including real estate taxes, fire insurance, heat, light, and cooking fuel, was $45. Their average (median) weekly income from all sources was $53. The average size house they desired was five rooms. Negro veterans who would buy or build under these conditions reported an average price of $3,200, an average monthly payment of $33, and an average weekly income of $29. The average size house Negro veterans desired was five rooms.

Among all of the veterans who would move and rent other quarters if they could get what they wanted, the average gross monthly rental they reported they would be able to pay was $37, their average weekly income was $38, and the average size unit they desired was four rooms.

35028

GENERAL CHARACTERISTICS OF VETERANS

Of the estimated 10,000 veterans living in the Beaumont-Port Arthur area at the time of the survey, nearly one-fourth (23 percent) were newcomers to the locality since they entered the service. The proportion of in-migrants for married veterans was higher than the proportion for single veterans. (See table 1 on page 5.)

Almost nine-tenths (88 percent) of the married white veterans and six-tenths (61 percent) of the single white veterans were employed. Of the Negro veterans, 76 percent of the married and 56 percent of the single were employed. Veterans in the "other than employed" group included those who did not desire work at the time of the survey as well as those who were seeking employment. One-half of all the veterans who were not working had been discharged since December 31, 1945.

For all veterans, the average (median) weekly income from all sources was $43. Income for white veterans averaged $53 for the married as compared with $32 for the single. Among the Negro veterans there was less difference—$30 for the married and $25 for the single. Average income was based on all veterans including those who reported having no income.

PRESENT LIVING ARRANGEMENTS OF VETERANS

Hardship among veterans was partly reflected by the extent to which they were doubling up with relatives or friends or were living in rented rooms, trailers, or tourist cabins. Over two-tenths (22 percent) of the married white veterans and three-tenths (31 percent) of the married Negro veterans were doubling up in ordinary dwelling units, that is, were living in units which contained, in addition to the head of the household, one or more married couples or married women whose husbands were living elsewhere. Thirty-three percent of the single white veterans as compared with nine percent of the married white veterans were living in rented rooms, trailers, or tourist cabins. For the Negro veterans, these proportions were 29 percent for the single and 11 percent for the married. (See table 2 on page 5.)

Exclusive of those living in rented rooms, about one-eighth of the total white veterans and nearly three-fifths of the total Negro veterans lived in dwelling units which were in need of major repairs or lacked one or more standard plumbing facilities.

One-fifth (19 percent) of the married white and one-eighth (12 percent) of the married Negro veterans owned their homes. (See table 2 on page 5.) About one-half of the married white and one-fourth of the married Negro owners purchased their homes after they were discharged. More than one-half (55 percent) of the married white veterans and over two-fifths (43 percent) of the married Negro veterans were renting dwelling units in their names at the time of the survey and were paying an average (median) gross monthly rent of $37 and $16 respectively. Four-fifths of the married white veterans and three-fifths of the married Negro veterans who were renting acquired their units after they were discharged.

HOUSING PLANS OF VETERANS

More than four-fifths (85 percent) of the total veterans plan to remain in the Beaumont-Port Arthur locality for the coming year. Eight percent of the veterans plan to leave the locality and seven percent are undecided in their plans. (See table 3 on page 6.)

If housing is available during the year only at present prices and quality, 10 out of every 100 white veterans plan to buy or build in the locality, 6 plan to move and rent, 68 plan to remain in their present quarters, and the remaining 16 plan to move into rented rooms or double up, leave the area, or are undecided. Out of every 100 Negro veterans, 12 plan to buy or build, 3 plan to move and rent, 66 plan to remain in their present quarters, and the remaining 19 have other plans.

However, if the veterans could find what they want, 33 out of every 100 white veterans would buy or build a house, 5 would move and rent, and only 46 would remain in their present quarters during the coming year. (See table 5 on page 6.) If the Negro veterans could find what they want, 31 out of every 100 would buy or build a house, 3 would move and rent, and 48 would remain in their present quarters.

35628

For the white veterans who would buy or build if they could find what they want, the average (median) price house they said they could afford was $5,200 and one-fourth of the veterans could pay only $4,100 or even less. Negro veterans desiring to buy or build reported they could afford to pay an average price of $3,200. (See table 4 on page 6.) Almost nine-tenths of the white veterans preferred five- or six-room houses and nine-tenths of the Negro veterans preferred four- or five-room houses. About two-thirds of the white veterans and slightly more than two-fifths of the Negro veterans who would buy or build a house have taken some action toward buying or building or have saved money specifically for a house.

Practically all of the prospective home owners would purchase through monthly payments. The gross monthly payments they reported they would be able to make, including real estate taxes, fire insurance, heat, light, and cooking fuel, averaged $45 for white veterans and $33 for Negro veterans. One-fourth of the white veterans planning to buy or build reported they could pay only $37 or less and one-fourth of the Negro veterans could pay only $26 or less.

For the white veterans who would move and rent if they could find what they want, the average (median) gross monthly rental they reported they would be able to pay, including payments for heat, light, and cooking fuel, was $37. One-fourth of the veterans could afford only $33 or less. Units in single-family structures were preferred by nine-tenths of all the white veterans who would like to rent. (There were too few Negro veterans in the sample who plan to move and rent other quarters to quote average monthly rent and size of unit.)

AVAILABILITY AND CHARACTERISTICS OF PRESENT HOUSING

In conjunction with the survey of veterans to determine their general characteristics, present living arrangements and housing plans, information on occupancy and vacancy in dwelling units was collected. Tables 6, 7, and 8 on the following pages summarize the availability and characteristics of vacant dwelling units and tenure, rent, facilities, and doubling-up in occupied dwelling units.

The survey showed that 1.3 percent of all the dwelling units in the Beaumont-Port Arthur area, including privately and publicly financed dwelling units, were unoccupied. The gross vacancy rate for privately financed dwelling units alone was the same, 1.3 percent, in both white and Negro neighborhoods. However, the habitable vacancy rate was higher in white than in Negro sections—1.2 percent and 0.6 percent respectively. (See table 6 on page 7.)

Approximately three-fourths of the private vacancies were habitable; of these, about three-tenths lacked installed cooking facilities. One-half of the habitable vacancies were being offered for rent or sale and the remainder were either already rented or sold or were being held off the rental or sale market for other reasons.

One-half (51 percent) of the habitable vacancies were built before 1930, more than one-half (54 percent) had been vacant one month or longer, one-third (33 percent) lacked one or more standard plumbing facilities, and the average size was four rooms.

About two-fifths of the habitable vacancies were rental units for which the average (median) monthly rental asked was $28 and the average size was two rooms. Almost two-thirds (65 percent) of the rental vacancies lacked one or more standard plumbing facilities.

The survey further showed that 22 percent of the privately financed dwelling units in which white veterans lived contained doubled-up families as compared with 8 percent for all private units occupied by white families. For Negroes the proportions were 27 percent and 11 percent respectively. (See table 7 on page 7.) Practically all of the veteran-occupied units with doubled-up families contained one or more married couples in addition to the head of the household while very few contained only married women in addition to the head.

More than one-half (54.4 percent) of all the private dwelling units in the Beaumont-Port Arthur area were occupied by their owners and less than one-half (44.3 percent) were occupied by tenants. The average (median) monthly contract rent was $33 for private units occupied by white tenants and $13 for those occupied by Negro tenants. (See tables 6 and 7 on page 7.) Among the tenant units containing one or more veterans, the average monthly rental was $35 for units occupied by white families and $14 for those occupied by Negroes. These units were rented by the heads of the households and not necessarily by the veterans themselves.

35628

The proportions of owner-occupied and tenant-occupied dwelling units in July 1946 represent a substantial shift from tenant-occupancy to owner-occupancy since April 1940 when a complete enumeration in the Census of Housing showed that 37.1 percent of all the dwelling units in the area were occupied by their owners and 58.4 percent were occupied by tenants. (The 1940 tenure figures do not include those for Lakeview town; however this town represents only a small portion of the survey area.)

TECHNICAL NOTE

The findings presented in this report are based on a sample survey in Beaumont city, Port Arthur city, Griffing Park town, Lakeview town, Pear Ridge town, and Port Neches city. For dwelling unit occupancy and vacancy characteristics, approximately 6,000 dwelling units were enumerated to represent all sections of the area and all types of residential structures except institutions, publicly financed housing projects, transient hotels, commercial rooming houses, trailers, and tourist cabins. For information on veterans' housing characteristics and intentions, the enumeration was extended to include veterans in all types of residential structures except institutions and transient hotels. Occupancy and vacancy data for publicly financed housing for the Beaumont-Port Arthur locality were obtained from reports of the National Housing Agency as of the end of June.

Because the percentages in this report are based on data obtained from a sample of dwelling units and veterans, they may vary somewhat from the results which would have been obtained from a complete census of the area. The following are examples of the magnitude of the sampling variations and the probability of their occurrence for three of the more significant statistics quoted in this report. For the 32 percent of the total veterans who would like to buy or build a house, the chances are two out of three that the rate which would have been obtained by a complete census is between 30 percent and 34 percent. For the 22 percent of the married white veterans who were living doubled-up, the chances are two out of three that the rate which would have been obtained by a complete census is between 20 percent and 24 percent; and for the 31 percent of the married Negro veterans who were living doubled-up, the chances are two out of three that the rate would have been between 26 percent and 36 percent. Since the sampling variability of any percentage depends not only on the value of the percent, but also on the size of the base on which the percentage is determined, the variations shown in the examples should not be applied indiscriminately to all percentages quoted in this report.

In addition to sampling variability, the estimates are subject to errors of response. Such errors may be expected to affect the sample estimates to about the same degree as they would affect the results of a complete census.

The number of World War II veterans shown in this report is an estimate of the number of veterans in the locality exclusive of those in institutions and hotels. This figure was based on the weighted sample results and on an independent estimate derived from the distribution of veterans by state of preservice residence and the proportion of 1-C Selective Service registrants in the locality. This estimate is only a rough approximation but is the best that can be made from the limited information available.

The number of privately financed dwelling units in the area is an estimate based on the weighted sample results and the 1940 census data plus building permit records.

Average (median) monthly gross rent for units rented by veteran	$35	$37	([3])	$16	([3])
One-fourth of the units rented for less than	$27	$29	([3])	([3])	([3])
One-fourth of the units rented for more than	$45	$47	([3])	([3])	([3])

[1] For purposes of this survey, a veteran was considered as living doubled-up if he lived in a dwelling unit which contained more than one family, that is, the unit contained, in addition to the head of the household, married couples or married women with husbands absent.

[2] Standard plumbing facilities included running water in the unit, private flush toilet in the structure, and private installed bathtub or shower in the structure.

[3] There were too few veterans in the sample who rented their dwelling units to quote average monthly rental.

November 29, 1946

DEPARTMENT OF COMMERCE
Bureau of the Census

Population: HVet-No. 65

Survey of World War II Veterans and Dwelling Unit Vacancy and Occupancy in Greensboro, N. C.

Approximately one-half of the married white World War II veterans and two-thirds of the married Negro veterans in Greensboro were doubling up with relatives or friends or were living in rented rooms, trailers, or tourist cabins according to the results of a sample survey released today by Director J.C.Capt, Bureau of the Census. The survey, made during early August at the request of the National Housing Agency for the Veterans Emergency Housing Program, further showed that one-sixth of the married white veterans and three-tenths of the married Negro veterans lived in dwelling units which needed major repairs or lacked one or more standard plumbing facilities—running water, private flush toilet, and private bath.

Of the estimated 6,000 World War II veterans living in Greensboro at the time of the survey, 5,000 were white and 1,000 were Negro. About three-fifths of the white veterans were married and two-fifths were single, widowed, or divorced. Among the Negro veterans, approximately two-fifths were married.

The survey also inquired into the housing plans of all the veterans for the next 12 months. When asked what they would do if housing would be available during the next year only at present prices and quality, 27 percent of the white veterans said they would be in the housing market--22 percent would buy or build a house and 5 percent would move and rent. Of the Negro veterans, 34 percent would be in the housing market--28 percent would buy or build and 6 percent would move and rent.

An additional 13 percent of the white veterans and 10 percent of the Negro veterans would be drawn into the housing market if they could find houses at the price, size, and quality they desire. Under such conditions, a total of 36 percent of the white veterans and 37 percent of the Negro veterans would buy or build a house within the next 12 months; and 4 percent of the white and 7 percent of the Negro veterans would move and rent.

VETERANS' HOUSING PLANS FOR THE NEXT 12 MONTHS

Of those who plan to buy or build in the present market, the white veterans indicated they are able to pay an average (median) price of $6,500 and Negro veterans reported they are able to pay $4,300.

Among the white veterans who would buy or build if houses are available at the price and quality they desire, the average (median) price they reported they would be able to pay for a house was $6,200 and the average (median) gross monthly payment they would be able to make, including real estate taxes, fire insurance, heat, light, and cooking fuel, was $45. Their average (median) weekly income from all sources was $49. The average size house they desired was six rooms. Negro veterans who would buy or build under these conditions reported an average price of $4,100, an average monthly payment of $28, and an average weekly income of $31. The average size house Negro veterans desired was five rooms.

Among all of the veterans who would move and rent other quarters if they could get what they wanted, the average gross monthly rental they reported they would be able to pay was $40, their average weekly income was $44, and the average size unit they desired was four rooms.

35729

GENERAL CHARACTERISTICS OF VETERANS

Of the estimated 6,000 veterans living in Greensboro at the time of the survey, about one-fifth (18 percent) were newcomers to the locality since they entered the service. The proportions of in-migrants for married veterans were considerably higher than the proportions for single veterans. (See table 1 on page 5.)

Over nine-tenths (94 percent) of the married white veterans and two-thirds (67 percent) of the single white veterans were employed. Of the Negro veterans, 84 percent of the married and 66 percent of the single were employed. Veterans in the "other than employed" group included those who did not desire work at the time of the survey as well as those who were seeking employment. Three-fifths of all the veterans who were not working had been discharged since December 31, 1945.

For all veterans, the average (median) weekly income from all sources was $40. Income for white veterans averaged $50 for the married as compared with $31 for the single. Among the Negro veterans, there was less difference--$31 for the married and $28 for the single. Average income was based on all veterans including those who reported having no income.

PRESENT LIVING ARRANGEMENTS OF VETERANS

Hardship among veterans was partly reflected by the extent to which they were doubling up with relatives or friends or were living in rented rooms, trailers, or tourist cabins. Over three-tenths (32 percent) of the married white veterans and three-tenths (30 percent) of the married Negro veterans were doubling up in ordinary dwelling units, that is, were living in units which contained, in addition to the head of the household, one or more married couples or married women whose husbands were living elsewhere. Twenty-four percent of the single white veterans as compared with 23 percent of the married white veterans were living in rented rooms, trailers, or tourist cabins. For the Negro veterans, these proportions were 26 percent for the single and 36 percent for the married. (See table 2 on page 5.)

Exclusive of those living in rented rooms, about one-sixth of the total white veterans and two-sixths of the total Negro veterans lived in dwelling units which were in need of major repairs or lacked one or more standard plumbing facilities.

Twenty percent of the married white and six percent of the married Negro veterans owned their homes. (See table 2 on page 5.) Not quite one-half of all the owners purchased their homes after they were discharged. About three-tenths (31 percent) of the married white veterans and almost three-tenths (28 percent) of the married Negro veterans were renting dwelling units in their names at the time of the survey and were paying an average (median) gross monthly rent of $36 and $20 respectively. Five-eighths of the white veterans and three-eighths of the Negro veterans who were renting acquired their units after they were discharged.

HOUSING PLANS OF VETERANS

Over nine-tenths (93 percent) of the total veterans plan to remain in the Greensboro locality for the coming year. Five percent of the veterans plan to leave the locality and two percent are undecided in their plans. (See table 3 on page 6.)

If housing is available during the year only at present prices and quality, 22 out of every 100 white veterans plan to buy or build in the locality, 5 plan to move and rent, 66 plan to remain in their present quarters, and the remaining 7 plan to move into rented rooms or double up, leave the area, or are undecided. Out of every 100 Negro veterans, 28 plan to buy or build, 6 plan to move and rent, 54 plan to remain in their present quarters, and the remaining 12 have other plans.

However, if the veterans could find what they want, 36 out of every 100 white veterans would buy or build a house, 4 would move and rent, and only 53 would remain in their present quarters during the coming year. If the Negro veterans could find what they want, 37 out of every 100 would buy or build a house, 7 would move and rent, and 44 would remain in their present quarters. (See table 5 on page 6.)

35729

For the white veterans who would buy or build if they could find what they want, the average (median) price house they said they could afford was $6,200 and one-fourth of the veterans could pay only $5,000 or even less. Negro veterans desiring to buy or build reported they could afford to pay an average price of $4,100 with one-fourth able to pay only $3,300 or even less. (See table 4 on page 6.) About four-fifths of the white veterans and four-fifths of the Negro veterans preferred five- or six-room houses. Approximately three-fifths of the white veterans and two-fifths of the Negro veterans who would buy or build a house have taken some action toward buying or building or have saved money specifically for a house.

Practically all of the prospective home owners would purchase through monthly payments. The gross monthly payments they reported they would be able to make, including real estate taxes, fire insurance, heat, light, and cooking fuel, averaged $45 for white veterans and $28 for Negro veterans. One-fourth of the white veterans planning to buy or build reported they could pay only $37 or less and one-fourth of the Negro veterans could pay only $23 or less.

For the white veterans who would move and rent if they could find what they want, the average (median) gross monthly rental they reported they would be able to pay, including payments for heat, light, and cooking fuel, was $45. One-fourth of these veterans could afford only $36 or less. Units in single-family structures were preferred by about three-fifths of the white veterans who would like to rent. (There were too few Negro veterans in the sample who plan to move and rent other quarters to quote average monthly rent and type of unit.)

AVAILABILITY AND CHARACTERISTICS OF PRESENT HOUSING

In conjunction with the survey of veterans to determine their general characteristics, present living arrangements and housing plans, information on occupancy and vacancy in dwelling units was collected. Tables 6, 7, and 8 on the following pages summarize the availability and characteristics of vacant dwelling units and tenure, rent, facilities, and doubling-up in occupied dwelling units.

The survey showed that 1.0 percent of all the dwelling units in the city were unoccupied. The gross vacancy rate among units intended for white occupancy was the same as among units intended for Negro occupancy, 1.0 percent.

Nine-tenths of all the vacancies were habitable; of these, one-sixth lacked installed cooking facilities. One-third of the habitable vacancies were being offered for rent or sale and the remainder were either already rented or sold or were being held off the rental or sale market for other reasons.

Almost three-fifths (57 percent) of the habitable vacancies were built before 1930, one-fourth (26 percent) had been vacant for one month or longer, more than five-sixths (85 percent) were units in single-family structures without business, and the average size was five rooms.

Over two-fifths of the habitable vacancies were rental units with an average size of three rooms. One in five of the habitable rental vacancies lacked one or more of the standard plumbing facilities.

The survey further showed that 33 percent of the dwelling units in which white veterans lived contained doubled-up families as compared with 16 percent for all units occupied by white families. For Negroes the proportions were 36 percent and 17 percent respectively. (See table 7 on page 7.) Practically all of the veteran-occupied units with doubled-up families contained one or more married couples in addition to the head of the household while very few contained only married women in addition to the head.

Less than one-half (45.9 percent) of all the dwelling units in Greensboro were occupied by their owners and more than one-half (53.1 percent) were occupied by tenants. The average (median) monthly contract rent was $29 for units occupied by white tenants and $16 for those occupied by Negro tenants. (See tables 6 and 7 on page 7.) Among the tenant units containing one or more veterans, the average monthly rental was $26 for units occupied by white families and $18 for those occupied by Negroes. These units were rented by the heads of the households and not necessarily by the veterans themselves.

The proportions of owner-occupied and tenant-occupied dwelling units in August 1946 represent a considerable shift from tenant-occupancy to owner-occupancy since April 1940 when a complete enumeration in the Census of Housing showed that 29.6 percent of all the dwelling units in Greensboro were occupied by their owners and 67.8 percent were occupied by tenants.

TECHNICAL NOTE

The findings presented in this report are based on a sample survey in the city of Greensboro. For dwelling unit occupancy and vacancy characteristics, approximately 5,000 dwelling units were enumerated to represent all sections of the city and all types of residential structures except institutions, publicly financed housing projects, transient hotels, commercial rooming houses, trailers, and tourist cabins. For information on veterans' housing characteristics and intentions, the enumeration was extended to include veterans in all types of residential structures except institutions and transient hotels.

Because the percentages in this report are based on data obtained from a sample of dwelling units and veterans, they may vary somewhat from the results which would have been obtained from a complete census of the city. The following are examples of the magnitude of the sampling variations and the probability of their occurrence for three of the more significant statistics quoted in this report. For the 36 percent of the total veterans who would like to buy or build a house, the chances are two out of three that the rate which would have been obtained by a complete census is between 34 percent and 38 percent. For the 32 percent of the married white veterans who were living doubled-up, the chances are two out of three that the rate which would have been obtained by a complete census is between 30 percent and 34 percent; and for the 30 percent of the married Negro veterans who were living doubled-up, the chances are two out of three that the rate would have been between 24 percent and 36 percent. Since the sampling variability of any percentage depends not only on the value of the percent, but also on the size of the base on which the percentage is determined, the variations shown in the examples should not be applied indiscriminately to all percentages quoted in this report.

In addition to sampling variability, the estimates are subject to errors of response. Such errors may be expected to affect the sample estimates to about the same degree as they would affect the results of a complete census.

The number of World War II veterans shown in this report is an estimate of the number of veterans in the locality exclusive of those in institutions and hotels. This figure was based on the weighted sample results and on an independent estimate derived from the distribution of veterans by state of preservice residence and the proportion of 1-C Selective Service registrants in the locality. This estimate is only a rough approximation but is the best that can be made from the limited information available.

The number of dwelling units in the city is an estimate based on the weighted sample results and the 1940 census data plus building permit records.

November 29, 1946 DEPARTMENT OF COMMERCE Bureau of the Census Population: HVet-No. 66

Survey of World War II Veterans and Dwelling Unit Vacancy and Occupancy in Asheville, N. C.

Approximately one out of four married white World War II veterans and two out of five married Negro veterans in Asheville were doubling up with relatives or friends or were living in rented rooms, trailers, or tourist cabins according to the results of a sample survey released today by Director J. C. Capt, Bureau of the Census. The survey, made during July at the request of the National Housing Agency for the Veterans Emergency Housing Program, further showed that one in four married white veterans and about two in four married Negro veterans lived in dwelling units which needed major repairs or lacked one or more standard plumbing facilities—running water, private flush toilet, and private bath.

Of the estimated 5,000 World War II veterans living in Asheville at the time of the survey, 4,200 were white and 800 were Negro. About three-fifths of the white veterans were married and two-fifths were single, widowed, or divorced. Among the Negro veterans, the proportions of married and single were about the same as among the white veterans.

The survey also inquired into the housing plans of all the veterans for the next 12 months. When asked what they would do if housing would be available during the next year only at present prices and quality, 21 percent of the white veterans said they would be in the housing market—14 percent would buy or build a house and 7 percent would move and rent. Of the Negro veterans, 22 percent would be in the housing market—16 percent would buy or build and 6 percent would move and rent.

An additional 21 percent of the white veterans and 32 percent of the Negro veterans would be drawn into the housing market if they could find houses at the price, size, and quality they desire. Under such conditions, a total of 38 percent of the white veterans and 47 percent of the Negro veterans would buy or build a house within the next 12 months; and 4 percent of the white and 7 percent of the Negro veterans would move and rent.

VETERANS' HOUSING PLANS FOR THE NEXT 12 MONTHS

Of those who plan to buy or build in the present market, three-fifths of the white veterans indicated they are able to pay less than $5,000 and three-fifths of the Negro veterans reported they are able to pay less than $3,000.

Among the white veterans who would buy or build if houses are available at the price and quality they desire, the average (median) price they reported they would be able to pay for a house was $4,700 and the average (median) gross monthly payment they would be able to make, including real estate taxes, fire insurance, heat, light, and cooking fuel, was $41. Their average (median) weekly income from all sources was $46. The average size house they desired was five rooms. Negro veterans who would buy or build under these conditions reported an average monthly payment of $28, an average weekly income of $31, and desired an average size house of five rooms. Three-fifths of these Negro veterans reported they would be able to pay less than $3,000 and one-tenth could pay $4,000 or more.

Among the white veterans who would move and rent other quarters if they could get what they wanted, the average gross monthly rental they reported they would be able to pay was $37, their average weekly income was $41, and the average size unit they desired was four rooms. For Negro veterans who would move and rent, the average monthly rental reported was $24, their average weekly income was $31, and the average size unit they desired was four rooms.

GENERAL CHARACTERISTICS OF VETERANS

Of the estimated 5,000 veterans living in Asheville at the time of the survey, less than one-fourth (23 percent) were newcomers to the locality since they entered the service. The proportion of in-migrants for married veterans was considerably higher than the proportion for single veterans. (See table 1 on page 5.)

Nine-tenths (89 percent) of the married white veterans and six-tenths (60 percent) of the single white veterans were employed. Of the Negro veterans, 76 percent of the married and 52 percent of the single were employed. Veterans in the "other than employed" group included those who did not desire work at the time of the survey as well as those who were seeking employment. About one-half of all the veterans who were not working had been discharged since December 31, 1945.

For all veterans, the average (median) weekly income from all sources was $37. Income for white veterans averaged $48 for the married as compared with $30 for the single. Among the Negro veterans, there was less difference--$31 for the married and $28 for the single. Average income was based on all veterans including those who reported having no income.

PRESENT LIVING ARRANGEMENTS OF VETERANS

Hardship among veterans was partly reflected by the extent to which they were doubling up with relatives or friends or were living in rented rooms, trailers, or tourist cabins. One-fifth (20 percent) of the married white veterans and about two-fifths (38 percent) of the married Negro veterans were doubling up in ordinary dwelling units, that is, were living in units which contained, in addition to the head of the household, one or more married couples or married women whose husbands were living elsewhere. Six percent of the single white veterans as compared with four percent of the married white veterans were living in rented rooms, trailers, or tourist cabins. For the Negro veterans, these proportions were eight percent for the single and four percent for the married. (See table 2 on page 5.)

Exclusive of those living in rented rooms, about one-fifth of the total white veterans and almost one-half of the total Negro veterans lived in dwelling units which were in need of major repairs or lacked one or more standard plumbing facilities.

Approximately one-fourth (23 percent) of the married white and less than one-tenth (7 percent) of the married Negro veterans owned their homes. (See table 2 on page 5.) One-half of the married white and two-thirds of the married Negro owners purchased their homes after they were discharged. More than two-fifths (44 percent) of the married white veterans and one-third (34 percent) of the married Negro veterans were renting dwelling units in their names at the time of the survey and were paying an average (median) gross monthly rent of $37 and $19 respectively. Seven-tenths of the white veterans and about one-half of the Negro veterans who were renting acquired their units after they were discharged.

HOUSING PLANS OF VETERANS

Nine-tenths (90 percent) of the total veterans plan to remain in the Asheville locality for the coming year. Four percent of the veterans plan to leave the locality and six percent are undecided in their plans. (See table 3 on page 6.)

If housing is available during the year only at present prices and quality, 14 out of every 100 white veterans plan to buy or build in the locality, 7 plan to move and rent, 68 plan to remain in their present quarters, and the remaining 11 plan to move into rented rooms or double up, leave the area, or are undecided. Out of every 100 Negro veterans, 16 plan to buy or build, 6 plan to move and rent, 66 plan to remain in their present quarters, and the remaining 12 have other plans.

However, if the veterans could find what they want, 38 out of every 100 white veterans would buy or build a house, 4 would move and rent, and only 47 would remain in their present quarters during the coming year. (See table 5 on page 6.) If the Negro veterans could find what they want, 47 out of every 100 would buy or build a house, 7 would move and rent, and only 35 would remain in their present quarters.

35730

For the white veterans who would buy or build if they could find what they want, the average (median) price house they said they could afford was $4,700 and one-fourth of the veterans could pay only $3,500 or even less. One-tenth of the Negro veterans desiring to buy or build reported they could afford to pay a price of $4,000 or more with three-fifths able to pay less than $3,000. (See table 4 on page 6.) About four-fifths of the white veterans preferred five- or six-room houses and three-fourths of the Negro veterans preferred four- or five-room houses. Approximately one-half of the white veterans and one-third of the Negro veterans who would buy or build a house have taken some action toward buying or building or have saved money specifically for a house.

Practically all of the prospective home owners would purchase through monthly payments. The gross monthly payments they reported they would be able to make, including real estate taxes, fire insurance, heat, light, and cooking fuel, averaged $41 for white veterans and $28 for Negro veterans. One-fourth of the white veterans planning to buy or build reported they could pay only $33 or less and one-fourth of the Negro veterans could pay only $23 or less.

For the veterans who would move and rent if they could find what they want, the average (median) gross monthly rental they reported they would be able to pay, including payments for heat, light, and cooking fuel, was $37 for white and $24 for Negro veterans. Units in single-family structures were preferred by three-fourths of all the veterans who would like to rent.

AVAILABILITY AND CHARACTERISTICS OF PRESENT HOUSING

In conjunction with the survey of veterans to determine their general characteristics, present living arrangements and housing plans, information on occupancy and vacancy in dwelling units was collected. Tables 6, 7, and 8 on the following pages summarize the availability and characteristics of vacant dwelling units and tenure, rent, facilities, and doubling-up in occupied dwelling units.

The survey showed that 1.3 percent of all the dwelling units in the city were unoccupied. Among units in white neighborhoods, the gross vacancy rate was 1.2 percent, and in Negro neighborhoods, 1.4 percent.

About three-fourths of the vacancies were habitable; of these, four-fifths were equipped with installed cooking facilities. One-fifth of the habitable vacancies were being offered for rent or sale and the remainder were either already rented or sold or were being held off the rental or sale market for other reasons.

About seven-eighths (85 percent) of the habitable vacancies were built before 1930. More than two-fifths (42 percent) had been vacant one month or longer, and one-fourth (25 percent) lacked one or more standard plumbing facilities. Four-fifths of the habitable vacancies were units in single-family structures, and the average size was six rooms.

The survey further showed that 18 percent of the dwelling units in which white veterans lived contained doubled-up families as compared with 10 percent for all units occupied by white families. For Negroes the proportions were 28 percent and 13 percent respectively. (See table 7 on page 7.) About nine-tenths of the veteran-occupied units with doubled-up families contained one or more married couples in addition to the head of the household while one-tenth contained only married women in addition to the head.

Almost one-half (47.4 percent) of all the dwelling units in Asheville were occupied by their owners and slightly more than one-half (51.3 percent) were occupied by tenants. The average (median) monthly contract rent was $28 for units occupied by white tenants and $12 for those occupied by Negro tenants. (See tables 6 and 7 on page 7.) Among the tenant units containing one or more veterans, the average monthly rental was $29 for units occupied by white families and $13 for those occupied by Negroes. These units were rented by the heads of the households and not necessarily by the veterans themselves.

The proportions of owner-occupied and tenant-occupied dwelling units in July 1946 represent a considerable shift from tenant-occupancy to owner-occupancy since April 1940 when a complete enumeration in the Census of Housing showed that 30.3 percent of all the dwelling units in the city were occupied by their owners and 65.3 percent were occupied by tenants.

35730

TECHNICAL NOTE

The findings presented in this report are based on a sample survey in the city of Asheville. For dwelling unit occupancy and vacancy characteristics, approximately 5,200 dwelling units were enumerated to represent all sections of the city and all types of residential structures except institutions, publicly financed housing projects, transient hotels, commercial rooming houses, trailers, and tourist cabins. For information on veterans' housing characteristics and intentions, the enumeration was extended to include veterans in all types of residential structures except institutions and transient hotels.

Because the percentages in this report are based on data obtained from a sample of dwelling units and veterans, they may vary somewhat from the results which would have been obtained from a complete census of the city. The following are examples of the magnitude of the sampling variations and the probability of their occurrence for three of the more significant statistics quoted in this report. For the 39 percent of the total veterans who would like to buy or build a house, the chances are two out of three that the rate which would have been obtained by a complete census is between 37 percent and 41 percent. For the 20 percent of the married white veterans who were living doubled-up, the chances are two out of three that the rate which would have been obtained by a complete census is between 18 percent and 22 percent, and for the 38 percent of the married Negro veterans who were living doubled-up, the chances are two out of three that the rate would have been between 33 percent and 43 percent. Since the sampling variability of any percentage depends not only on the value of the percent, but also on the size of the base on which the percentage is determined, the variations shown in the examples should not be applied indiscriminately to all percentages quoted in this report.

In addition to sampling variability, the estimates are subject to errors of response. Such errors may be expected to affect the sample estimates to about the same degree as they would affect the results of a complete census.

The number of World War II veterans shown in this report is an estimate of the number of veterans in the locality exclusive of those in institutions and hotels. This figure was based on the weighted sample results and on an independent estimate derived from the distribution of veterans by state of preservice residence and the proportion of 1-C Selective Service registrants in the locality. This estimate is only a rough approximation but is the best that can be made from the limited information available.

The number of dwelling units in the city is an estimate based on the weighted sample results and the 1940 census data plus building permit records.

December 2, 1946 DEPARTMENT OF COMMERCE Bureau of the Census Population: HVet-No. 67

Survey of World War II Veterans and Dwelling Unit Vacancy and Occupancy in the Birmingham Area, Alabama

Approximately two-fifths of the married white World War II veterans and one-half of the married Negro veterans in the Birmingham area were doubling up with relatives or friends or were living in rented rooms, trailers, or tourist cabins according to the results of a sample survey released today by Director J. C. Capt, Bureau of the Census. The survey, made during July at the request of the National Housing Agency for the Veterans Emergency Housing Program, further showed that nearly one-third of the married white veterans and two-thirds of the married Negro veterans lived in dwelling units which needed major repairs or lacked one or more standard plumbing facilities--running water, private flush toilet, and private bath.

Of the estimated 30,000 World War II veterans living in the Birmingham area at the time of the survey, 21,000 were white and 9,000 were Negro. About three-fifths of the white veterans were married and two-fifths were single, widowed, or divorced. Among the Negro veterans, the proportions of married and single were approximately the same as among the white veterans.

The survey also inquired into the housing plans of all the veterans for the next 12 months. When asked what they would do if housing would be available during the next year only at present prices and quality, 17 percent of the white veterans said they would be in the housing market--7 percent would buy or build a house and 10 percent would move and rent. Of the Negro veterans, 19 percent would be in the housing market--8 percent would buy or build and 11 percent would move and rent.

An additional 19 percent of the white veterans and 18 percent of the Negro veterans would be drawn into the housing market if they could find houses at the price, size, and quality they desire. Under such conditions, a total of 27 percent of the white veterans and 24 percent of the Negro veterans would buy or build a house within the next 12 months; and 9 percent of the white and 13 percent of the Negro veterans would move and rent.

VETERANS' HOUSING PLANS FOR THE NEXT 12 MONTHS

Of those who plan to buy or build in the present market, three-fifths of the white veterans indicated they are able to pay less than $6,000 and three-fifths of the Negro veterans reported they are able to pay less than $3,000.

Among the white veterans who would buy or build if houses are available at the price and quality they desire, the average (median) price they reported they would be able to pay for a house was $5,100 and the average (median) gross monthly payment they would be able to make including payments for real estate taxes, fire insurance, heat, light, and cooking fuel, was $40. Their average (median) weekly income from all sources was $47. The average size house they desired was five rooms. Negro veterans who would buy or build under these conditions reported an average monthly payment of $26, an average weekly income of $32, and desired an average size house of four rooms. Seven-tenths of these Negro veterans reported they would be able to pay less than $3,000.

Among the white veterans who would move and rent other quarters if they could get what they wanted, the average gross monthly rental they reported they would be able to pay was $35, their average weekly income was $39, and the average size unit they desired was four rooms. For Negro veterans who would move and rent, the average monthly rental reported was $16, their average weekly income was $28, and the average size unit they desired was three rooms.

GENERAL CHARACTERISTICS OF VETERANS

Of the estimated 30,000 veterans living in the Birmingham area at the time of the survey, about one-tenth (12 percent) were newcomers to the locality since they entered the service. The proportion of in-migrants for married white veterans was slightly higher than the proportion for single white veterans, while the proportions of Negro in-migrants were about the same for married as for single veterans. (See table 1 on page 5.)

Approximately nine-tenths (87 percent) of the married white veterans and five-tenths (52 percent) of the single white veterans were employed. Of the Negro veterans, 84 percent of the married and 67 percent of the single were employed. Veterans in the "other than employed" group included those who did not desire work at the time of the survey as well as those who were seeking employment. Three-fifths of all the veterans who were not working had been discharged since December 31, 1945.

For all veterans, the average (median) weekly income from all sources was $35. Income for white veterans averaged $47 for the married as compared with $29 for the single. Among the Negro veterans, there was less difference--$31 for the married and $28 for the single. Average income was based on all veterans including those who reported having no income.

PRESENT LIVING ARRANGEMENTS OF VETERANS

Hardship among veterans was partly reflected by the extent to which they were doubling up with relatives or friends or were living in rented rooms, trailers, or tourist cabins. One-third (34 percent) of the married white veterans and two-fifths (41 percent) of the married Negro veterans were doubling up in ordinary dwelling units, that is, were living in units which contained, in addition to the head of the household, one or more married couples or married women whose husbands were living elsewhere. Twelve percent of the single white veterans as compared with three percent of the married white veterans were living in rented rooms, trailers, or tourist cabins. For the Negro veterans, these proportions were nine percent for the single and ten percent for the married. (See table 2 on page 5.)

Exclusive of those living in rented rooms, about one-fourth of the total white veterans and two-thirds of the total Negro veterans lived in dwelling units which were in need of major repairs or lacked one or more standard plumbing facilities.

One-sixth (16 percent) of the married white and one-seventh (14 percent) of the married Negro veterans owned their homes. (See table 2 on page 5.) Approximately one-half of the married white and one-third of the married Negro owners purchased their homes after they were discharged. Less than one-half (48 percent) of the married white veterans and about two-fifths (43 percent) of the married Negro veterans were renting dwelling units in their names at the time of the survey and were paying an average (median) gross monthly rent of $32 and $16 respectively. Seven-tenths of the married white veterans and about four-tenths of the married Negro veterans who were renting acquired their units after they were discharged.

HOUSING PLANS OF VETERANS

More than nine-tenths (93 percent) of the total veterans plan to remain in the Birmingham locality for the coming year. Four percent of the veterans plan to leave the locality and three percent are undecided in their plans. (See table 3 on page 6.)

If housing is available during the year only at present prices and quality, 7 out of every 100 white veterans plan to buy or build in the locality, 10 plan to move and rent, 73 plan to remain in their present quarters, and the remaining 10 plan to move into rented rooms or double up, leave the area, or are undecided. Out of every 100 Negro veterans, 8 plan to buy or build, 11 plan to move and rent, 71 plan to remain in their present quarters, and the remaining 10 have other plans.

However, if the veterans could find what they want, 27 out of every 100 white veterans would buy or build a house, 9 would move and rent, and only 54 would remain in their present quarters during the coming year. If the Negro veterans could find what they want, 24 out of every 100 would buy or build a house, 13 would move and rent, and 54 would remain in their present quarters. (See table 5 on page 6.)

35728

For the white veterans who would buy or build if they could find what they want, the average (median) price house they said they could afford was $5,100 and one-fourth of the veterans could pay only $4,200 or even less. Seven-tenths of the Negro veterans desiring to buy or build reported they could afford to pay less than $3,000 and less than one-tenth could pay $4,000 or more. (See table 4 on page 6.) Four-fifths of the white veterans preferred five- or six-room houses and three-fourths of the Negro veterans preferred four- or five-room houses. Approximately three-fifths of the white veterans and two-fifths of the Negro veterans who would buy or build a house have taken some action toward buying or building or have saved money specifically for a house.

Practically all of the prospective home owners would purchase through monthly payments. The gross monthly payments they reported they would be able to make, including real estate taxes, fire insurance, heat, light, and cooking fuel, averaged $40 for white veterans and $26 for Negro veterans. One-fourth of the white veterans planning to buy or build reported they could pay only $34 or less and one-fourth of the Negro veterans could pay only $21 or less.

For the veterans who would move and rent if they could find what they want, the average (median) gross monthly rental they reported they would be able to pay, including payments for heat, light, and cooking fuel, was $35 for white and $16 for Negro veterans. Units in single-family structures were preferred by about four-fifths of all the veterans who would like to rent.

AVAILABILITY AND CHARACTERISTICS OF PRESENT HOUSING

In conjunction with the survey of veterans to determine their general characteristics, present living arrangements, and housing plans, information on occupancy and vacancy in dwelling units was collected. Tables 6, 7, and 8 on the following pages summarize the availability and characteristics of vacant dwelling units and tenure, rent, facilities, and doubling-up in occupied dwelling units.

The survey showed that 1.2 percent of all the dwelling units in the Birmingham area, including privately and publicly financed dwelling units, were unoccupied. The gross vacancy rate for privately financed dwelling units alone was 1.3 percent. Among private units in white neighborhoods, the gross vacancy rate was 0.9 percent, and among those in Negro neighborhoods, 1.9 percent.

According to the survey, three-fourths of the private vacancies were habitable; of these, about one-sixth lacked installed cooking facilities. One-tenth of the habitable vacancies were being offered for rent or sale and the remainder were either already rented or sold or were being held off the rental or sale market for other reasons.

Nearly nine-tenths (88 percent) of the habitable vacancies were built before 1930, almost one-fifth (17 percent) were located in converted structures (structures in which the number of dwelling units has changed since the original construction), eight-tenths (78 percent) were units in single-family structures without business, and the average size was three rooms.

The survey further showed that 25 percent of the privately financed dwelling units in which white veterans lived contained doubled-up families as compared with 10 percent for all private units occupied by white families. For Negroes, the proportions were 31 percent and 11 percent, respectively. (See table 7 on page 7.) Practically all of the veteran-occupied units with doubled-up families contained one or more married couples in addition to the head of the household while very few contained only married women in addition to the head.

Less than one-half (46.0 percent) of all the private dwelling units in the Birmingham area were occupied by their owners and more than one-half (52.7 percent) were occupied by tenants. The average (median) monthly contract rent was $28 for private units occupied by white tenants and $11 for those occupied by Negro tenants. (See tables 6 and 7 on page 7.) Among the tenant units containing one or more veterans, the average monthly rental was $27 for units occupied by white families and $12 for those occupied by Negroes. These units were rented by the heads of the households and not necessarily by the veterans themselves.

35728

The proportions of owner-occupied and tenant-occupied dwelling units in July 1946 represent a considerable shift from tenant-occupancy to owner-occupancy since April 1940 when a complete enumeration in the Census of Housing showed that 30.3 percent of all the dwelling units in the area were occupied by their owners and 67.3 percent were occupied by tenants.

TECHNICAL NOTE

The findings presented in this report are based on a sample survey in Birmingham city, Bessemer city, Fairfield city, Homewood city, Irondale town, Lipscomb town, and Tarrant City. For dwelling unit occupancy and vacancy characteristics, approximately 4,100 dwelling units were enumerated to represent all sections of the area and all types of residential structures except institutions, publicly financed housing projects, transient hotels, commercial rooming houses, trailers, and tourist cabins. For information on veterans' housing characteristics and intentions, the enumeration was extended to include veterans in all types of residential structures except institutions and transient hotels. Occupancy and vacancy data for publicly financed housing for the Birmingham locality were obtained from reports of the National Housing Agency as of the end of June.

Because the percentages in this report are based on data obtained from a sample of dwelling units and veterans, they may vary somewhat from the results which would have been obtained from a complete census of the area. The following are examples of the magnitude of the sampling variations and the probability of their occurrence for three of the more significant statistics quoted in this report. For the 26 percent of the total veterans who would like to buy or build a house, the chances are two out of three that the rate which would have been obtained by a complete census is between 24 percent and 28 percent. For the 34 percent of the married white veterans who were living doubled-up, the chances are two out of three that the rate would have been between 31 percent and 37 percent; and for the 41 percent of the married Negro veterans who were living doubled-up the chances are two out of three that the rate would have been 35 percent and 47 percent. Since the sampling variability of any percentage depends not only on the value of the percent but also on the size of the base on which the percentage is determined, the variations shown in the examples should not be applied indiscriminately to all percentages quoted in this report.

In addition to sampling variability, the estimates are subject to errors of response. Such errors may be expected to affect the sample estimates to about the same degree as they would affect the results of a complete census.

The number of World War II veterans shown in this report is an estimate of the number of veterans in the locality exclusive of those in institutions and hotels. This figure was based on the weighted sample results and on an independent estimate derived from the distribution of veterans by state of preservice residence and the proportion of 1-C Selective Service registrants in the locality. This estimate is only a rough approximation but is the best that can be made from the limited information available.

The number of privately financed dwelling units in the area is an estimate based on the weighted sample results and the 1940 census data plus building permit records.

35728

Total	100%	100%	100%	100%	100%
Living in rented rooms, trailers, or tourist cabins	8	3	12	10	9
Living in ordinary dwelling units	92	97	88	90	91
Doubled-up[1]	27	34	15	41	14
Not doubled-up	65	63	73	49	77
Condition and Plumbing Facilities					
All veterans living in ordinary dwelling units	92%	97%	88%	90%	91%
In good condition or in need of minor repairs	79	88	82	68	63
Having all standard plumbing facilities[2]	55	66	73	26	23
Lacking one or more standard plumbing facilities	24	22	9	42	40
In need of major repairs or unfit for use	13	9	6	22	28
Having all standard plumbing facilities	2	3	2	2	1
Lacking one or more standard plumbing facilities	11	6	4	20	27
Tenure and Rent					
All veterans living in ordinary dwelling units	92%	97%	88%	90%	91%
Owned by veteran	10	16	2	14	1
Rented by veteran	28	48	2	43	5
Other	54	33	84	33	85
Average (median) monthly gross rent for units rented by veteran	$26	$32	([3])	$16	([3])
One-fourth of the units rented for less than	$18	$24	([3])	$13	([3])
One-fourth of the units rented for more than	$37	$40	([3])	$21	([3])

[1] For purposes of this survey, a veteran was considered as living doubled-up if he lived in a dwelling unit which contained more than one family, that is, the unit contained, in addition to the head of the household, married couples or married women with husbands absent.

[2] Standard plumbing facilities included running water in the unit, private flush toilet in the structure, and private installed bathtub or shower in the structure.

[3] There were too few single veterans in the sample who rented their dwelling units to quote average monthly rental.

[1] Other plans included move into a rented room or double up, leave the locality, and undecided.

[2] Less than 0.5 percent.

Table 6.—VACANCY AND OCCUPANCY IN PRIVATELY AND PUBLICLY FINANCED DWELLING UNITS

Birmingham Area, Alabama

SUBJECT	Private and public dwelling units[1]	PRIVATE DWELLING UNITS		
		Total	White	Negro
Estimated total number of dwelling units	94,210	91,000	56,000	35,000
Percent: Total	100.0%	100.0%	100.0%	100.0%
Occupied	98.8	98.7	99.1	98.1
Owner-occupied	44.4	46.0	59.0	24.8
Tenant-occupied	54.4	52.7	40.1	73.3
Unoccupied	1.2	1.3	0.9	1.9
Habitable[2]	1.0	1.0	[4]0.8	[4]1.3
Rental	0.3	0.3	0.3	0.2
Offered for rent	0.1	0.1	0.2	([5])
Rented, not yet occupied	0.2	0.2	0.1	0.2
Sale	0.2	0.2	0.3	0.1
For sale, only	([5])	([5])	([5])	([5])
Sold, not yet occupied	0.2	0.2	0.3	0.1
Other[3]	0.5	0.5	0.2	1.0
Not habitable	0.2	0.3	0.1	0.6

[1] The public housing included all the publicly financed dwelling units which serve the Birmingham area covered in this survey.

[2] Included as habitable were units in good condition or in need of only minor repairs and those in need of major repairs which were in no worse condition than similar occupied units in the same neighborhood.

[3] Other vacancies included units undergoing extensive repairs, units to be demolished, units in litigation, etc.

[4] Approximately one-seventh of the habitable vacancies for white occupancy and one-sixth for Negro occupancy lacked installed cooking facilities for the exclusive use of the intended occupants.

[5] Less than 0.05 percent.

Table 7.—CHARACTERISTICS OF ALL PRIVATELY FINANCED DWELLING UNITS

Birmingham Area, Alabama

CHARACTERISTIC	Total	White	Negro
Estimated total number of privately financed dwelling units	91,000	56,000	35,000
Percent: Total	100.0%	100.0%	100.0%
Occupied	98.7	99.1	98.1

DEPARTMENT OF COMMERCE
Bureau of the Census

Population: HVet-No. 69

Survey of World War II Veterans and Dwelling Unit Vacancy and Occupancy in the Memphis Area, Tennessee

Approximately one-half of the married white World War II veterans and one-half of the married Negro veterans in the Memphis area were doubling up with relatives or friends or were living in rented rooms, trailers, or tourist cabins according to the results of a sample survey released today by Director J. C. Capt, Bureau of the Census. The survey, made during early August at the request of the National Housing Agency for the Veterans Emergency Housing Program, further showed that one-tenth of the married white veterans and about six-tenths of the married Negro veterans lived in dwelling units which needed major repairs or lacked one or more standard plumbing facilities—running water, private flush toilet, and private bath.

Of the estimated 30,000 World War II veterans living in the Memphis area at the time of the survey, 22,800 were white and 7,200 were Negro. Two-thirds of the white veterans were married and one-third were single, widowed, or divorced. Among the Negro veterans, almost three-fifths were married.

The survey also inquired into the housing plans of all the veterans for the next 12 months. When asked what they would do if housing would be available during the next year only at present prices and quality, 18 percent of the white veterans said they would be in the housing market—12 percent would buy or build a house and 6 percent would move and rent. Of the Negro veterans, 20 percent would be in the housing market--16 percent would buy or build and 4 percent would move and rent.

An additional 21 percent of the white veterans and 23 percent of the Negro veterans would be drawn into the housing market if they could find houses at the price, size, and quality they desire. Under such conditions, a total of 32 percent of the white veterans and 35 percent of the Negro veterans would buy or build a house within the next 12 months; and 7 percent of the white and 8 percent of the Negro veterans would move and rent.

VETERANS' HOUSING PLANS FOR THE NEXT 12 MONTHS

Of those who plan to buy or build in the present market, the white veterans indicated they are able to pay an average (median) price of $6,600 and Negro veterans reported they are able to pay $3,500.

Among the white veterans who would buy or build if houses are available at the price and quality they desire, the average (median) price they reported they would be able to pay for a house was $6,400 and the average (median) gross monthly payment they would be able to make, including real estate taxes, fire insurance, heat, light, and cooking fuel, was $50. Their average (median) weekly income from all sources was $52. The average size house they desired was five rooms. Negro veterans who would buy or build under these conditions reported an average price of $3,400, an average monthly payment of $28, and an average weekly income of $31. The average size house Negro veterans desired was five rooms.

Among all veterans who would move and rent other quarters if they could get what they wanted, the average gross monthly rental they reported they would be able to pay was $43, their average weekly income was $41, and the average size unit they desired was four rooms.

36018

GENERAL CHARACTERISTICS OF VETERANS

Of the estimated 30,000 veterans living in the Memphis area at the time of the survey, about one-fifth (21 percent) were newcomers to the locality since they entered the service. The proportion of in-migrants for married veterans was somewhat higher than the proportion for single veterans. (See table 1 on page 5.)

Nine-tenths (91 percent) of the married white veterans and six-tenths (60 percent) of the single white veterans were employed. Of the Negro veterans, 86 percent of the married and 75 percent of the single were employed. Veterans in the "other than employed" group included those who did not desire work at the time of the survey as well as those who were seeking employment. About three-fifths of all the veterans who were not working had been discharged since December 31, 1945.

For all veterans, the average (median) weekly income from all sources was $40. Income for white veterans averaged $52 for the married as compared with $29 for the single. Among the Negro veterans there was less difference—$30 for the married and $26 for the single. (Average income was based on all veterans, including those who reported having no income.)

PRESENT LIVING ARRANGEMENTS OF VETERANS

Hardship among veterans was partly reflected by the extent to which they were doubling up with relatives or friends or were living in rented rooms, trailers, or tourist cabins. Over one-fourth (27 percent) of the married white veterans and not quite one-fourth (23 percent) of the married Negro veterans were doubling up in ordinary dwelling units, that is, were living in units which contained, in addition to the head of the household, one or more married couples or married women whose husbands were living elsewhere. Twenty-seven percent of the single white veterans as compared with 18 percent of the married white veterans were living in rented rooms, trailers, or tourist cabins. For the Negro veterans, these proportions were 36 percent for the single and 23 percent for the married. (See table 2 on page 5.)

Exclusive of those living in rented rooms, about one-tenth of the total white veterans and nearly three-fifths of the total Negro veterans lived in dwelling units which were in need of major repairs or lacked one or more standard plumbing facilities.

One-fourth (24 percent) of the married white and one-tenth (11 percent) of the married Negro veterans owned their homes. (See table 2 on page 5.) About one-half of both the white and the Negro owners purchased their homes after they were discharged. One-third (33 percent) of the married white veterans and almost one-half (48 percent) of the married Negro veterans were renting dwelling units in their names at the time of the survey and were paying an average (median) gross monthly rent of $41 and $15 respectively. Three-fifths of the white veterans and two-fifths of the Negro veterans who were renting acquired their units after they were discharged.

HOUSING PLANS OF VETERANS

More than nine-tenths (92 percent) of the total veterans plan to remain in the Memphis locality for the coming year. Four percent of the veterans plan to leave the locality and four percent are undecided in their plans. (See table 3 on page 6.)

If housing is available during the year only at present prices and quality, 12 out of every 100 white veterans plan to buy or build in the locality, 6 plan to move and rent, 73 plan to remain in their present quarters, and the remaining 9 plan to move into rented rooms or double up, leave the area, or are undecided. Out of every 100 Negro veterans, 16 plan to buy or build, 4 plan to move and rent, 72 plan to remain in their present quarters, and the remaining 8 have other plans.

However, if the veterans could find what they want, 32 out of every 100 white veterans would buy or build a house, 7 would move and rent, and only 52 would remain in their present quarters during the coming year. If the Negro veterans could find what they want, 35 out of every 100 would buy or build a house, 8 would move and rent, and 49 would remain in their present quarters. (See table 5 on page 6.)

36018

For the white veterans who would buy or build if they could find what they want, the average (median) price house they said they could afford was $6,400 and one-fourth of the veterans could pay only $5,300 or even less. Negro veterans desiring to buy or build reported they could afford to pay an average price of $3,400; with one-third able to pay only $3,000 or even less. Almost nine-tenths of the white veterans preferred five- or six-room houses and more than eight-tenths of the Negro veterans preferred four- or five-room houses. Three-fifths of the white veterans and two-fifths of the Negro veterans who would buy or build a house have taken some action toward buying or building or have saved money specifically for a house.

Practically all of the prospective home owners would purchase through monthly payments. The gross monthly payments they reported they would be able to make, including real estate taxes, fire insurance, heat, light, and cooking fuel, averaged $50 for white veterans and $28 for Negro veterans. However, one-fourth of the white veterans planning to buy or build reported they could pay only $42 or less and one-fourth of the Negro veterans could pay only $23 or less.

For the white veterans who would move and rent if they could find what they want, the average (median) gross monthly rental they reported they would be able to pay, including payments for heat, light, and cooking fuel, was $47. One-fourth of the veterans could afford only $41 or less. Of the Negro veterans who would move and rent if they could find what they want, two-thirds reported they are able to pay $15 or less monthly. Units in single-family structures were preferred by three-fourths of all the veterans who would like to rent.

AVAILABILITY AND CHARACTERISTICS OF PRESENT HOUSING

In conjunction with the survey of veterans to determine their general characteristics, present living arrangements and housing plans, information on occupancy and vacancy in dwelling units was collected. Tables 6, 7, and 8 on the following pages summarize the availability and characteristics of vacant dwelling units and tenure, rent, facilities, and doubling up in occupied dwelling units.

The survey showed that 0.7 percent of all the dwelling units in the Memphis area including privately and publicly financed dwelling units, were unoccupied. The gross vacancy rate for privately financed dwelling units alone was 0.8 percent in white neighborhoods and 0.7 percent in Negro neighborhoods. These rates indicate a slight increase in the number of unoccupied dwelling units in the area since September 1944. At that time, a similar survey made by the Bureau of Labor Statistics showed gross vacancy rates of 0.6 percent in white and 0.3 percent in Negro sections.

According to the recent survey seven-eighths of the private vacancies were habitable; of these, about two-fifths lacked installed cooking facilities. About one-half of the habitable vacancies were being offered for rent or sale and the remainder were either already rented or sold or were being held off the rental or sale market for other reasons.

Nearly one-half (48 percent) of the habitable vacancies were built before 1930, one-fourth (26 percent) had been vacant one month or longer, one-fourth (24 percent) lacked one or more of the standard plumbing facilities, and the average size was four rooms.

The survey further showed that 27 percent of the privately financed dwelling units in which white veterans lived contained doubled-up families as compared with 14 percent for all private units occupied by white families. For Negroes the proportions were 23 percent and 9 percent respectively. (See table 7 on page 7.) Practically all of the veteran-occupied units with doubled-up families contained one or more married couples in addition to the head of the household while very few contained only married women in addition to the head.

Nearly one-half (48.2 percent) of all the private dwelling units in the area were occupied by their owners and slightly more than one-half (51.0 percent) were occupied by tenants. The average (median) monthly contract rent was $37 for private units occupied by white tenants and $12 for those occupied by Negro tenants. (See tables 6 and 7 on page 7.) Among the tenant units containing one or more veterans, the average monthly rental was $37 for units occupied by white families and $13 for those occupied by Negroes. These units were rented by the heads of the households and not necessarily by the veterans themselves.

36018

Separate analysis for Memphis city alone showed that 47.5 percent of all the private dwelling units were owner-occupied and 51.7 were tenant-occupied. These proportions represent a considerable shift from tenant-occupancy to owner-occupancy since April 1940 when a complete enumeration in the Census of Housing showed that 29.8 percent of all the dwelling units in the city of Memphis were occupied by their owners and 67.6 percent were occupied by tenants.

TECHNICAL NOTE

The findings presented in this report are based on a sample survey in Memphis, Bartlett, Berclair, Noncomnah Neighborhood, Raleigh, Rugby Hills, the area directly adjacent to the city on the northeast bounded by Heard Road and Graham Road, and the area directly adjacent to the city on the southeast bounded by Shotwell Road and Kimball Road. For dwelling unit occupancy and vacancy characteristics, approximately 7,200 dwelling units were enumerated to represent all sections of the area and all types of residential structures except institutions, publicly financed housing projects, transient hotels, commercial rooming houses, trailers, and tourist cabins. For information on veterans' housing characteristics and intentions, the enumeration was extended to include veterans in all types of residential structures except institutions and transient hotels. Occupancy and vacancy data for publicly financed housing for the Memphis locality were obtained from reports of the National Housing Agency as of the end of July.

Because the percentages in this report are based on data obtained from a sample of dwelling units and veterans, they may vary somewhat from the results which would have been obtained from a complete census of the area. The following are examples of the magnitude of the sampling variations and the probability of their occurrence for three of the more significant statistics quoted in this report. For the 32 percent of the total veterans who would like to buy or build a house, the chances are two out of three that the rate which would have been obtained by a complete census is between 30 percent and 34 percent. For the 27 percent of the married white veterans who were living doubled-up, the chances are two out of three that the rate which would have been obtained by a complete census is between 25 percent and 29 percent; and for the 23 percent of the married Negro veterans who were living doubled-up, the chances are two out of three that the rate would have been between 19 percent and 27 percent. Since the sampling variability of any percentage depends not only on the value of the percent, but also on the size of the base on which the percentage is determined, the variations shown in the examples should not be applied indiscriminately to all percentages quoted in this report.

In addition to sampling variability, the estimates are subject to errors of response. Such errors may be expected to affect the sample estimates to about the same degree as they would affect the results of a complete census.

The number of World War II veterans shown in this report is an estimate of the number of veterans in the locality exclusive of those in institutions and hotels. This figure was based on the weighted sample results and on an independent estimate derived from the distribution of veterans by state of preservice residence and the proportion of 1-C Selective Service registrants in the locality. This estimate is only a rough approximation but is the best that can be made from the limited information available.

The number of privately financed dwelling units in the area is an estimate based on the weighted sample results and the 1940 census data plus building permit records.

Total	100%	100%	100%	100%	100%
Living in rented rooms, trailers, or tourist cabins	22	18	27	23	36
Living in ordinary dwelling units	78	82	73	77	64
Doubled-up[1]	22	27	13	23	7
Not doubled-up	56	55	60	54	57
Condition and Plumbing Facilities					
All veterans living in ordinary dwelling units	78%	82%	73%	77%	64%
In good condition or in need of minor repairs	71	81	71	50	47
Having all standard plumbing facilities[2]	56	72	63	14	16
Lacking one or more standard plumbing facilities	15	9	8	36	31
In need of major repairs or unfit for use	7	1	2	27	17
Having all standard plumbing facilities	1	([3])	1	3	1
Lacking one or more standard plumbing facilities	6	1	1	24	16
Tenure and Rent					
All veterans living in ordinary dwelling units	78%	82%	73%	77%	64%
Owned by veteran	15	24	3	11	2
Rented by veteran	25	33	2	48	4
Other	38	25	68	18	58
Average (median) monthly gross rent for units rented by veteran	$32	$41	([4])	$15	([4])
One-fourth of the units rented for less than	$19	$30	([4])	$12	([4])
One-fourth of the units rented for more than	$47	$53	([4])	$20	([4])

[1] For purposes of this survey, a veteran was considered as living doubled-up if he lived in a dwelling unit which contained more than one family, that is, the unit contained, in addition to the head of the household, married couples or married women with husbands absent.

[2] Standard plumbing facilities included running water in the unit, private flush toilet in the structure, and private installed bathtub or shower in the structure.

[3] Less than 0.5 percent.

[4] There were too few single veterans in the sample who rented their dwelling units to quote average monthly rental.

December 10, 1946 DEPARTMENT OF COMMERCE Bureau of the Census Population: HVet-No. 70

Survey of World War II Veterans and Dwelling Unit Vacancy and Occupancy in Montgomery, Ala.

Approximately three-tenths of the married white World War II veterans and one-third of the married Negro veterans in Montgomery city were doubling up with relatives or friends or were living in rented rooms, trailers, or tourist cabins according to the results of a sample survey released today by Director J. C. Capt, Bureau of the Census. The survey, made during early August at the request of the National Housing Agency for the Veterans Emergency Housing Program, further showed that about three-tenths of the married white veterans and seven-tenths of the married Negro veterans lived in dwelling units which needed major repairs or lacked one or more standard plumbing facilities--running water, private flush toilet, and private bath.

Of the estimated 8,000 World War II veterans living in Montgomery at the time of the survey, 5,400 were white and 2,600 were Negro. Two-thirds of the white veterans were married and one-third were single, widowed, or divorced. Among the Negro veterans, about three in five were married.

The survey also inquired into the housing plans of all the veterans for the next 12 months. When asked what they would do if housing would be available during the next year only at present prices and quality, 27 percent of the white veterans said they would be in the housing market--9 percent would buy or build a house and 18 percent would move and rent. Of the Negro veterans, 26 percent would be in the housing market--11 percent would buy or build and 15 percent would move and rent.

An additional 17 percent of the white veterans and 11 percent of the Negro veterans would be drawn into the housing market if they could find houses at the price, size, and quality they desire. Under such conditions, a total of 30 percent of the white veterans and 19 percent of the Negro veterans would buy or build a house within the next 12 months; and 14 percent of the white and 18 percent of the Negro veterans would move and rent.

VETERANS' HOUSING PLANS FOR THE NEXT 12 MONTHS

Of those who plan to buy or build in the present market, the white veterans indicated they are able to pay an average (median) price of $6,400 and two-thirds of the Negro veterans reported they are able to pay $2,000 or less.

Among the white veterans who would buy or build if houses are available at the price and quality they desire, the average (median) price they reported they would be able to pay for a house was $5,900 and the average (median) gross monthly payment they would be able to make including payments for real estate taxes, fire insurance, heat, light, and cooking fuel was $50. Their average (median) weekly income from all sources was $54. The average size house they desired was six rooms. Seven-tenths of the Negro veterans who would buy or build under these conditions reported that they could pay less than $3,000 and two-tenths could pay $4,000 or more. The average monthly payment they would be able to make was $27 and the average weekly income they reported was $31. The average size house Negro veterans desired was five rooms.

Among the white veterans who would move and rent other quarters if they could get what they wanted, the average gross monthly rental they reported they would be able to pay was $38, their average weekly income was $45, and the average size unit they desired was four rooms. For Negro veterans who would move and rent, the average monthly rental reported was $17, their average weekly income was $29, and the average size unit they desired was four rooms.

36116

GENERAL CHARACTERISTICS OF VETERANS

Of the estimated 8,000 veterans living in Montgomery at the time of the survey, one-fifth (21 percent) were newcomers to the locality since they entered the service. The proportion of in-migrants for white veterans was considerably higher than the proportion for Negro veterans. (See table 1 page 5.)

More than nine-tenths (92 percent) of the married white veterans and almost six-tenths (56 percent) of the single white veterans were employed. Of the Negro veterans, 63 percent of the married and 43 percent of the single were employed. Veterans in the "other than employed" group included those who did not desire work at the time of the survey as well as those who were seeking employment. About one-half of all the veterans who were not working had been discharged since December 31, 1945.

For all veterans, the average (median) weekly income from all sources was $37. Income for white veterans averaged $53 for the married as compared with $31 for the single. Among the Negro veterans there was less difference—$30 for the married and $28 for the single. (Average income was based on all veterans, including those who reported having no income.)

PRESENT LIVING ARRANGEMENTS OF VETERANS

Hardship among veterans was partly reflected by the extent to which they were doubling up with relatives or friends or were living in rented rooms, trailers, or tourist cabins. One-fifth (19 percent) of the married white veterans and almost one-fourth (23 percent) of the married Negro veterans were doubling up in ordinary dwelling units, that is, were living in units which contained, in addition to the head of the household, one or more married couples or married women whose husbands were living elsewhere. Twenty-four percent of the single white veterans as compared with nine percent of the married white veterans were living in rented rooms, trailers, or tourist cabins. For the Negro veterans, these proportions were 23 percent for the single and 13 percent for the married. (See table 2 on page 5.)

Exclusive of those living in rented rooms, about one-fourth of the total white veterans and seven-tenths of the total Negro veterans lived in dwelling units which were in need of major repairs or lacked one or more standard plumbing facilities.

One-sixth (17 percent) of the married white and about the same proportion (18 percent) of the married Negro veterans owned their homes. (See table 2 on page 5.) One-third of the married white and three-tenths of the married Negro owners purchased their homes after they were discharged. Nearly three-fifths (56 percent) of the married white veterans and one-half (50 percent) of the married Negro veterans were renting dwelling units in their names at the time of the survey and were paying an average (median) gross monthly rent of $37 and $14 respectively. Three-fifths of the married white veterans and almost two-fifths of the married Negro veterans who were renting acquired their units after they were discharged.

HOUSING PLANS OF VETERANS

About nine-tenths (87 percent) of the total veterans plan to remain in the Montgomery locality for the coming year. Seven percent of the veterans plan to leave the locality and six percent are undecided in their plans. (See table 3 on page 6.)

If housing is available during the year only at present prices and quality, 9 out of every 100 white veterans plan to buy or build in the locality, 18 plan to move and rent, 57 plan to remain in their present quarters, and the remaining 16 plan to move into rented rooms or double up, leave the area, or are undecided. Out of every 100 Negro veterans, 11 plan to buy or build, 15 plan to move and rent, 59 plan to remain in their present quarters, and the remaining 15 have other plans.

However, if the veterans could find what they want, 30 out of every 100 white veterans would buy or build a house, 14 would move and rent, and only 40 would remain in their present quarters during the coming year. If the Negro veterans could find what they want, 19 out of every 100 would buy or build a house, 18 would move and rent, and 49 would remain in their present quarters. (See table 5 on page 6.)

36116

For the white veterans who would buy or build if they could find what they want, the average (median) price house they said they could afford was $5,900 and one-fourth of the veterans could pay only $5,000 or even less. Seven-tenths of the Negro veterans desiring to buy or build reported they could afford to pay less than $3,000 and two-tenths could pay $4,000 or more. Five-sixths of the white veterans preferred five- or six-room houses and two-thirds of the Negro veterans preferred four- or five-room houses. Two-thirds of the white veterans and about two-fifths of the Negro veterans who would buy or build a house have taken some action toward buying or building or have saved money specifically for a house.

Practically all of the prospective home owners would purchase through monthly payments. The gross monthly payments they reported they would be able to make, including real estate taxes, fire insurance, heat, light, and cooking fuel, averaged $50 for white veterans and $27 for Negro veterans. However, one-fourth of the white veterans planning to buy or build reported they could pay only $41 or less and one-fourth of the Negro veterans could pay only $22 or less.

For the veterans who would move and rent if they could find what they want, the average (median) gross monthly rental they reported they would be able to pay, including payments for heat, light, and cooking fuel, was $38 for white and $17 for Negro veterans. Units in single-family structures were preferred by two-thirds of all the veterans who would like to rent.

AVAILABILITY AND CHARACTERISTICS OF PRESENT HOUSING

In conjunction with the survey of veterans to determine their general characteristics, present living arrangements and housing plans, information on occupancy and vacancy in dwelling units was collected. Tables 6, 7, and 8 on the following pages summarize the availability and characteristics of vacant dwelling units and tenure, rent, facilities, and doubling-up in occupied dwelling units.

The survey showed that 1.0 percent of all the dwelling units in Montgomery including privately and publicly financed dwelling units, were unoccupied. The gross vacancy rate for privately financed dwelling units alone was 1.1 percent, both in white and in Negro neighborhoods. (See table 6 on page 7.)

About seven-tenths of the private vacancies were habitable; of these, one-tenth lacked installed cooking facilities. One-fourth of the habitable vacancies were being offered for rent or sale and the remainder were either already rented or sold or were being held off the rental or sale market for other reasons.

Approximately one-third (35 percent) of the habitable vacancies were built before 1930, almost one-half (47 percent) lacked one or more standard plumbing facilities, over one-fourth (28 percent) were units in 2-, 3-, or 4-family structures, and the average size was four rooms.

One-half of the habitable vacancies were rental units for which the average (median) monthly rental asked was $30 and the average size was three rooms. More than one-half (56 percent) of the rental vacancies lacked one or more standard plumbing facilities, and over two-fifths (42 percent) were located in 2-, 3-, or 4-family structures.

The survey further showed that 19 percent of the privately financed dwelling units in which white veterans lived contained doubled-up families as compared with 12 percent for all private units occupied by white families. For Negroes the proportions were 24 percent and 9 percent respectively. (See table 7 on page 7.) Practically all of the veteran-occupied units with doubled-up families contained one or more married couples in addition to the head of the household while very few contained only married women in addition to the head.

Nearly two-fifths (38.2 percent) of all the private dwelling units in Montgomery were occupied by their owners and three-fifths (60.7 percent) were occupied by tenants. The average (median) monthly contract rent was $30 for private units occupied by white tenants and $8 for those occupied by Negro tenants. (See tables 6 and 7 on page 7.) Among the tenant units containing one or more veterans, the average monthly rental was $31 for units occupied by white families and $8 for those occupied by Negroes. These units were rented by the heads of the households and not necessarily by the veterans themselves.

36116

The proportions of owner-occupied and tenant-occupied dwelling units in August 1946 represent a substantial shift from tenant-occupancy to owner-occupancy since April 1940 when a complete enumeration in the Census of Housing showed that 26.4 percent of all the dwelling units in the area were occupied by their owners and 72.3 percent were occupied by tenants.

TECHNICAL NOTE

The findings presented in this report are based on a sample survey in the city of Montgomery. For dwelling unit occupancy and vacancy characteristics, approximately 6,000 dwelling units were enumerated to represent all sections of the city and all types of residential structures except institutions, publicly financed housing projects, transient hotels, commercial rooming houses, trailers, and tourist cabins. For information on veterans' housing characteristics and intentions, the enumeration was extended to include veterans in all types of residential structures except institutions and transient hotels. Occupancy and vacancy data for publicly financed housing for the Montgomery locality were obtained from reports of the National Housing Agency as of the end of July.

The number of privately financed dwelling units shown in this report for Montgomery city is an estimate based on the weighted sample results and the 1940 census data plus building permit records. The number of World War II veterans shown in this report is an estimate of the number of veterans in the locality exclusive of those in institutions and hotels. This figure was based on the weighted sample results and on an independent estimate derived from the distribution of veterans by state of preservice residence and the proportion of 1-C Selective Service registrants in the locality. This estimate is only a rough approximation but is the best that can be made from the limited information available.

An examination of the results shows that this survey, like practically all others based upon a field canvass of a cross-section of the population, did not cover a proportionate share of the most mobile parts of the population, e.g., veterans who were traveling about preparatory to taking a job and establishing a residence. In addition, some persons who were actually veterans were not identified as such because of inaccurate or inadequate information furnished by the respondents. The characteristics of such groups may not be the same as those of the enumerated veterans, but in the absence of information concerning these characteristics no adjustment has been made in the results of the survey because of this factor.

The figures presented in this report may differ somewhat from the results which would have been obtained by a complete census because of sampling variability. The following are examples of the magnitude of the sampling variations and the probability of their occurrence for three of the more significant statistics quoted in this report. For the 26 percent of the total veterans who would like to buy or build a house, the chances are two out of three that the rate which would have been obtained by a complete census is between 24 percent and 28 percent. For the 19 percent of the married white veterans who were living doubled-up, the chances are two out of three that the rate which would have been obtained by a complete census is between 17 percent and 21 percent; and for the 23 percent of the married Negro veterans who were living doubled-up, the chances are two out of three that the rate would have been between 19 percent and 27 percent. Since the sampling variability of any percentage depends not only on the value of the percent, but also on the size of the base on which the percentage is determined, the variations shown in the examples should not be applied indiscriminately to all percentages quoted in this report.

In addition to sampling variability, the estimates are subject to errors of response. Such errors may be expected to affect the sample estimates to about the same degree as they would affect the results of a complete census.

December 10, 1946 DEPARTMENT OF COMMERCE
Bureau of the Census Population: HVet-No. 73

Survey of World War II Veterans and Dwelling Unit Vacancy and Occupancy in the Fort Worth Area, Texas

Approximately one in three married white World War II veterans and three in eight married Negro veterans in the Fort Worth area were doubling up with relatives or friends or were living in rented rooms, trailers, or tourist cabins according to the results of a sample survey released today by Director J.C.Capt, Bureau of the Census. The survey, made during September at the request of the National Housing Agency for the Veterans Emergency Housing Program, further showed that one-sixth of the married white veterans and about one-half of the married Negro veterans lived in dwelling units which needed major repairs or lacked one or more standard plumbing facilities--running water, private flush toilet, and private bath.

Of the estimated 18,000 World War II veterans living in the Fort Worth area at the time of the survey, 16,000 were white and 2,000 were Negro. Two-thirds of the white veterans were married and one-third were single, widowed, or divorced. Among the Negro veterans, three-fifths were married and two-fifths were single.

The survey also inquired into the housing plans of all the veterans for the next 12 months. When asked what they would do if housing would be available during the next year only at present prices and quality, 17 percent of the white veterans said they would be in the housing market--10 percent would buy or build a house and 7 percent would move and rent. Of the Negro veterans, 21 percent would be in the housing market--17 percent would buy or build and 4 percent would move and rent.

An additional 13 percent of the white veterans and 9 percent of the Negro veterans would be drawn into the housing market if they could find houses at the price, size, and quality they desire. Under such conditions, a total of 26 percent of the white veterans and 25 percent of the Negro veterans would buy or build a house within the next 12 months; and 4 percent of the white and 5 percent of the Negro veterans would move and rent.

VETERANS' HOUSING PLANS FOR THE NEXT 12 MONTHS

Of those who plan to buy or build in the present market, the white veterans indicated they are able to pay an average (median) price of $5,800 and Negro veterans reported they are able to pay $3,200.

Among the white veterans who would buy or build if houses are available at the price and quality they desire, the average (median)price they reported they would be able to pay for a house was $5,700 and the average (median) gross monthly payment they would be able to make, including payments for real estate taxes, fire insurance, heat, light, and cooking fuel, was $47. Their average (median) weekly income from all sources was $52. The average size house they desired was five rooms. About one-half of the Negro veterans who would buy or build under these conditions reported they could pay less than $3,000 and about one-fifth could pay $4,000 or more. The average monthly payment they could make was $30, and their average weekly income was $33. The average size house Negro veterans desired was four rooms.

Among all veterans who would move and rent other quarters if they could get what they wanted, the average gross monthly rental they reported they would be able to pay was $46, their average weekly income was $45, and the average size unit they desired was four rooms.

36016

GENERAL CHARACTERISTICS OF VETERANS

Of the estimated 18,000 veterans living in the Fort Worth area at the time of the survey, nearly one-fourth (24 percent) were newcomers to the locality since they entered the service. The proportion of in-migrants for married white veterans was considerably higher than the proportion for single white veterans. The proportion of in-migrants was slightly higher for single than for married Negro veterans. (See Table 1 on page 5.)

Nine-tenths (90 percent) of the married white veterans and over six-tenths (62 percent) of the single white veterans were employed. Of the Negro veterans, 83 percent of the married and 66 percent of the single were employed. Veterans in the "other than employed" group included those who did not desire work at the time of the survey as well as those who were seeking employment. About one-half of all the veterans who were not working had been discharged since December 31, 1945.

For all veterans, the average (median) weekly income from all sources was $43. Income for white veterans averaged $51 for the married as compared with $32 for the single. Among the Negro veterans there was less difference—$31 for the married and $28 for the single. (Average income was based on all veterans, including those who reported having no income.)

PRESENT LIVING ARRANGEMENTS OF VETERANS

Hardship among veterans was partly reflected by the extent to which they were doubling up with relatives or friends or were living in rented rooms, trailers, or tourist cabins. One-fourth (26 percent) of the married white veterans and three-tenths (31 percent) of the married Negro veterans were doubling up in ordinary dwelling units, that is, were living in units which contained, in addition to the head of the household, one or more married couples or married women whose husbands were living elsewhere. Twenty percent of the single white veterans as compared with six percent of the married white veterans were living in rented rooms, trailers, or tourist cabins. For the Negro veterans, these proportions were 21 percent for the single and 6 percent for the married. (See table 2 on page 5.)

Exclusive of those living in rented rooms, about one-eighth of the total white veterans and nearly one-half of the total Negro veterans lived in dwelling units which were in need of major repairs or lacked one or more standard plumbing facilities.

One-third (34 percent) of the married white and one-fifth (19 percent) of the married Negro veterans owned their homes. (See table 2 on page 5.) One-third of the married white and about one-fourth of the married Negro owners purchased their homes after they were discharged. Two-fifths (39 percent) of the married white veterans and one-half (50 percent) of the married Negro veterans were renting dwelling units in their names at the time of the survey and were paying an average (median) gross monthly rent of $39 and $20 respectively. Seven-tenths of the white veterans and about six-tenths of the Negro veterans who were renting acquired their units after they were discharged.

HOUSING PLANS OF VETERANS

Nine-tenths (89 percent) of the total veterans plan to remain in the Fort Worth locality for the coming year. Five percent of the veterans plan to leave the locality and six percent are undecided in their plans. (See table 3 on page 6.)

If housing is available during the year only at present prices and quality, 10 out of every 100 white veterans plan to buy or build in the locality, 7 plan to move and rent, 69 plan to remain in their present quarters, and the remaining 14 plan to move into rented rooms or double up, leave the area, or are undecided. Out of every 100 Negro veterans, 17 plan to buy or build, 4 plan to move and rent, 68 plan to remain in their present quarters, and the remaining 11 have other plans.

However, if the veterans could find what they want, 26 out of every 100 white veterans would buy or build a house, 4 would move and rent, and only 56 would remain in their present quarters during the coming year. If the Negro veterans could find what they want, 25 out of every 100 would buy or build a house, 5 would move and rent, and 59 would remain in their present quarters. (See table 5 on page 6.)

360/6

For the white veterans who would buy or build if they could find what they want, the average (median) price house they said they could afford was $5,700 and one-fourth of the veterans could pay only $4,600 or even less. About one-half of the Negro veterans desiring to buy or build reported they could afford to pay less than $3,000 and one-fifth could pay $4,000 or more. Almost three-fifths of the white veterans preferred five-room houses and seven-tenths of the Negro veterans preferred four- or five-room houses. About three-fifths of the white veterans and almost one-half of the Negro veterans who would buy or build a house have taken some action toward buying or building or have saved money specifically for a house.

Practically all of the prospective home owners would purchase through monthly payments. The gross monthly payments they reported they would be able to make, including real estate taxes, fire insurance, heat, light, and cooking fuel, averaged $47 for white veterans and $30 for Negro veterans. However, one-fourth of the white veterans planning to buy or build reported they could pay only $40 or less and one-fourth of the Negro veterans could pay only $25 or less.

For the white veterans who would move and rent if they could find what they want, the average (median) gross monthly rental they reported they would be able to pay, including payments for heat, light, and cooking fuel, was $48. One-fourth of the veterans could afford only $39 or less. Of the Negro veterans who would move and rent if they could find what they want, three-fifths reported they are able to pay less than $20 monthly. Units in single-family structures were preferred by seven-tenths of all the veterans who would like to rent.

AVAILABILITY AND CHARACTERISTICS OF PRESENT HOUSING

In conjunction with the survey of veterans to determine their general characteristics, present living arrangements and housing plans, information on occupancy and vacancy in dwelling units was collected. Tables 6, 7, and 8 on the following pages summarize the availability and characteristics of vacant dwelling units and tenure, rent, facilities, and doubling-up in occupied dwelling units.

The survey showed that 1.2 percent of all the dwelling units in the Fort Worth area including privately and publicly financed dwelling units, were unoccupied. The gross vacancy rate for privately financed dwelling units alone was the same, 1.2 percent. Among private units in white neighborhoods, the gross vacancy rate was 1.1 percent and among those in Negro neighborhoods, 1.8 percent. These rates indicate a substantial increase in the number of unoccupied units in the area since February 1945, when a similar survey showed gross vacancy rates of 0.4 percent in white and 1.0 percent in Negro sections. (The 1945 survey excluded Arlington city which is a small part of the total area.)

According to the recent survey nine-tenths of the private vacancies were habitable; of these, approximately three-eighths lacked installed cooking facilities. About one-half of the habitable vacancies were being offered for rent or sale and the remainder were either already rented or sold or were being held off the rental or sale market for other reasons.

Seven-tenths (70 percent) of the habitable vacancies were built before 1930, about two-fifths (38 percent) had been vacant one month or longer, three-tenths (29 percent) lacked one or more standard plumbing facilities, and the average size was four rooms.

About one-third of the habitable vacancies were rental units for which the average (median) monthly rental asked was $27 and the average size was three rooms. One-half (51 percent) of the habitable rental vacancies lacked one or more standard plumbing facilities, and three-tenths (31 percent) had been vacant one month or longer.

The survey further showed that 22 percent of the privately financed dwelling units in which white veterans lived contained doubled-up families as compared with 9 percent for all private units occupied by white families. For Negroes the proportions were 25 percent and 10 percent, respectively. (See table 7 on page 7.) Practically all of the veteran-occupied units with doubled-up families contained one or more married couples in addition to the head of the household while very few contained only married women in addition to the head.

360166

About three-fifths (62.8 percent) of all the private dwelling units in the Fort Worth area were occupied by their owners and less than two-fifths (36.0 percent) were occupied by tenants. The average (median) monthly contract rent was $36 for private units occupied by white tenants and $15 for those occupied by Negro tenants. Among the tenant units containing one or more veterans, the average monthly rentals were the same—$36 for units occupied by white families and $15 for those occupied by Negroes. These units were rented by the heads of the households and not necessarily by the veterans themselves. (See tables 6 and 7 on page 7.)

The proportions of owner-occupied and tenant-occupied dwelling units in September 1946 represent a considerable shift from tenant-occupancy to owner-occupancy since April 1940 when a complete enumeration in the Census of Housing showed that 40.6 percent of all the dwelling units in the area were occupied by their owners and 54.2 percent were occupied by tenants.

TECHNICAL NOTE

The findings presented in this report are based on a sample survey in Fort Worth and Arlington. For dwelling unit occupancy and vacancy characteristics, approximately 6,400 dwelling units were enumerated to represent all sections of the area and all types of residential structures except institutions, publicly financed housing projects, transient hotels, commercial rooming houses, trailers, and tourist cabins. For information on veterans' housing characteristics and intentions, the enumeration was extended to include veterans in all types of residential structures except institutions and transient hotels. Occupancy and vacancy data for publicly financed housing for the Fort Worth locality were obtained from reports of the National Housing Agency as of the end of August.

The number of privately financed dwelling units shown in this report for the Fort Worth area is an estimate based on the weighted sample results and the 1940 census data plus building permit records. The number of World War II veterans shown in this report is an estimate of the number of veterans in the locality exclusive of those in institutions and hotels. This figure was based on the weighted sample results and on an independent estimate derived from the distribution of veterans by state of preservice residence and the proportion of 1-C Selective Service registrants in the locality. This estimate is only a rough approximation but is the best that can be made from the limited information available.

An examination of the results shows that this survey, like practically all others based upon a field canvass of a cross-section of the population, did not cover a proportionate share of the most mobile parts of the population, e.g., veterans who were traveling about preparatory to taking a job and establishing a residence. In addition, some persons who were actually veterans were not identified as such because of inaccurate or inadequate information furnished by the respondents. The characteristics of such groups may not be the same as those of the enumerated veterans, but in the absence of information concerning these characteristics no adjustment has been made in the results of the survey because of this factor.

The figures presented in this report may differ somewhat from the results which would have been obtained by a complete census because of sampling variability. The following are examples of the magnitude of the sampling variations and the probability of their occurrence for three of the more significant statistics quoted in this report. For the 25 percent of the total veterans who would like to buy or build a house, the chances are two out of three that the rate which would have been obtained by a complete census is between 23 percent and 27 percent. For the 26 percent of the married white veterans who were living doubled up, the chances are two out of three that the rate which would have been obtained by a complete census is between 24 percent and 28 percent; and for the 31 percent of the married Negro veterans who were living doubled up, the chances are two out of three that the rate would have been between 27 percent and 35 percent. Since the sampling variability of any percentage depends not only on the value of the percent, but also on the size of the base on which the percentage is determined, the variations shown in the examples should not be applied indiscriminately to all percentages quoted in this report.

In addition to sampling variability, the estimates are subject to errors of response. Such errors may be expected to affect the sample estimates to about the same degree as they would affect the results of a complete census.

December 10, 1946 DEPARTMENT OF COMMERCE Bureau of the Census Population: HVet-No. 74

Survey of World War II Veterans and Dwelling Unit Vacancy and Occupancy in Jackson, Miss.

Approximately one-half of the married white World War II veterans and one-half of the married Negro veterans in Jackson were doubling up with relatives or friends or were living in rented rooms, trailers, or tourist cabins according to the results of a sample survey released today by Director J.C.Capt, Bureau of the Census. The survey, made during late July at the request of the National Housing Agency for the Veterans Emergency Housing Program, further showed that four percent of the married white veterans and forty-three percent of the married Negro veterans lived in dwelling units which needed major repairs or lacked one or more standard plumbing facilities—running water, private flush toilet, and private bath.

Of the estimated 6,000 World War II veterans living in Jackson at the time of the survey, 4,500 were white and 1,500 were Negro. Two-thirds of the white veterans were married and one-third were single, widowed, or divorced. Among the Negro veterans, the proportions of married and single were about the same as among the white veterans.

The survey also inquired into the housing plans of all the veterans for the next 12 months. When asked what they would do if housing would be available during the next year only at present prices and quality, 15 percent of the white veterans said they would be in the housing market—8 percent would buy or build a house and 7 percent would move and rent. Of the Negro veterans, 17 percent would be in the housing market—12 percent would buy or build and 5 percent would move and rent.

An additional 17 percent of the white veterans and 20 percent of the Negro veterans would be drawn into the housing market if they could find houses at the price, size, and quality they desire. Under such conditions, a total of 28 percent of the white veterans and 34 percent of the Negro veterans would buy or build a house within the next 12 months; and 4 percent of the white and 3 percent of the Negro veterans would move and rent.

VETERANS' HOUSING PLANS FOR THE NEXT 12 MONTHS

Of those who plan to buy or build in the present market, the white veterans indicated they are able to pay an average (median) price of $6,600 and three-fifths of the Negro veterans reported they are able to pay $3,000 or less.

Among the white veterans who would buy or build if houses are available at the price and quality they desire, the average (median) price they reported they would be able to pay for a house was $6,000 and the average (median) gross monthly payment they would be able to make, including payments for real estate taxes, fire insurance, heat, light, and cooking fuel, was $44. Their average (median) weekly income from all sources was $51. The average size house they desired was four rooms. Negro veterans who would buy or build under these conditions reported an average price of $3,200, an average monthly payment of $27, and an average weekly income of $30. The average size house Negro veterans desired was five rooms.

Among all of the veterans who would move and rent other quarters if they could get what they wanted, the average gross monthly rental they reported they would be able to pay was $39, their average weekly income was $42, and the average size unit they desired was four rooms.

36115

GENERAL CHARACTERISTICS OF VETERANS

Of the estimated 6,000 veterans living in Jackson at the time of the survey, one-fourth (25 percent) were newcomers to the locality since they entered the service. The proportion of in-migrants for white veterans was considerably higher than the proportion for Negro veterans. (See table 1 on page 5.)

More than nine-tenths (94 percent) of the married white veterans and over six-tenths (62 percent) of the single white veterans were employed. Of the Negro veterans, 87 percent of the married and 69 percent of the single were employed. Veterans in the "other than employed" group included those who did not desire work at the time of the survey as well as those who were seeking employment. About three-fifths of all the veterans who were not working had been discharged since December 31, 1945.

For all veterans, the average (median) weekly income from all sources was $41. Income for white veterans averaged $53 for the married as compared with $28 for the single. Among the Negro veterans there was less difference—$29 for the married and $23 for the single. (Average income was based on all veterans including those who reported having no income.)

PRESENT LIVING ARRANGEMENTS OF VETERANS

Hardship among veterans was partly reflected by the extent to which they were doubling up with relatives or friends or were living in rented rooms, trailers, or tourist cabins. About one-fourth (26 percent) of the married white veterans and one-seventh (15 percent) of the married Negro veterans were doubling up in ordinary dwelling units, that is, were living in units which contained, in addition to the head of the household, one or more married couples or married women whose husbands were living elsewhere. Twenty-seven percent of the single white veterans and 26 percent of the married white veterans were living in rented rooms, trailers, or tourist cabins. For the Negro veterans, these proportions were 46 percent for the single and 37 percent for the married. (See table 2 on page 5.)

Exclusive of those living in rented rooms, about three percent of the total white veterans and 42 percent of the total Negro veterans lived in dwelling units which were in need of major repairs or lacked one or more standard plumbing facilities.

Over one-fourth (27 percent) of the married white and one-eighth (12 percent) of the married Negro veterans owned their homes. (See table 2 on page 5.) Approximately three-fifths of the white and two-fifths of the Negro owners purchased their homes after they were discharged. Three-tenths (29 percent) of the married white veterans and four-tenths (39 percent) of the married Negro veterans were renting dwelling units in their names at the time of the survey and were paying an average (median) gross monthly rent of $40 and $19 respectively. Seven-tenths of the white veterans and about one-half of the Negro veterans who were renting acquired their units after they were discharged.

HOUSING PLANS OF VETERANS

More than nine-tenths (95 percent) of the total veterans plan to remain in the Jackson locality for the coming year. Three percent of the veterans plan to leave the locality and two percent are undecided in their plans. (See table 3 on page 6.)

If housing is available during the year only at present prices and quality, 8 out of every 100 white veterans plan to buy or build in the locality, 7 plan to move and rent, 77 plan to remain in their present quarters, and the remaining 8 plan to move into rented rooms or double up, leave the area, or are undecided. Out of every 100 Negro veterans, 12 plan to buy or build, 5 plan to move and rent, 72 plan to remain in their present quarters, and the remaining 11 have other plans.

However, if the veterans could find what they want, 28 out of every 100 white veterans would buy or build a house, 4 would move and rent, and only 61 would remain in their present quarters during the coming year. If the Negro veterans could find what they want, 34 out of every 100 would buy or build a house, 3 would move and rent, and 53 would remain in their present quarters. (See table 5 on page 6.)

December ~~12~~ 16, 1946

DEPARTMENT OF COMMERCE
Bureau of the Census

Population: HVet-No. 75

Survey of World War II Veterans and Dwelling Unit Vacancy and Occupancy in the Atlanta Area, Georgia

Approximately one-half of the married white World War II veterans and about the same proportion of the married Negro veterans in the Atlanta area were doubling up with relatives or friends or were living in rented rooms, trailers, or tourist cabins according to the results of a sample survey released today by Director J. C. Capt, Bureau of the Census. The survey, made during July at the request of the National Housing Agency for the Veterans Emergency Housing Program, further showed that one-tenth of the married white veterans and one-half of the married Negro veterans lived in dwelling units which needed major repairs or lacked one or more standard plumbing facilities--running water, private flush toilet, and private bath.

Of the estimated 40,000 World War II veterans living in the Atlanta area at the time of the survey, 30,500 were white and 9,500 were Negro. Seven-tenths of the white veterans were married and three-tenths were single, widowed, or divorced. Among the Negro veterans, approximately five out of eight were married.

The survey also inquired into the housing plans of all the veterans for the next 12 months. When asked what they would do if housing would be available during the next year only at present prices and quality, 26 percent of the white veterans said they would be in the housing market--15 percent would buy or build a house and 11 percent would move and rent. Of the Negro veterans, 49 percent would be in the housing market--31 percent would buy or build and 18 percent would move and rent.

An additional 19 percent of the white veterans and 13 percent of the Negro veterans would be drawn into the housing market if they could find houses at the price, size, and quality they desire. Under such conditions, a total of 38 percent of the white veterans and 52 percent of the Negro veterans would buy or build a house within the next 12 months; and 7 percent of the white and 10 percent of the Negro veterans would move and rent.

VETERANS' HOUSING PLANS FOR THE NEXT 12 MONTHS

Of those who plan to buy or build in the present market, the white veterans indicated they are able to pay an average (median) price of $6,300 and Negro veterans reported they are able to pay $3,800.

Among the white veterans who would buy or build if houses are available at the price and quality they desire, the average (median) price they reported they would be able to pay for a house was $6,200 and the average (median) gross monthly payment they would be able to make, including payments for real estate taxes, fire insurance, heat, light, and cooking fuel, was $46. Their average (median) weekly income from all sources was $50. The average size house they desired was five rooms. Negro veterans who would buy or build under these conditions reported an average price of $3,800, an average monthly payment of $31, and an average weekly income of $32. The average size house Negro veterans desired was five rooms.

Among all the veterans who would move and rent other quarters if they could get what they wanted, the average gross monthly rental they reported they would be able to pay was $35, their average weekly income was $38, and the average size unit they desired was four rooms.

36 288

GENERAL CHARACTERISTICS OF VETERANS

Of the estimated 40,000 veterans living in the Atlanta area at the time of the survey, one-fifth (19 percent) were newcomers to the locality since they entered the service. The proportion of in-migrants for white veterans was considerably larger than the proportion for Negro veterans. (See table 1 on page 5.)

Seven-eighths (86 percent) of the married white veterans and two-thirds (66 percent) of the single white veterans were employed. Of the Negro veterans, 83 percent of the married and 66 percent of the single were employed. Veterans in the "other than employed" group included those who did not desire work at the time of the survey as well as those who were seeking employment. Almost one-half of all the veterans who were not working had been discharged since December 31, 1945.

For all veterans, the average (median) weekly income from all sources was $40. Income for white veterans averaged $52 for the married as compared with $32 for the single. Among the Negro veterans there was less difference—$31 for the married and $27 for the single. (Average income was based on all veterans, including those who reported having no income.)

PRESENT LIVING ARRANGEMENTS OF VETERANS

Hardship among veterans was partly reflected by the extent to which they were doubling up with relatives or friends or were living in rented rooms, trailers, or tourist cabins. More than one-fourth (28 percent) of the married white veterans and over one-third (36 percent) of the married Negro veterans were doubling up in ordinary dwelling units, that is, were living in units which contained, in addition to the head of the household, one or more married couples or married women whose husbands were living elsewhere. Twenty-six percent of the single white veterans as compared with 19 percent of the married white veterans were living in rented rooms, trailers, or tourist cabins. For the Negro veterans, these proportions were 28 percent for the single and 12 percent for the married. (See table 2 on page 5.)

Exclusive of those living in rented rooms, one-tenth of the total white veterans and one-half of the total Negro veterans lived in dwelling units which were in need of major repairs or lacked one or more standard plumbing facilities.

One-fifth (21 percent) of the married white and almost one-tenth (8 percent) of the married Negro veterans owned their homes. (See table 2 on page 5.) Nearly two-fifths of the married white and one-tenth of the married Negro owners purchased their homes after they were discharged. One-third (34 percent) of the married white veterans and more than two-fifths (42 percent) of the married Negro veterans were renting dwelling units in their names at the time of the survey and were paying an average (median) gross monthly rent of $39 and $18 respectively. One-half of the married white veterans and one-third of the married Negro veterans who were renting acquired their units after they were discharged.

HOUSING PLANS OF VETERANS

Approximately nine-tenths (92 percent) of the total veterans plan to remain in the Atlanta locality for the coming year. Three percent of the veterans plan to leave the locality and five percent are undecided in their plans. (See table 3 on page 6.)

If housing is available during the year only at present prices and quality, 15 out of every 100 white veterans plan to buy or build in the locality, 11 plan to move and rent, 64 plan to remain in their present quarters, and the remaining 10 plan to move into rented rooms or double up, leave the area, or are undecided. Out of every 100 Negro veterans, 31 plan to buy or build, 18 plan to move and rent, 40 plan to remain in their present quarters, and the remaining 11 have other plans.

However, if the veterans could find what they want, 38 out of every 100 white veterans would buy or build a house, 7 would move and rent, and only 46 would remain in their present quarters during the coming year. If the Negro veterans could find what they want, 52 out of every 100 would buy or build a house, 10 would move and rent, and 27 would remain in their present quarters. (See table 5 on page 6.)

36288

For the white veterans who would buy or build if they could find what they want, the average (median) price house they said they could afford was $6,200 and one-fourth of the veterans could pay only $5,000 or even less. Negro veterans desiring to buy or build reported they could afford to pay an average price of $3,800 with one-fourth able to pay only $3,000 or even less. (See table 4 on page 6.) One-half of the white veterans and two-fifths of the Negro veterans preferred five-room houses. About three-fifths of the white veterans and two-fifths of the Negro veterans who would buy or build a house have taken some action toward buying or building or have saved money specifically for a house.

Practically all of the prospective home owners would purchase through monthly payments. The gross monthly payments they reported they would be able to make, including real estate taxes, fire insurance, heat, light, and cooking fuel, averaged $46 for white veterans and $31 for Negro veterans. However, one-fourth of the white veterans planning to buy or build reported they could pay only $37 or less and one-fourth of the Negro veterans could pay only $25 or less.

For the white veterans who would move and rent if they could find what they want, the average (median) gross monthly rental they reported they would be able to pay, including payments for heat, light, and cooking fuel, was $46. One-fourth of these veterans could afford only $33 or less. Of the Negro veterans who would move and rent if they could find what they want, three-fourths reported they could pay $20 or less monthly. Units in single-family structures were preferred by two-thirds of all the veterans who would like to rent.

AVAILABILITY AND CHARACTERISTICS OF PRESENT HOUSING

In conjunction with the survey of veterans to determine their general characteristics, present living arrangements and housing plans, information on occupancy and vacancy in dwelling units was collected. Tables 6, 7, and 8 on the following pages summarize the availability and characteristics of vacant dwelling units and tenure, rent, facilities, and doubling-up in occupied dwelling units.

The survey showed that 1.2 percent of all the dwelling units in the Atlanta area, including privately and publicly financed dwelling units, were unoccupied. The gross vacancy rate for privately financed dwelling units alone was 1.3 percent—in white neighborhoods, 1.7 percent, and in Negro neighborhoods, 0.4 percent.

Separate analysis for Atlanta city alone showed a gross vacancy rate of 0.9 percent, indicating an increase in the number of unoccupied dwelling units since March 1945. At that time, a survey of the city made by the Bureau of Labor Statistics showed a gross vacancy rate of 0.4 percent.

According to the recent survey, approximately one-half of the private vacancies in the area were habitable; of these, about one-third lacked installed cooking facilities. One-third of the habitable vacancies were being offered for rent or sale and the remainder were either already rented or sold or were being held off the rental or sale market for other reasons.

In Atlanta city, approximately four-fifths of the private vacancies were habitable; of these, about one-third lacked installed cooking facilities. Three-tenths of the habitable vacancies were being offered for rent or sale.

In the area, nearly one-half (45 percent) of the habitable vacancies were built before 1930, one-sixth (17 percent) lacked one or more standard plumbing facilities, two-thirds (68 percent) were units in single-family structures without business, and the average size was five rooms.

The survey further showed that 28 percent of the privately financed dwelling units in which white veterans lived contained doubled-up families as compared with 13 percent for all private units occupied by white families. For Negroes the proportions were 33 percent and 15 percent respectively. (See table 7 on page 9.) Practically all of the veteran-occupied units with doubled-up families contained one or more married couples in addition to the head of the household while very few contained only married women in addition to the head.

36288

Nearly one-half (45.2 percent) of all the private dwelling units in the Atlanta area were occupied by their owners and slightly more than one-half (53.5 percent) were occupied by tenants. The average (median) monthly contract rent was $34 for private units occupied by white tenants and $12 for those occupied by Negro tenants. (See tables 6 and 7 on page 9.) Among the tenant units containing one or more veterans, the average monthly rental was $32 for units occupied by white families and $14 for those occupied by Negroes. These units were rented by the heads of the households and not necessarily by the veterans themselves.

The proportions of owner-occupied and tenant-occupied dwelling units in July 1946 represent a substantial shift from tenant-occupancy to owner-occupancy since April 1940 when a complete enumeration in the Census of Housing showed that 28.4 percent of all the dwelling units in the area were occupied by their owners and 68.4 percent were occupied by tenants.

Separate figures for Atlanta city are shown in the tables on pages 7, 8, 9, and 10. In general, they differ only slightly from the figures for the entire area.

TECHNICAL NOTE

The findings presented in this report are based on a sample survey in Atlanta city, Hapeville city, College Park city, Decatur city, East Point city and Buckhead. For dwelling unit occupancy and vacancy characteristics, approximately 5,600 dwelling units were enumerated to represent all sections of the area and all types of residential structures except institutions, publicly financed housing projects, transient hotels, commercial rooming houses, trailers, and tourist cabins. For information on veterans' housing characteristics and intentions, the enumeration was extended to include veterans in all types of residential structures except institutions and transient hotels. Occupancy and vacancy data for publicly financed housing for the Atlanta locality were obtained from reports of the National Housing Agency as of the end of June.

Because the percentages in this report are based on data obtained from a sample of dwelling units and veterans, they may vary somewhat from the results which would have been obtained from a complete census of the area. The following are examples of the magnitude of the sampling variations and the probability of their occurrence for three of the more significant statistics quoted in this report. For the 41 percent of the total veterans in the area who would buy or build a house, the chances are two out of three that the rate which would have been obtained by a complete census is between 38 percent and 44 percent. For the 28 percent of the married white veterans in the area who were living doubled-up the chances are two out of three that the rate which would have been obtained by a complete census is between 25 percent and 31 percent; and for the 36 percent of the married Negro veterans who were living doubled up, the chances are two out of three that the rate would have been between 31 percent and 41 percent. For the 47 percent of the total veterans in the city who would like to buy or build a house, the chances are two out of three that the rate which would have been obtained by a complete census is between 45 percent and 49 percent. Since the sampling variability of any percentage depends not only on the value of the percent, but also on the size of the base on which the percentage is determined, the variations shown in the examples should not be applied indiscriminately to all percentages quoted in this report.

In addition to sampling variability, the estimates are subject to errors of response. Such errors may be expected to affect the sample estimates to about the same degree as they would affect the results of a complete census.

The number of World War II veterans shown in this report is an estimate of the number of veterans in the locality exclusive of those in institutions and hotels. This figure was based on the weighted sample results and on an independent estimate derived from the distribution of veterans by state of preservice residence and the proportion of 1-C Selective Service registrants in the locality. This estimate is only a rough approximation but is the best that can be made from the limited information available.

The number of privately financed dwelling units in the area is an estimate based on the weighted sample results and the 1940 census data plus building permit records.

December 16, 1946 DEPARTMENT OF COMMERCE Bureau of the Census Population: HVet-No. 76

Survey of World War II Veterans and Dwelling Unit Vacancy and Occupancy in the New Orleans Area, Louisiana

Approximately one-third of the married white World War II veterans and almost one-half of the married Negro veterans in the New Orleans area were doubling up with relatives or friends or were living in rented rooms, trailers, or tourist cabins according to the results of a sample survey released today by Director J. C. Capt, Bureau of the Census. The survey, made during August at the request of the National Housing Agency for the Veterans Emergency Housing Program, further showed that one-twelfth of the married white veterans and one-half of the married Negro veterans lived in dwelling units which needed major repairs or lacked one or more standard plumbing facilities--running water, private flush toilet, and private bath.

Of the estimated 50,000 World War II veterans living in the New Orleans area at the time of the survey, 36,000 were white and 14,000 were Negro. Five-ninths of the white veterans were married and four-ninths were single, widowed, or divorced. Among the Negro veterans, the proportions of married and single were about the same as among the white veterans.

The survey also inquired into the housing plans of all the veterans for the next 12 months. When asked what they would do if housing would be available during the next year only at present prices and quality, 14 percent of the white veterans said they would be in the housing market—7 percent would buy or build a house and 7 percent would move and rent. Of the Negro veterans, 31 percent would be in the housing market—14 percent would buy or build and 17 percent would move and rent.

An additional 15 percent of the white veterans and 11 percent of the Negro veterans would be drawn into the housing market if they could find houses at the price, size, and quality they desire. Under such conditions, a total of 22 percent of the white veterans and 24 percent of the Negro veterans would buy or build a house within the next 12 months; and 7 percent of the white and 18 percent of the Negro veterans would move and rent.

VETERANS' HOUSING PLANS FOR THE NEXT 12 MONTHS

Of those who plan to buy or build in the present market, the white veterans indicated they are able to pay an average (median) price of $6,000 and seven-tenths of the Negro veterans reported they are able to pay $3,000 or less.

Among the white veterans who would buy or build if houses are available at the price and quality they desire, the average (median) price they reported they would be able to pay for a house was $6,000 and the average (median) gross monthly payment they would be able to make, including payments for real estate taxes, fire insurance, heat, light, and cooking fuel, was $46. Their average (median) weekly income from all sources was $47. The average size house they desired was five rooms. Negro veterans who would buy or build under these conditions reported an average price of $3,000, an average monthly payment of $30, and an average weekly income of $29. The average size house Negro veterans desired was four rooms.

Among the white veterans who would move and rent other quarters if they could get what they wanted, the average gross monthly rental they reported they would be able to pay was $32, their average weekly income was $43, and the average size unit they desired was four rooms. For Negro veterans who would move and rent, the average monthly rental reported was $20, their average weekly income was $28, and the average size unit they desired was three rooms.

36441

GENERAL CHARACTERISTICS OF VETERANS

Of the estimated 50,000 veterans living in the New Orleans area at the time of the survey, one-eighth (12 percent) were newcomers to the locality since they entered the service. The proportion of in-migrants for Negro veterans was considerably higher than the proportion for white veterans. (See table 1 on page 5.)

Nearly nine-tenths (88 percent) of the married white veterans and over six-tenths (62 percent) of the single white veterans were employed. Of the Negro veterans, 73 percent of the married and 61 percent of the single were employed. Veterans in the "other than employed" group included those who did not desire work at the time of the survey as well as those who were seeking employment. One-half of all the veterans who were not working had been discharged since December 31, 1945.

For all veterans, the average (median) weekly income from all sources was $34. Income for white veterans averaged $47 for the married as compared with $28 for the single. Among the Negro veterans there was little difference—$29 for the married and $27 for the single. (Average income was based on all veterans, including those who reported having no income.)

PRESENT LIVING ARRANGEMENTS OF VETERANS

Hardship among veterans was partly reflected by the extent to which they were doubling up with relatives or friends or were living in rented rooms, trailers, or tourist cabins. One-fourth (24 percent) of the married white veterans and a slightly higher proportion (28 percent) of the married Negro veterans were doubling up in ordinary dwelling units, that is, were living in units which contained, in addition to the head of the household, one or more married couples or married women whose husbands were living elsewhere. Eighteen percent of the single white veterans as compared with eight percent of the married white veterans were living in rented rooms, trailers, or tourist cabins. For the Negro veterans, these proportions were 25 percent for the single and 17 percent for the married. (See table 2 on page 5.)

Exclusive of those living in rented rooms, about 7 percent of the total white veterans and 46 percent of the total Negro veterans lived in dwelling units which were in need of major repairs or lacked one or more standard plumbing facilities.

Thirteen percent of the married white and seven percent of the married Negro veterans owned their homes. (See table 2 on page 5.) About three-fifths of the married white and one-half of the married Negro owners purchased their homes after they were discharged. Almost three-fifths (57 percent) of the married white veterans and over one-half (53 percent) of the married Negro veterans were renting dwelling units in their names at the time of the survey and were paying an average (median) gross monthly rent of $35 and $17, respectively. About one-half of the white veterans and three-tenths of the Negro veterans who were renting acquired their units after they were discharged.

HOUSING PLANS OF VETERANS

Practically all (96 percent) of the veterans plan to remain in the New Orleans locality for the coming year. Only two percent of the veterans plan to leave the locality and two percent are undecided in their plans. (See table 3 on page 6.)

If housing is available during the year only at present prices and quality, 7 out of every 100 white veterans plan to buy or build in the locality, 7 plan to move and rent, 80 plan to remain in their present quarters, and the remaining 6 plan to move into rented rooms or double up, leave the area, or are undecided. Out of every 100 Negro veterans, 14 plan to buy or build, 17 plan to move and rent, 63 plan to remain in their present quarters, and the remaining 6 have other plans.

However, if the veterans could find what they want, 22 out of every 100 white veterans would buy or build a house, 7 would move and rent, and only 65 would remain in their present quarters during the coming year. If the Negro veterans could find what they want, 24 out of every 100 would buy or build a house, 18 would move and rent, and 53 would remain in their present quarters. (See table 5 on page 6.)

36441

For the white veterans who would buy or build if they could find what they want, the average (median) price house they said they could afford was $6,000 and one-fourth of the veterans could pay only $5,000 or even less. Negro veterans desiring to buy or build reported they could afford to pay an average price of $3,000 with one-fourth able to pay only $2,000 or even less. About seven-tenths of the white and seven-tenths of the Negro veterans preferred four- or five-room houses. Three-fifths of the white veterans and two-fifths of the Negro veterans who would buy or build a house have taken some action toward buying or building or have saved money specifically for a house.

Practically all of the prospective home owners would purchase through monthly payments. The gross monthly payments they reported they would be able to make, including real estate taxes, fire insurance, heat, light, and cooking fuel, averaged $46 for white veterans and $30 for Negro veterans. However, one-fourth of the white veterans planning to buy or build reported they could pay only $36 or less and one-fourth of the Negro veterans could pay only $24 or less.

For the veterans who would move and rent if they could find what they want, the average (median) gross monthly rental they reported they would be able to pay, including payments for heat, light, and cooking fuel, was $32 for white and $20 for Negro veterans. Units in single-family structures were preferred by two-thirds of the white veterans who would like to rent, while three-fourths of the Negro veterans preferred units in multi-family structures.

AVAILABILITY AND CHARACTERISTICS OF PRESENT HOUSING

In conjunction with the survey of veterans to determine their general characteristics, present living arrangements and housing plans, information on occupancy and vacancy in dwelling units was collected. Tables 6, 7, and 8 on the following pages summarize the availability and characteristics of vacant dwelling units and tenure, rent, facilities, and doubling-up in occupied dwelling units.

The survey showed that 1.7 percent of all the dwelling units in the New Orleans area including privately and publicly financed dwelling units, were unoccupied. The gross vacancy rate for privately financed dwelling units alone was 1.8 percent, indicating an increase in the number of unoccupied private units since July 1945, when a similar survey made by the Bureau of Labor Statistics showed a gross vacancy rate of 0.9 percent.

Approximately one-fourth of the unoccupied private units were seasonal vacancies and the remaining three-fourths were non-seasonal. The proportion of non-seasonal private vacancies for white occupancy was considerably higher than the proportion for Negro occupancy--1.7 percent for the white and 0.5 percent for the Negro.

According to the recent survey about nine-tenths of the non-seasonal private vacancies were habitable; of these, about one-third were being offered for rent or sale and the remainder were either already rented or sold or were being held off the rental or sale market for other reasons.

More than one-half (53 percent) of the habitable non-seasonal vacancies were built before 1920. Almost one-half (47 percent) had been vacant one month or longer. About three-fifths (57 percent) were units in single-family structures without business, and the average size was four rooms.

The survey further showed that 21 percent of the privately financed dwelling units in which white veterans lived contained doubled-up families as compared with 14 percent for all private units occupied by white families. For Negroes, the proportions were 30 percent and 15 percent respectively. (See table 7 on page 7.) Seven-tenths of the veteran-occupied units with doubled-up families contained one or more married couples in addition to the head of the household while three-tenths contained only married women in addition to the head.

About one-third (32.7 percent) of all the private dwelling units in the New Orleans area were occupied by their owners and nearly two-thirds (65.5 percent) were occupied by tenants. The average (median) monthly contract rent was $27 for private units occupied by white tenants and $13 for those occupied by Negro tenants. Among the tenant units containing one or more veterans, the average monthly rental was $28 for units occupied by white families and $15 for those occupied by Negroes. (See tables 6 and 7 on page 7.) These units were rented by the heads of the households and not necessarily by the veterans themselves.

3644/

Separate analysis for New Orleans city alone showed that 30.2 percent of all dwelling units were occupied by their owners and 67.9 percent were occupied by tenants. These proportions represent a slight shift from tenant-occupancy to owner-occupancy since April 1940 when a complete enumeration in the Census of Housing showed that 23.0 percent of all the dwelling units in the city were occupied by their owners and 74.0 percent were occupied by tenants.

TECHNICAL NOTE

The findings presented in this report are based on a sample survey in New Orleans city, Amesville, Gretna, Harvey, McDonoughville, Marrero, Metairie, and Westwego. For dwelling unit occupancy and vacancy characteristics, approximately 3,900 dwelling units were enumerated to represent all sections of the area and all types of residential structures except institutions, publicly financed housing projects, transient hotels, commercial rooming houses, trailers, and tourist cabins. For information on veterans' housing characteristics and intentions, the enumeration was extended to include veterans in all types of residential structures except institutions and transient hotels. Occupancy and vacancy data for publicly financed housing for the New Orleans locality were obtained from reports of the National Housing Agency as of the end of July.

The number of privately financed dwelling units shown in this report for the area is an estimate based on the weighted sample results and the 1940 census data plus building permit records. The number of World War II veterans is an estimate of the number of veterans in the locality exclusive of those in institutions and hotels. This figure was based on the weighted sample results and on an independent estimate derived from the distribution of veterans by state of preservice residence and the proportion of 1-C Selective Service registrants in the locality. This estimate is only a rough approximation but is the best that can be made from the limited information available.

An examination of the results shows that this survey, like practically all others based upon a field canvass of a cross-section of the population, did not cover a proportionate share of the most mobile parts of the population, e.g., veterans who were traveling about preparatory to taking a job and establishing a residence. In addition, some persons who were actually veterans were not identified as such because of inaccurate or inadequate information furnished by the respondents. The characteristics of such groups may not be the same as those of the enumerated veterans, but in the absence of information concerning these characteristics no adjustment has been made in the results of the survey because of this factor.

The figures presented in this report may differ somewhat from the results which would have been obtained by a complete census because of sampling variability. The following are examples of the magnitude of the sampling variations and the probability of their occurrence for three of the more significant statistics quoted in this report. For the 23 percent of the total veterans who would like to buy or build a house, the chances are two out of three that the rate which would have been obtained by a complete census is between 21 percent and 25 percent. For the 24 percent of the married white veterans who were living doubled-up, the chances are two out of three that the rate which would have been obtained by a complete census is between 21 percent and 27 percent; and for the 53 percent of the married Negro veterans who were renting the dwelling units in which they lived, the chances are two out of three that the rate would have been between 47 percent and 59 percent. Since the sampling variability of any percentage depends not only on the value of the percent, but also on the size of the base on which the percentage is determined, the variations shown in the examples should not be applied indiscriminately to all percentages quoted in this report.

In addition to sampling variability, the estimates are subject to errors of response. Such errors may be expected to affect the sample estimates to about the same degree as they would affect the results of a complete census.

DEPARTMENT OF COMMERCE
Bureau of the Census

Population: HVet-No. 78

Survey of World War II Veterans and Dwelling Unit Vacancy and Occupancy in the Houston Area, Texas

Approximately one-fourth of the married white World War II veterans and one-half of the married Negro veterans in the Houston area were doubling up with relatives or friends or were living in rented rooms, trailers, or tourist cabins according to the results of a sample survey released today by Director J. C. Capt, Bureau of the Census. The survey, made during early August at the request of the National Housing Agency for the Veterans Emergency Housing Program, further showed that about one-tenth of the married white veterans and three-tenths of the married Negro veterans lived in dwelling units which needed major repairs or lacked one or more standard plumbing facilities—running water, private flush toilet, and private bath.

Of the estimated 40,000 World War II veterans living in the Houston area at the time of the survey, 36,000 were white and 4,000 were Negro. Two-thirds of the white veterans were married and one-third were single, widowed, or divorced. Among the Negro veterans, the proportions of married and single were about the same as among the white veterans.

The survey also inquired into the housing plans of all the veterans for the next 12 months. When asked what they would do if housing would be available during the next year only at present prices and quality, 13 percent of the white veterans said they would be in the housing market—11 percent would buy or build a house and 2 percent would move and rent. Of the Negro veterans, 15 percent would be in the housing market—10 percent would buy or build and 5 percent would move and rent.

An additional 25 percent of the white veterans and 30 percent of the Negro veterans would be drawn into the housing market if they could find houses at the price, size, and quality they desire. Under such conditions, a total of 35 percent of the white veterans and 41 percent of the Negro veterans would buy or build a house within the next 12 months; and 3 percent of the white and 4 percent of the Negro veterans would move and rent.

VETERANS' HOUSING PLANS FOR THE NEXT 12 MONTHS

Of those who plan to buy or build in the present market, the white veterans indicated they are able to pay an average (median) price of $5,000 and seven-tenths of the Negro veterans reported they are able to pay $3,000 or less.

Among the white veterans who would buy or build if houses are available at the price and quality they desire, the average (median) price they reported they would be able to pay for a house was $5,000 and the average (median) gross monthly payment they would be able to make, including payments for real estate taxes, fire insurance, heat, light, and cooking fuel, was $50. Their average (median) weekly income from all sources was $54. The average size house they desired was five rooms. Negro veterans who would buy or build under these conditions reported an average price of $3,000, an average monthly payment of $30, and an average weekly income of $31. The average size house Negro veterans desired was five rooms.

Among the white veterans who would move and rent other quarters if they could get what they wanted, the average gross monthly rental they reported they would be able to pay was $45, their average weekly income was $53, and the average size unit they desired was five rooms. For Negro veterans who would move and rent, the average monthly rental reported was $25, their average weekly income was $31, and the average size unit they desired was four rooms.

36581

GENERAL CHARACTERISTICS OF VETERANS

Of the estimated 40,000 veterans living in the Houston area at the time of the survey, one-fifth (20 percent) were newcomers to the locality since they entered the service. The proportion of in-migrants for married white veterans was considerably higher than the proportion for single white veterans. Among the Negro veterans, the proportion of in-migrants was slightly higher for the single. (See table 1 on page 5.) Nine-tenths (91 percent) of the married white veterans and two-thirds (66 percent) of the single white veterans were employed. Of the Negro veterans, 85 percent of the married and 68 percent of the single were employed. Veterans in the "other than employed" group included those who did not desire work at the time of the survey as well as those who were seeking employment. Three-fifths of all the veterans who were not working had been discharged since December 31, 1945.

For all veterans, the average (median) weekly income from all sources was $47. Income for white veterans averaged $55 for the married as compared with $34 for the single. Among the Negro veterans, there was less difference—$32 for the married and $26 for the single. (Average income was based on all veterans, including those who reported having no income.)

PRESENT LIVING ARRANGEMENTS OF VETERANS

Hardship among veterans was partly reflected by the extent to which they were doubling up with relatives or friends or were living in rented rooms, trailers, or tourist cabins. One-sixth (17 percent) of the married white veterans and nearly three-tenths (28 percent) of the married Negro veterans were doubling up in ordinary dwelling units, that is, were living in units which contained, in addition to the head of the household, one or more married couples or married women whose husbands were living elsewhere. Forty percent of the single white veterans as compared with 11 percent of the married white veterans were living in rented rooms, trailers, or tourist cabins. For the Negro veterans, these proportions were 47 percent for the single and 25 percent for the married. (See table 2 on page 5.)

Exclusive of those living in rented rooms, about one-twelfth of the total white veterans and one-fourth of the total Negro veterans lived in dwelling units which were in need of major repairs or lacked one or more standard plumbing facilities.

Over one-fourth (28 percent) of the married white and one-eighth (12 percent) of the married Negro veterans owned their homes. (See table 2 on page 5.) About two-fifths of the white and one-third of the Negro owners purchased their homes after they were discharged. One-half (50 percent) of the married white veterans and almost one-half (48 percent) of the married Negro veterans were renting dwelling units in their names at the time of the survey and were paying an average (median) gross monthly rent of $40 and $24 respectively. Approximately three-fifths of the white veterans and one-half of the Negro veterans who were renting acquired their units after they were discharged.

HOUSING PLANS OF VETERANS

More than nine-tenths (94 percent) of the total veterans plan to remain in the Houston locality for the coming year. Three percent of the veterans plan to leave the locality and three percent are undecided in their plans. (See table 3 on page 6.)

If housing is available during the year only at present prices and quality, 11 out of every 100 white veterans plan to buy or build in the locality, 2 plan to move and rent, 81 plan to remain in their present quarters, and the remaining 6 plan to move into rented rooms or double up, leave the area, or are undecided. Out of every 100 Negro veterans, 10 plan to buy or build, 5 plan to move and rent, 70 plan to remain in their present quarters, and the remaining 15 have other plans.

However, if the veterans could find what they want, 35 out of every 100 white veterans would buy or build a house, 3 would move and rent, and only 56 would remain in their present quarters during the coming year. If the Negro veterans could find what they want, 41 out of every 100 would buy or build a house, 4 would move and rent, and only 40 would remain in their present quarters. (See table 5 on page 6.)

For the white veterans who would buy or build if they could find what they want, the average (median) price house they said they could afford was $5,000 and one-fourth of the veterans could pay only $4,000 or even less. Negro veterans desiring to buy or build reported they could afford to pay an average price of $3,000 with one-fourth able to pay only $2,000 or even less. Nearly nine-tenths of the white veterans preferred five- or six-room houses and four-fifths of the Negro veterans preferred four- or five-room houses. Three-fifths of the white veterans and about two-fifths of the Negro veterans who would buy or build a house have taken some action toward buying or building or have saved money specifically for a house.

Practically all of the prospective home owners would purchase through monthly payments. The gross monthly payments they reported they would be able to make, including real estate taxes, fire insurance, heat, light, and cooking fuel, averaged $50 for white veterans and $30 for Negro veterans. However, one-fourth of the white veterans planning to buy or build reported they could pay only $40 or less and one-fourth of the Negro veterans could pay only $25 or less.

For the veterans who would move and rent if they could find what they want, the average (median) gross monthly rental they reported they would be able to pay, including payments for heat, light, and cooking fuel, was $45 for white and $25 for Negro veterans. Units in single-family structures were preferred by three-fourths of all the veterans who would like to rent.

AVAILABILITY AND CHARACTERISTICS OF PRESENT HOUSING

In conjunction with the survey of veterans to determine their general characteristics, present living arrangements and housing plans, information on occupancy and vacancy in dwelling units was collected. Tables 6, 7, and 8 on the following pages summarize the availability and characteristics of vacant dwelling units and tenure, rent, facilities, and doubling up in occupied dwelling units.

The survey showed that 1.8 percent of all the dwelling units in the Houston area including privately and publicly financed dwelling units, were unoccupied. The gross vacancy rate for privately financed dwelling units alone was the same, 1.8 percent, indicating an increase in the number of unoccupied private dwelling units since November 1945 when a similar survey made by the Bureau of Labor Statistics showed a gross vacancy rate of 0.4 percent.

According to the recent survey about four-fifths of the private vacancies were habitable; of these, approximately two-fifths lacked installed cooking facilities. One-fourth of the habitable vacancies were being offered for rent or sale and the remainder were either already rented or sold or were being held off the rental or sale market for other reasons.

Almost three-fourths (73 percent) of the habitable vacancies had been unoccupied for less than 1 month, three-tenths (29 percent) were located in converted structures (structures in which the number of dwelling units has changed since the original construction), nearly two-thirds (64 percent) were units in single-family structures without business, and the average size was four rooms.

The survey further showed that 20 percent of the privately financed dwelling units in which white veterans lived contained doubled-up families as compared with 10 percent for all private units occupied by white families. For Negroes the proportions were 40 percent and 13 percent respectively. (See table 7 on page 7.) Practically all of the veteran-occupied units with doubled-up families contained one or more married couples in addition to the head of the household while very few contained only married women in addition to the head.

One-half (49.4 percent) of all the private dwelling units in the Houston area were occupied by their owners and nearly one-half (48.8 percent) were occupied by tenants. The average (median) monthly contract rent was $34 for private units occupied by white tenants and $22 for those occupied by Negro tenants. (See tables 6 and 7 on page 7.) Among the tenant units containing one or more veterans, the average monthly rental was $35 for units occupied by white families and $22 for those occupied by Negroes. These units were rented by the heads of the households and not necessarily by the veterans themselves.

The proportions of owner-occupied and tenant-occupied dwelling units in August 1946 represent a substantial shift from tenant-occupancy to owner-occupancy since April 1940 when a complete enumeration in the Census of Housing showed that 33.5 percent of all the dwelling units in the area were occupied by their owners and 61.3 percent were occupied by tenants.

36581

TECHNICAL NOTE

The findings presented in this report are based on a sample survey in Houston city, Galena Park city, and Bellaire, Pasadena, South Houston, and West University Place towns. For dwelling unit occupancy and vacancy characteristics, approximately 5,300 dwelling units were enumerated to represent all sections of the area and all types of residential structures except institutions, publicly financed housing projects, transient hotels, commercial rooming houses, trailers, and tourist cabins. For information on veterans' housing characteristics and intentions, the enumeration was extended to include veterans in all types of residential structures except institutions and transient hotels. Occupancy and vacancy data for publicly financed housing for the Houston locality were obtained from reports of the National Housing Agency as of the end of August.

The number of privately financed dwelling units shown in this report for the area is an estimate based on the weighted sample results and the 1940 census data plus building permit records. The number of World War II veterans is an estimate of the number of veterans in the locality exclusive of those in institutions and hotels. This figure was based on the weighted sample results and on an independent estimate derived from the distribution of veterans by state of preservice residence and the proportion of 1-C Selective Service registrants in the locality. This estimate is only a rough approximation but is the best that can be made from the limited information available.

An examination of the results shows that this survey, like practically all others based upon a field canvass of a cross-section of the population, did not cover a proportionate share of the most mobile parts of the population, e.g., veterans who were traveling about preparatory to taking a job and establishing a residence. In addition, some persons who were actually veterans were not identified as such because of inaccurate or inadequate information furnished by the respondents. The characteristics of such groups may not be the same as those of the enumerated veterans, but in the absence of information concerning these characteristics no adjustment has been made in the results of the survey because of this factor.

The figures presented in this report may differ somewhat from the results which would have been obtained by a complete census because of sampling variability. The following are examples of the magnitude of the sampling variations and the probability of their occurrence for three of the more significant statistics quoted in this report. For the 36 percent of the total veterans who would buy or build a house, the chances are two out of three that the rate which would have been obtained by a complete census is between 33 percent and 39 percent. For the 28 percent of the married white veterans who owned their homes the chances are two out of three that the rate which would have been obtained by a complete census is between 25 percent and 31 percent; and for the 28 percent of the married Negro veterans who were living doubled-up, the chances are two out of three that the rate would have been between 22 percent and 34 percent. Since the sampling variability of any percentage depends not only on the value of the percent, but also on the size of the base on which the percentage is determined, the variations shown in the examples should not be applied indiscriminately to all percentages quoted in this report.

In addition to sampling variability, the estimates are subject to errors of response. Such errors may be expected to affect the sample estimates to about the same degree as they would affect the results of a complete census.

DEPARTMENT OF COMMERCE
Bureau of the Census

Population: HVet-No. 79

Survey of World War II Veterans and Dwelling Unit Vacancy and Occupancy in the Roanoke Area, Virginia

Approximately one-third of the married white World War II veterans and two-fifths of the married Negro veterans in the Roanoke area were doubling up with relatives or friends or were living in rented rooms, trailers, or tourist cabins according to the results of a sample survey released today by Director J. C. Capt, Bureau of the Census. The survey, made during September at the request of the National Housing Agency for the Veterans Emergency Housing Program, further showed that one-sixth of the married white veterans and three-eighths of the married Negro veterans lived in dwelling units which needed major repairs or lacked one or more standard plumbing facilities--running water, private flush toilet, and private bath.

Of the estimated 7,000 World War II veterans living in the Roanoke area at the time of the survey, 6,400 were white and 600 were Negro. About three-fifths of the white veterans were married and two-fifths were single, widowed, or divorced. Among the Negro veterans, one-half were married.

The survey also inquired into the housing plans of all the veterans for the next 12 months. When asked what they would do if housing would be available during the next year only at present prices and quality, 25 percent of the white veterans said they would be in the housing market—20 percent would buy or build a house and 5 percent would move and rent. Of the Negro veterans, 18 percent would be in the housing market--15 percent would buy or build and 3 percent would move and rent.

An additional 6 percent of the white veterans and 7 percent of the Negro veterans would be drawn into the housing market if they could find houses at the price, size, and quality they desire. Under such conditions, a total of 27 percent of the white veterans and 22 percent of the Negro veterans would buy or build a house within the next 12 months; and 4 percent of the white and 3 percent of the Negro veterans would move and rent.

VETERANS' HOUSING PLANS FOR THE NEXT 12 MONTHS

Of those who plan to buy or build in the present market, the white veterans indicated they are able to pay an average (median) price of $6,000 and Negro veterans reported they are able to pay $3,500.

Among the white veterans who would buy or build if houses are available at the price and quality they desire, the average (median) price they reported they would be able to pay for a house was $6,000 and the average (median) gross monthly payment they would be able to make, including payments for real estate taxes, fire insurance, heat, light, and cooking fuel, was $45. Their average (median) weekly income from all sources was $50. The average size house they desired was six rooms. Negro veterans who would buy or build under these conditions reported an average price of $3,500, an average monthly payment of $30, and an average weekly income of $34. The average size house Negro veterans desired was six rooms.

Among the white veterans who would move and rent other quarters if they could get what they wanted, the average gross monthly rental they reported they would be able to pay was $35, their average weekly income was $50, and the average size unit they desired was four rooms. Two-thirds of the Negro veterans who would move and rent reported they could pay a monthly rental of $22 or less. The average weekly income for Negro veterans who would move and rent was $33, and the average size unit they desired was four rooms.

36582

GENERAL CHARACTERISTICS OF VETERANS

Of the estimated 7,000 veterans living in the Roanoke area at the time of the survey, one-sixth (17 percent) were newcomers to the locality since they entered the service. The proportion of in-migrants for married veterans was substantially higher than the proportion for single veterans. (See table 1 on page 5.)

Nine-tenths of the married veterans and six-tenths of the single veterans were employed. Veterans in the "other than employed" group included those who did not desire work at the time of the survey as well as those who were seeking employment. Nearly three-fifths of all the veterans who were not working had been discharged since December 31, 1945.

For all veterans, the average (median) weekly income from all sources was $41. Income for white veterans averaged $50 for the married as compared with $26 for the single. Among the Negro veterans there was less difference--$34 for the married and $27 for the single. (Average income was based on all veterans, including those who reported having no income.)

PRESENT LIVING ARRANGEMENTS OF VETERANS

Hardship among veterans was partly reflected by the extent to which they were doubling up with relatives or friends or were living in rented rooms, trailers, or tourist cabins. One-fifth (20 percent) of the married white veterans and a slightly higher proportion (23 percent) of the married Negro veterans were doubling up in ordinary dwelling units, that is, were living in units which contained, in addition to the head of the household, one or more married couples or married women whose husbands were living elsewhere. Thirty-three percent of the single white veterans as compared with 13 percent of the married white veterans were living in rented rooms, trailers, or tourist cabins. For the Negro veterans, these proportions were 34 percent for the single and 20 percent for the married. (See table 2 on page 5.)

Exclusive of those living in rented rooms, about one-eighth of the total white veterans and one-third of the total Negro veterans lived in dwelling units which were in need of major repairs or lacked one or more standard plumbing facilities.

Over one-fifth (22 percent) of the married white and about one-fifth (19 percent) of the married Negro veterans owned their homes. (See table 2 on page 5.) Three-fifths of the white and three-eighths of the Negro owners purchased their homes after they were discharged. Two-fifths (41 percent) of the married white veterans and over one-fifth (22 percent) of the married Negro veterans were renting dwelling units in their names at the time of the survey and were paying an average (median) gross monthly rent of $33 and $18 respectively. Two-thirds of both the white and the Negro veterans who were renting acquired their units after they were discharged.

HOUSING PLANS OF VETERANS

More than nine-tenths (94 percent) of the total veterans plan to remain in the Roanoke locality for the coming year. Three percent of the veterans plan to leave the locality and three percent are undecided in their plans. (See table 3 on page 6.)

If housing is available during the year only at present prices and quality, 20 out of every 100 white veterans plan to buy or build in the locality, 5 plan to move and rent, 68 plan to remain in their present quarters, and the remaining 7 plan to move into rented rooms or double up, leave the area, or are undecided. Out of every 100 Negro veterans, 15 plan to buy or build, 3 plan to move and rent, 73 plan to remain in their present quarters, and the remaining 9 have other plans.

However, if the veterans could find what they want, 27 out of every 100 white veterans would buy or build a house, 4 would move and rent, and only 62 would remain in their present quarters during the coming year. If the Negro veterans could find what they want, 22 out of every 100 would buy or build a house, 3 would move and rent, and 66 would remain in their present quarters. (See table 5 on page 6.)

36582

For the white veterans who would buy or build if they could find what they want, the average (median) price house they said they could afford was $6,000 and one-fourth of the veterans could pay only $5,000 or even less. Negro veterans desiring to buy or build reported they could afford to pay an average price of $3,500 with one-fourth able to pay only $3,000 or even less. Four-fifths of both the white and the Negro veterans preferred five- or six-room houses. About four-fifths of the white veterans and two-thirds of the Negro veterans who would buy or build a house have taken some action toward buying or building or have saved money specifically for a house.

Practically all of the prospective home owners would purchase through monthly payments. The gross monthly payments they reported they would be able to make, including real estate taxes, fire insurance, heat, light, and cooking fuel, averaged $45 for white veterans and $30 for Negro veterans. However, one-fourth of the white veterans planning to buy or build reported they could pay only $40 or less and one-fourth of the Negro veterans could pay only $25 or less.

For the white veterans who would move and rent if they could find what they want, the average (median) gross monthly rental they reported they would be able to pay, including payments for heat, light, and cooking fuel, was $35. Two-thirds of the Negro veterans who would move and rent reported they could pay $22 or less. Units in single-family structures were preferred by seven-tenths of the white and practically all of the Negro veterans who would like to rent.

AVAILABILITY AND CHARACTERISTICS OF PRESENT HOUSING

In conjunction with the survey of veterans to determine their general characteristics, present living arrangements and housing plans, information on occupancy and vacancy in dwelling units was collected. Tables 6, 7, and 8 on the following pages summarize the availability and characteristics of vacant dwelling units and tenure, rent, facilities, and doubling up in occupied dwelling units.

The survey showed that 0.6 percent of all the dwelling units in the Roanoke area were unoccupied. Almost all of the vacant units were habitable. Of these, approximately one-third lacked installed cooking facilities for the exclusive use of the intended occupants. About one-sixth of the habitable vacancies were being offered for rent or sale and the remainder were either already rented or sold or were being held off the rental or sale market for other reasons.

Nearly three-fifths (58 percent) of the habitable vacancies were built before 1920, one-fifth (20 percent) were located in converted structures (structures in which the number of dwelling units has changed since the original construction). Almost nine-tenths (87 percent) were units in single-family structures without business, and the average size was five rooms.

The survey further showed that 21 percent of the dwelling units in which white veterans lived contained doubled-up families as compared with 14 percent for all units occupied by white families. For Negroes the proportions were 17 percent and 4 percent respectively. (See table 7 on page 7.) Practically all of the veteran-occupied units with doubled-up families contained one or more married couples in addition to the head of the household while very few contained only married women in addition to the head.

Nearly three-fifths (57.9 percent) of all the dwelling units in the Roanoke area were occupied by their owners and about two-fifths (41.5 percent) were occupied by tenants. The average (median) monthly contract rent was $31 for units occupied by white tenants and $13 for those occupied by Negro tenants. Among the tenant units containing one or more veterans, the average monthly rental was $29 for units occupied by white families and $15 for those occupied by Negroes. (See tables 6 and 7 on page 7.) These units were rented by the heads of the households and not necessarily by the veterans themselves.

The proportions of owner-occupied and tenant-occupied dwelling units in September 1946 represent a considerable shift from tenant-occupancy to owner-occupancy since April 1940 when a complete enumeration in the Census of Housing showed that 40.6 percent of all the dwelling units in the area were occupied by their owners and 56.8 percent were occupied by tenants. (The 1940 tenure figures do not include the adjacent built-up area north of the city and the sections annexed to Roanoke in 1943 which represent approximately one-tenth of the total survey area.)

36582

In the city of Roanoke, exclusive of the annexations in 1943, the results of the survey indicate a similar shift from tenant-occupancy to owner-occupancy since April 1940; 55.3 percent of the dwelling units were occupied by their owners and 44.3 percent were occupied by tenants in September 1946 as compared with 39.2 percent owner-occupied and 58.1 percent tenant-occupied in April 1940.

TECHNICAL NOTE

The findings presented in this report are based on a sample survey in Roanoke city, the adjacent built-up area north of the city to Hershberger Road, and the towns of Salem and Vinton. For dwelling unit occupancy and vacancy characteristics, approximately 5,600 dwelling units were enumerated to represent all sections of the area and all types of residential structures except institutions, publicly financed housing projects, transient hotels, commercial rooming houses, trailers, and tourist cabins. For information on veterans' housing characteristics and intentions, the enumeration was extended to include veterans in all types of residential structures except institutions and transient hotels.

The number of dwelling units shown in this report for the area is an estimate based on the weighted sample results and the 1940 census data plus building permit records. The number of World War II veterans is an estimate of the number of veterans in the locality exclusive of those in institutions and hotels. This figure was based on the weighted sample results and on an independent estimate derived from the distribution of veterans by state of preservice residence and the proportion of 1-C Selective Service registrants in the locality. This estimate is only a rough approximation but is the best that can be made from the limited information available.

An examination of the results shows that this survey, like practically all others based upon a field canvass of a cross-section of the population, did not cover a proportionate share of the most mobile parts of the population, e.g. veterans who were traveling about preparatory to taking a job and establishing a residence. In addition, some persons who were actually veterans were not identified as such because of inaccurate or inadequate information furnished by the respondents. The characteristics of such groups may not be the same as those of the enumerated veterans, but in the absence of information concerning these characteristics no adjustment has been made in the results of the survey because of this factor.

The figures presented in this report may differ somewhat from the results which would have been obtained by a complete census because of sampling variability. In general, the allowance to be made for sampling variation depends both on the numerical value of the percentage and the size of the base on which the percentage is determined, a percentage based on a larger number of dwelling units or veterans being less variable than one based on a smaller number. For example, in at least two out of three instances, almost all of the estimated percentages based on total veterans (column 1 of tables 1 through 5) may be expected to be not more than two percentage points larger or smaller than the percentages which would have been obtained if a complete census had been taken. Almost all of the percentages based on married white veterans are subject to an allowance of plus or minus three percentage points while those based on married Negro veterans are subject to an allowance of plus or minus one percentage point. Thus for the 27 percent of the total veterans who would like to buy or build a house it may be expected that the proportion which would have been obtained by a complete census would have been between 25 percent and 29 percent; for the 20 percent of the married white veterans who were living doubled up, the proportion would have been between 17 percent and 23 percent.

In addition to sampling variability, the estimates are subject to errors of response. Such errors may be expected to affect the sample estimates to about the same degree as they would affect the results of a complete census.

DEPARTMENT OF COMMERCE
Bureau of the Census

Not to be released until
January 25, 1947

Population: HVet-No. 82

Survey of World War II Veterans and Dwelling Unit Vacancy and Occupancy in the Shreveport Area, Louisiana

Approximately two-fifths of the married white World War II veterans and one-half of the married Negro veterans in the Shreveport area were doubling up with relatives or friends or were living in rented rooms, trailers, or tourist cabins according to the results of a recent sample survey released today by Director J. C. Capt, Bureau of the Census. The survey, made at the request of the National Housing Agency for the Veterans Emergency Housing Program, further showed that one-tenth of the married white veterans and nearly three-fifths of the married Negro veterans lived in dwelling units which needed major repairs or lacked one or more standard plumbing facilities—running water, private flush toilet, and private bath.

Of the estimated 11,000 World War II veterans living in the area at the time of the survey, 8,500 were white and 2,500 were Negro. About two-thirds of the white veterans were married and one-third were single, widowed, or divorced. Among the Negro veterans, three-fifths were married.

The survey also inquired into the housing plans of all the veterans for the next 12 months. When asked what they would do if housing would be available during the next year only at present prices and quality, 17 percent of the white veterans said they would be in the housing market--11 percent would buy or build a house and 6 percent would move and rent. Of the Negro veterans, 13 percent would be in the housing market—8 percent would buy or build and 5 percent would move and rent.

An additional 18 percent of the white veterans and 14 percent of the Negro veterans would be drawn into the housing market if they could find houses at the price, size, and quality they desire. Under such conditions, a total of 30 percent of the white veterans and 23 percent of the Negro veterans would buy or build a house within the next 12 months; and 5 percent of the white and 4 percent of the Negro veterans would move and rent.

VETERANS' HOUSING PLANS FOR THE NEXT 12 MONTHS

Of those who plan to buy or build in the present market, the white veterans indicated they are able to pay an average (median) price of $6,500 and Negro veterans reported they are able to pay $2,300.

Among the white veterans who would buy or build if houses are available at the price and quality they desire, the average (median) price they reported they would be able to pay for a house was $6,000 and the average (median) gross monthly payment they would be able to make was $45. Their average (median) weekly income from all sources was $54. The average size house they desired was five rooms. Negro veterans who would buy or build under these conditions reported an average price of $2,300, an average monthly payment of $25, and an average weekly income of $31. The average size house Negro veterans desired was five rooms.

Among the white veterans who would move and rent other quarters if they could get what they wanted, the average gross monthly rental they reported they would be able to pay was $40, their average weekly income was $48, and the average size unit they desired was four rooms. For Negro veterans who would move and rent, the average monthly rental reported was $20, their average weekly income was $31, and the average size unit they desired was four rooms.

37245

GENERAL CHARACTERISTICS OF VETERANS

Of the estimated 11,000 veterans living in the Shreveport area at the time of the survey, one-fifth (20 percent) were newcomers to the locality since they entered the service. The proportion of in-migrants for white veterans was slightly higher than the proportion for Negro veterans. (See table 1 on page 5.)

Nine-tenths (89 percent) of the married white veterans and six-tenths (61 percent) of the single white veterans were employed. Of the Negro veterans, 85 percent of the married and 62 percent of the single were employed. Veterans in the "other than employed" group included those who did not desire work at the time of the survey as well as those who were seeking employment. Almost three-fifths of all the veterans who were not working had been discharged since December 31, 1945.

For all veterans, the average (median) weekly income from all sources was $42. Income for white veterans averaged $55 for the married as compared with $32 for the single. Among the Negro veterans there was less difference--$31 for the married and $25 for the single. (Average income was based on all veterans, including those who reported having no income.)

PRESENT LIVING ARRANGEMENTS OF VETERANS

Hardship among veterans was partly reflected by the extent to which they were doubling up with relatives or friends or were living in rented rooms, trailers, or tourist cabins. Approximately one-sixth (18 percent) of the married white veterans and about the same proportion (16 percent) of the married Negro veterans were doubling up in ordinary dwelling units, that is, were living in units which contained, in addition to the head of the household, one or more married couples or married women whose husbands were living elsewhere. Twenty-three percent of the single white veterans and 22 percent of the married white veterans were living in rented rooms, trailers, or tourist cabins. For the Negro veterans, these proportions were 42 percent for the single and 32 percent for the married. (See table 2 on page 5.)

Exclusive of those living in rented rooms, about one-tenth of the total white veterans and one-half of the total Negro veterans lived in dwelling units which were in need of major repairs or lacked one or more standard plumbing facilities.

More than one-fourth (28 percent) of the married white and one-eighth (13 percent) of the married Negro veterans owned their homes. (See table 2 on page 5.) Almost one-half of the white and slightly more than one-fourth of the Negro owners purchased their homes after they were discharged. Three-tenths (31 percent) of the married white veterans and more than four-tenths (44 percent) of the married Negro veterans were renting dwelling units in their names at the time of the survey and were paying an average (median) gross monthly rent of $38 and $17. respectively. Seven-tenths of the white veterans and four-tenths of the Negro veterans who were renting acquired their units after they were discharged.

HOUSING PLANS OF VETERANS

Nine-tenths (89 percent) of the total veterans plan to remain in the Shreveport and Bossier City locality for the coming year. Five percent of the veterans plan to leave the locality and six percent are undecided in their plans. (See table 3 on page 6.)

If housing is available during the year only at present prices and quality, 11 out of every 100 white veterans plan to buy or build in the locality, 6 plan to move and rent, 71 plan to remain in their present quarters, and the remaining 12 plan to move into rented rooms or double up, leave the area, or are undecided. Out of every 100 Negro veterans, 8 plan to buy or build, 5 plan to move and rent, 66 plan to remain in their present quarters, and the remaining 21 have other plans.

However, if the veterans could find what they want, 30 out of every 100 white veterans would buy or build a house, 5 would move and rent, and only 54 would remain in their present quarters during the coming year. If the Negro veterans could find what they want, 23 out of every 100 would buy or build a house, 4 would move and rent, and 52 would remain in their present quarters. (See table 5 on page 6.)

37245

For the white veterans who would buy or build if they could find what they want, the average (median) price house they said they could afford was $6,000. One-fourth of these veterans could pay only $4,500 or less, and one-fourth could pay $8,000 or more. Negro veterans desiring to buy or build reported they could afford to pay an average price of $2,300. One-fifth of these veterans would be able to pay only $1,500 or less, and one-third could pay $3,000 or more. Five-sixths of the white veterans preferred five- or six-room houses and seven-tenths of the Negro veterans preferred four- or five-room houses. About three-fifths of the white veterans and two-fifths of the Negro veterans who would buy or build a house have taken some action toward buying or building or have saved money specifically for a house.

Practically all of the prospective home owners would purchase through monthly payments. The gross monthly payments they reported they would be able to make, including real estate taxes, fire insurance, heat, light, and cooking fuel, averaged $45 for white veterans and $25 for Negro veterans. One-fifth of the white veterans planning to buy or build reported they could pay only $30 or less and only one-sixth could pay more than $50. Among the Negro veterans, one-third could pay $20 or less, and only three-tenths could pay $35 or more.

For the veterans who would move and rent if they could find what they want, the average (median) gross monthly rental they reported they would be able to pay, including payments for heat, light, and cooking fuel, was $40 for white and $20 for Negro veterans. One-fourth of the white veterans who plan to move and rent reported they could pay only $30 or less, and three-tenths could pay $45 or more. Among the Negro veterans, three-tenths could pay only $15 or less, and one-fourth could pay $30 or more. Units in single-family structures were preferred by seven-tenths of all the veterans who would like to rent.

AVAILABILITY AND CHARACTERISTICS OF PRESENT HOUSING

In conjunction with the survey of veterans to determine their general characteristics, present living arrangements and housing plans, information on occupancy and vacancy in dwelling units was collected. Tables 6, 7, and 8 on the following pages summarize the availability and characteristics of vacant dwelling units and tenure, rent, facilities, and doubling up in occupied dwelling units.

The survey showed that 1.0 percent of all the dwelling units in Shreveport and Bossier City, including privately and publicly financed dwelling units, were unoccupied. The gross vacancy rate for privately financed dwelling units alone was the same, 1.0 percent, indicating little change in the number of unoccupied private dwelling units in the area since June 1945 when a similar survey showed a gross vacancy rate of 0.9 percent.

According to the recent survey nine-tenths of the private vacancies were habitable; of these, one-tenth lacked installed cooking facilities. About two-fifths of the habitable vacancies were being offered for rent or sale and the remainder were either already rented or sold or were being held off the rental or sale market for other reasons.

Almost one-half (46 percent) of the habitable vacancies were built before 1940, one-half (50 percent) had been vacant less than one week, nearly one-fifth lacked one or more standard plumbing facilities, and the average size was five rooms.

The survey further showed that 20 percent of the privately financed dwelling units in which white veterans lived contained doubled-up families as compared with 9 percent for all private units occupied by white families. For Negroes the proportions were 23 percent and 9 percent respectively. (See table 7 on page 7.) Practically all of the veteran-occupied units with doubled-up families contained one or more married couples in addition to the head of the household while very few contained only married women in addition to the head.

Almost one-half (49.0 percent) of all the private dwelling units in Shreveport and Bossier City were occupied by their owners and one-half (50.0 percent) were occupied by tenants. The average (median) monthly contract rent was $33 for private units occupied by white tenants and $13 for those occupied by Negro tenants. (See tables 6 and 7 on page 7.) Among the tenant units containing one or more veterans, the average monthly rental was $33 for units occupied by white families and $14 for those occupied by Negroes. These units were rented by the heads of the households and not necessarily by the veterans themselves.

37245

The proportions of owner-occupied and tenant-occupied dwelling units in November 1946 represent a considerable shift from tenant-occupancy to owner-occupancy since April 1940 when a complete enumeration in the Census of Housing showed that 37.8 percent of all the dwelling units in the area were occupied by their owners and 61.7 percent were occupied by tenants. (The 1940 tenure figures do not include the areas annexed to Bossier City since that time; however, the annexations represent only a small portion of the total survey area.)

TECHNICAL NOTE

The findings presented in this report are based on a sample survey made in August and supplemented in October and November for additional information in Shreveport and Bossier City. For dwelling unit occupancy and vacancy characteristics, approximately 7,200 dwelling units were enumerated to represent all sections of the area and all types of residential structures except institutions, publicly financed housing projects, transient hotels, commerical rooming houses, trailers, and tourist cabins. For information on veterans' housing characteristics and intentions, the enumeration was extended to include veterans in all types of residential structures except institutions and transient hotels. Occupancy and vacancy data for publicly financed housing for the Shreveport locality were obtained from reports of the National Housing Agency as of the end of November.

The number of privately financed dwelling units shown in this report for the area is an estimate based on the weighted sample results and the 1940 census data plus building permit records. The number of World War II veterans shown in this report is an estimate of the number of veterans in the locality exclusive of those in institutions and hotels. This figure was based on the weighted sample results and on an independent estimate derived from the distribution of veterans by state of preservice residence and the proportion of 1-C Selective Service registrants in the locality. This estimate is only a rough approximation but is the best that can be made from the limited information available.

An examination of the results shows that this survey, like practically all others based upon a field canvass of a cross-section of the population, did not cover a proportionate share of the most mobile parts of the population, e.g., veterans who were traveling about preparatory to taking a job and establishing a residence. In addition, some persons who were actually veterans were not identified as such because of inaccurate or inadequate information furnished by the respondents. The characteristics of such groups may not be the same as those of the enumerated veterans, but in the absence of information concerning these characteristics no adjustment has been made in the results of the survey because of this factor.

The figures presented in this report may differ somewhat from the results which would have been obtained from a complete census because of sampling variability. The following are examples of the magnitude of the sampling variations and the probability of their occurrence for three of the more significant statistics quoted in this report. For the 28 percent of the total veterans who would like to buy or build a house, the chances are two out of three that the rate which would have been obtained by a complete census is between 26 percent and 30 percent. For the 18 percent of the married white veterans who were living doubled-up, the chances are two out of three that the rate which would have been obtained by a complete census is between 15 percent and 21 percent; and for the 44 percent of the married Negro veterans who rented their dwelling units, the chances are two out of three that the rate would have been between 40 percent and 48 percent. Since the sampling variability of any percentage depends not only on the value of the percent, but also on the size of the base on which the percentage is determined, the variations shown in the examples should not be applied indiscriminately to all percentages quoted in this report.

In addition to sampling variability, the estimates are subject to errors of response. Such errors may be expected to affect the sample estimates to about the same degree as they would affect the results of a complete census.

January Report

Veterans Emergency Housing Program

RECEIVED
MAR 6 1947
Southern Regional Council

OFFICE OF THE HOUSING EXPEDITER

Not to be released until
February 4, 1947

DEPARTMENT OF COMMERCE
Bureau of the Census

Population HVet-No. 84

Survey of World War II Veterans and Dwelling Unit Vacancy and Occupancy in the Washington, D. C., Metropolitan District

Approximately one-fourth of the married white World War II veterans and seven-tenths of the married Negro veterans in the Washington area were doubling up with relatives or friends or were living in rented rooms, trailers, or tourist cabins according to the results of a recent sample survey released today by Director J. C. Capt, Bureau of the Census. The survey, made at the request of the National Housing Agency for the Veterans Emergency Housing Program, further showed that one-tenth of the married white veterans and two-tenths of the married Negro veterans lived in dwelling units which needed major repairs or lacked one or more standard plumbing facilities--running water, private flush toilet, and private bath.

Of the estimated 120,000 World War II veterans living in the area at the time of the survey, 84,000 were white and 36,000 were Negro. Three-fifths of the white veterans were married and two-fifths were single, widowed, or divorced. Among the Negro veterans, slightly more than one-half were married.

The survey also inquired into the housing plans of all the veterans for the next 12 months. When asked what they would do if housing should be available during the next year only at present prices and quality, 11 percent of the white veterans said they would be in the housing market--2 percent would buy or build a house and 9 percent would move and rent. Of the Negro veterans, 20 percent would be in the housing market--4 percent would buy or build and 16 percent would move and rent.

An additional 18 percent of the white veterans and 13 percent of the Negro veterans would be drawn into the housing market if they could find houses at the price, size, and quality they desire. Under such conditions, a total of 20 percent of the white veterans and 14 percent of the Negro veterans would buy or build a house within the next 12 months; and 9 percent of the white and 19 percent of the Negro veterans would move and rent.

VETERANS' HOUSING PLANS FOR THE NEXT 12 MONTHS

Of those who plan to buy or build in the present market, the white veterans indicated they are able to pay an average (median) price of $10,000 and Negro veterans reported they are able to pay $6,000.

Among the white veterans who would buy or build if houses are available at the price and quality they desire, the average (median) price they reported they would be able to pay for a house was $9,000 and the average (median) gross monthly payment they would be able to make, including payments for real estate taxes, fire insurance, heat, light, and cooking fuel, was $60. Their average (median) weekly income from all sources was $67. The average size house they desired was six rooms. Negro veterans who would buy or build under these conditions reported an average price of $6,000, an average monthly payment of $50, and an average weekly income of $39. The average size house Negro veterans desired was six rooms.

Among the white veterans who would move and rent other quarters if they could get what they wanted, two-thirds reported they would be able to pay gross monthly rentals ranging from $50 through $65. The average weekly income of all white veterans who would move and rent was $51, and the average size unit they desired was three rooms. For Negro veterans who would move and rent, the average monthly rental reported was $45, their average weekly income was $35, and the average size unit they desired was four rooms.

37711

GENERAL CHARACTERISTICS OF VETERANS

Of the estimated 120,000 veterans living in the Washington area at the time of the survey, one-sixth (16 percent) were newcomers to the locality since they entered the service. The proportion of in-migrants for married veterans was considerably higher than the proportion for single veterans. (See table 1 on page 5.)

Nine-tenths (90 percent) of the married white veterans and six-tenths (59 percent) of the single white veterans were employed. Of the Negro veterans, 86 percent of the married and 68 percent of the single were employed. Veterans in the "other than employed" group included those who did not desire work at the time of the survey as well as those who were seeking employment. One-half of all the veterans who were not working had been discharged since December 31, 1945.

For all veterans, the average (median) weekly income from all sources was $45. (Average income was based on all veterans, including those who reported having no income.) For employed veterans, the average weekly income was $52. For employed white veterans, weekly incomes averaged $66 for married (including wife's income, if any) and $46 for single veterans; for employed Negro veterans, incomes averaged $38 for married and $32 for single veterans.

PRESENT LIVING ARRANGEMENTS OF VETERANS

Hardship among veterans was partly reflected by the extent to which they were doubling up with relatives or friends or were living in rented rooms, trailers, or tourist cabins. One-seventh (15 percent) of the married white veterans and three-tenths (29 percent) of the married Negro veterans were doubling up in ordinary dwelling units, that is, were living in units which contained, in addition to the head of the household, one or more married couples or married women whose husbands were living elsewhere. Forty percent of the single white veterans as compared with nine percent of the married white veterans were living in rented rooms, trailers, or tourist cabins. For the Negro veterans, these proportions were 59 percent for the single and 42 percent for the married. (See table 2 on page 5.)

Exclusive of those living in rented rooms, about one-eighth of the total white veterans and one-sixth of the total Negro veterans lived in dwelling units which were in need of major repairs or lacked one or more standard plumbing facilities.

Twenty-three percent of the married white and seven percent of the married Negro veterans owned their homes. (See table 2 on page 5.) Approximately three-tenths of the white and four-tenths of the Negro owners purchased their homes after they were discharged. Nearly three-fifths (57 percent) of the married white veterans and one-fourth (25 percent) of the married Negro veterans were renting dwelling units in their names at the time of the survey and were paying an average (median) gross monthly rent of $55 and $48 respectively. One-half of the white veterans and one-half of the Negro veterans who were renting acquired their units after they were discharged.

HOUSING PLANS OF VETERANS

Almost nine-tenths (88 percent) of the total veterans plan to remain in the Washington locality for the coming year. Six percent of the veterans plan to leave the locality and 6 percent are undecided in their plans. (See table 3 on page 6.)

If housing is available during the year only at present prices and quality, 2 out of every 100 white veterans plan to buy or build in the locality, 9 plan to move and rent, 78 plan to remain in their present quarters, and the remaining 11 plan to move into rented rooms or double up, leave the area, or are undecided. Out of every 100 Negro veterans, 4 plan to buy or build, 16 plan to move and rent, 61 plan to remain in their present quarters, and the remaining 19 have other plans.

However, if the veterans could find what they want, 20 out of every 100 white veterans would buy or build a house, 9 would move and rent, and only 60 would remain in their present quarters during the coming year. (See table 5 on page 6.) If the Negro veterans could find what they want, 14 out of every 100 would buy or build a house, 19 would move and rent, and 48 would remain in their present quarters.

For the white veterans who would buy or build if they could find what they want, the average (median) price house they said they could afford was $9,000. One-sixth said they could afford amounts ranging from $1,500 to $8,000 and approximately one-third could afford $10,000 or more. Negro veterans desiring to buy or build reported they could afford to pay an average price of $6,000. About one-fourth said they could pay $5,000 or less and one-third reported $7,500 or more. Nine-tenths of the white veterans and four-fifths of the Negro veterans preferred five- or six-room houses. Approximately three-fifths of the white veterans and two-fifths of the Negro veterans who would buy or build a house have taken some action toward buying or building or have saved money specifically for a house.

Practically all of the prospective home owners would purchase through monthly payments. The gross monthly payments they reported they would be able to make, including real estate taxes, fire insurance, heat, light, and cooking fuel, averaged $60 for white veterans and $50 for Negro veterans. One-fifth of the white veterans planning to buy or build reported they could pay $50 or less and only one-fifth could pay more than $70. Among the Negro veterans, one-third could pay $40 or less, and only one-fifth could pay more than $55.

Two-thirds of the white veterans who would move and rent if they could find what they want reported they would be able to pay from $50 through $65 monthly. Negro veterans who would like to move and rent reported they would be able to pay an average (median) gross monthly rental of $45. One-fourth of the Negro veterans reported they could pay $35 or less, and only one-sixth said they could pay more than $55. Units in the multi-family structures were preferred by three-fifths of all the veterans who would like to move and rent.

AVAILABILITY AND CHARACTERISTICS OF PRESENT HOUSING

In conjunction with the survey of veterans to determine their general characteristics, present living arrangements and housing plans, information on occupancy and vacancy in dwelling units was collected. Tables 6, 7, and 8 on the following pages summarize the availability and characteristics of vacant dwelling units and tenure, rent, facilities, and doubling up in occupied dwelling units.

The survey showed that 0.8 percent of all the dwelling units in the Washington area, including privately and publicly financed dwelling units, were unoccupied. The gross vacancy rate for privately financed dwelling units alone was the same, 0.8 percent—in white neighborhoods, 1.0 percent, and in Negro neighborhoods, 0.4 percent.

Separate analysis for private dwelling units in the city of Washington alone showed a gross vacancy rate of 0.8 percent, indicating a slight increase in the number of unoccupied private dwelling units in the city since November 1945. At that time a similar survey made by the Bureau of Labor Statistics showed a gross vacancy rate of 0.4 percent.

According to the recent survey, three-fourths of the private vacancies in the area were habitable; of these, only one-sixth were being offered for rent or sale and the remainder were either already rented or sold or were being held off the rental or sale market for other reasons.

Two-fifths (40 percent) of the habitable vacancies were built before 1920, one-seventh (15 percent) were located in converted structures (structures in which the number of dwelling units has changed since the original construction), nearly four-fifths (78 percent) were units in single-family structures without business, and the average size was five rooms.

The survey further showed that 13 percent of the privately financed dwelling units in which white veterans lived contained doubled-up families as compared with 7 percent for all private units occupied by white families. For Negroes the proportions were 42 percent and 21 percent respectively. (See table 7 on page 9.) Practically all of the veteran-occupied units with doubled-up families contained one or more married couples in addition to the head of the household while very few contained only married women in addition to the head.

Less than one-half (47.0 percent) of all the private dwelling units in the area were occupied by their owners and slightly more than one-half (52.2 percent) were occupied by tenants. The average (median) monthly contract rent was $53 for private units occupied by white tenants and $35 for those occupied by Negro tenants. (See tables 6 and 7 on page 9.) Among the tenant units containing one or more veterans, the average monthly rental was $51 for units occupied by white families and $36 for those occupied by Negroes. These units were rented by the heads of the households and not necessarily by the veterans themselves.

37711

The proportions of owner-occupied and tenant-occupied dwelling units in November 1946 represent a considerable shift from tenant-occupancy to owner-occupancy since April 1940 when a complete enumeration in the Census of Housing showed that 35.4 percent of all the dwelling units in the metropolitan district were occupied by their owners and 58.6 percent were occupied by tenants.

For the city of Washington alone, the results of the survey indicate a shift from tenant-occupancy to owner-occupancy since April 1940; of the private dwelling units, 38.4 percent were occupied by their owners and 60.8 percent were occupied by tenants in November 1946 as compared with 28.1 percent owner-occupied and 65.6 percent tenant-occupied in April 1940.

Separate figures for the city of Washington are shown in the tables on pages 7, 8, 9, and 10. In general, the results differ only slightly from those for the entire metropolitan district.

TECHNICAL NOTE

The findings presented in this report are based on a sample survey in the Washington, D. C. metropolitan district as defined in the 1940 census. The survey was made in July and August, and supplemented for additional information in November. For dwelling unit occupancy and vacancy characteristics, approximately 5,000 dwelling units were enumerated to represent all sections of the area and all types of residential structures except institutions, publicly financed housing projects, transient hotels, commercial rooming houses, trailers, and tourist cabins. For information on veterans' housing characteristics and intentions, the enumeration was extended to include veterans in all types of residential structures except institutions and transient hotels. Occupancy and vacancy data for publicly financed housing for the Washington locality were obtained from reports of the National Housing Agency as of the end of November.

The number of privately financed dwelling units shown in this report is an estimate based on the weighted sample results and the 1940 census data plus building permit records. The number of World War II veterans shown in this report is an estimate of the number of veterans in the locality exclusive of those in institutions and hotels. This figure was based on the weighted sample results and on an independent estimate derived from the distribution of veterans by state of pre-service residence and the proportion of 1-C Selective Service registrants in the locality. This estimate is only a rough approximation but is the best that can be made from the limited information available.

An examination of the results shows that this survey, like practically all others based upon a field canvass of a cross-section of the population, did not cover a proportionate share of the most mobile parts of the population, e. g., veterans who were traveling about preparatory to taking a job and establishing a residence. In addition, some persons who were actually veterans were not identified as such because of inaccurate or inadequate information furnished by the respondents. The characteristics of such groups may not be the same as those of the enumerated veterans, but in the absence of information concerning these characteristics no adjustment has been made in the results of the survey because of this factor.

The figures presented in this report may differ somewhat from the results which would have been obtained from a complete census because of sampling variability. The following are examples of the magnitude of the sampling variations and the probability of their occurrence for three of the more significant statistics quoted in this report. For the 22 percent of the total veterans who were not employed, the chances are two out of three that the rate which would have been obtained by a complete census is between 19 percent and 25 percent. For the 30 percent of the married white veterans who would like to buy or build a house, the chances are two out of three that the rate which would have been obtained by a complete census is between 26 percent and 34 percent; and for the 79 percent of the married Negro veterans who plan to remain in the area, the chances are two out of three that the rate would have been between 72 percent and 86 percent. Since the sampling variability of any percentage depends not only on the value of the percent, but also on the size of the base on which the percentage is determined, the variations shown in the examples should not be applied indiscriminately to all percentages quoted in this report.

In addition to sampling variability, the estimates are subject to errors of response. Such errors may be expected to affect the sample estimates to about the same degree as they would affect the results of a complete census.

J7711

DEPARTMENT OF COMMERCE
Bureau of the Census

Not to be released until
February 14, 1947

Population: HVet-No. 85

Survey of World War II Veterans and Dwelling Unit Vacancy and Occupancy in the Louisville Area, Kentucky and Indiana

Approximately three-tenths of the married white World War II veterans and one-half of the married Negro veterans in the Louisville area were doubling up with relatives or friends or were living in rented rooms, trailers, or tourist cabins according to the results of a recent sample survey released today by Director J. C. Capt, Bureau of the Census. The survey, made at the request of the National Housing Agency for the Veterans Emergency Housing Program, further showed that one-fourth of the married white veterans and about three-fifths of the married Negro veterans lived in dwelling units which needed major repairs or lacked one or more standard plumbing facilities—running water, private flush toilet, and private bath.

Of the estimated 45,000 World War II veterans living in the Louisville area at the time of the survey, 40,000 were white and 5,000 were Negro. Three-fifths of the white veterans were married and two-fifths were single, widowed, or divorced. Among the Negro veterans, the proportions of married and single were the same as those for the white veterans.

The survey also inquired into the housing plans of all the veterans for the next 12 months. When asked what they would do if housing would be available during the next year only at present prices and quality, 17 percent of the white veterans said they would be in the housing market—10 percent would buy or build a house and 7 percent would move and rent. Of the Negro veterans, 24 percent would be in the housing market—6 percent would buy or build and 18 percent would move and rent.

An additional 22 percent of the white veterans and 25 percent of the Negro veterans would be drawn into the housing market if they could find houses at the price, size, and quality they desire. Under such conditions, a total of 35 percent of the white veterans and 34 percent of the Negro veterans would buy or build a house within the next 12 months; and 4 percent of the white and 15 percent of the Negro veterans would move and rent.

VETERANS' HOUSING PLANS FOR THE NEXT 12 MONTHS

Among the white veterans who would buy or build if houses are available at the price and quality they desire, the average (median) price they reported they would be able to pay for a house was $5,000 and the average (median) gross monthly payment they would be able to make, including payments for real estate taxes, fire insurance, heat, light and cooking fuel, was $40. Their average (median) weekly income from all sources was $48. The average size house they desired was five rooms. Negro veterans who would buy or build under these conditions reported an average price of $3,500, an average monthly payment of $30, and an average weekly income of $32. The average size house Negro veterans desired was five rooms.

Among the white veterans who would move and rent other quarters if they could get what they wanted, the average gross monthly rental they reported they would be able to pay was $40, their average weekly income was $40, and the average size unit they desired was four rooms. For Negro veterans who would move and rent, the average monthly rental reported was $20, their average weekly income was $30, and the average size unit they desired was four rooms.

37713

GENERAL CHARACTERISTICS OF VETERANS

Of the estimated 45,000 veterans living in the Louisville area at the time of the survey, one-sixth (17 percent) were newcomers to the locality since they entered the service. The proportion of in-migrants for married veterans was somewhat higher than the proportion for single veterans. (See table 1 on page 5.)

More than nine-tenths (92 percent) of the married white veterans and two-thirds (67 percent) of the single white veterans were employed. Of the Negro veterans, 84 percent of the married and 58 percent of the single were employed. Veterans in the "other than employed" group included those who did not desire work at the time of the survey as well as those who were seeking employment. About one-half of all the veterans who were not working had been discharged since December 31, 1945.

For all veterans, the average (median) weekly income from all sources was $40. (Average income was based on all veterans, including those who reported having no income.) For employed veterans, the average weekly income was $46. For employed white veterans, weekly incomes averaged $50 for married (including wife's income, if any) and $38 for single veterans; for employed Negro veterans, incomes averaged $32 for married and $29 for single veterans.

PRESENT LIVING ARRANGEMENTS OF VETERANS

Hardship among veterans was partly reflected by the extent to which they were doubling up with relatives or friends or were living in rented rooms, trailers, or tourist cabins. One-fourth (26 percent) of the married white veterans and two-fifths (40 percent) of the married Negro veterans were doubling up in ordinary dwelling units, that is, were living in units which contained, in addition to the head of the household, one or more married couples or married women whose husbands were living elsewhere. Eight percent of the single white veterans as compared with three percent of the married white veterans were living in rented rooms, trailers, or tourist cabins. Among the Negro veterans, the proportion of married veterans living in rented rooms was larger than for the single veterans—14 percent for married and 11 percent for single. (See table 2 on page 5.)

Exclusive of those living in rented rooms, about one-fourth of the total white veterans and slightly more than one-half of the total Negro veterans lived in dwelling units which were in need of major repairs or lacked one or more standard plumbing facilities.

Over two-tenths (22 percent) of the married white and one-tenth (12 percent) of the married Negro veterans owned their homes. (See table 2 on page 5.) About three-fifths of the white and three-fifths of the Negro owners purchased their homes after they were discharged. Over one-half (52 percent) of the married white veterans and two-fifths (41 percent) of the married Negro veterans were renting dwelling units in their names at the time of the survey and were paying an average (median) gross monthly rent of $38 and $19 respectively. Approximately two-thirds of the white veterans and two-fifths of the Negro veterans who were renting acquired their units after they were discharged.

HOUSING PLANS OF VETERANS

More than nine-tenths (94 percent) of the total veterans plan to remain in the Louisville locality for the coming year. Three percent of the veterans plan to leave the locality and three percent are undecided in their plans. (See table 3 on page 6.)

If housing is available during the year only at present prices and quality, 10 out of every 100 white veterans plan to buy or build in the locality, 7 plan to move and rent, 74 plan to remain in their present quarters, and the remaining 9 plan to move into rented rooms or double up, leave the area, or are undecided. Out of every 100 Negro veterans, 6 plan to buy or build, 18 plan to move and rent, 70 plan to remain in their present quarters, and the remaining 6 have other plans.

However, if the veterans could find what they want, 35 out of every 100 white veterans would buy or build a house, 4 would move and rent, and only 52 would remain in their present quarters during the coming year. If the Negro veterans could find what they want, 34 out of every 100 would buy or build a house, 15 would move and rent, and 45 would remain in their present quarters. (See table 5 on page 6.)

37713

For the white veterans who would buy or build if they could find what they want, the average (median) price house they said they could afford was $5,000. About one-fourth of the veterans could pay only $4,000 or less and one-fifth could pay $6,500 or more. Negro veterans desiring to buy or build reported they could afford to pay an average price of $3,500 with one-fourth able to pay only $2,500 or less and one-sixth able to pay $4,500 or more. Nearly three-fifths of the white veterans preferred five-room houses and seven-tenths of the Negro veterans preferred four- or five-room houses. One-half of the white veterans and one-third of the Negro veterans who would buy or build a house have taken some action toward buying or building or have saved money specifically for a house.

Practically all of the prospective home owners would purchase through monthly payments. The gross monthly payments they reported they would be able to make, including real estate taxes, fire insurance, heat, light, and cooking fuel, averaged $40 for white veterans and $30 for Negro veterans. One-sixth of the white veterans planning to buy or build reported they could pay only $30 or less and three-eighths could pay $50 or more. One-sixth of the Negro veterans could pay only $20 or less, and one-sixth could pay $40 or more.

For the veterans who would move and rent if they could find what they want, the average (median) gross monthly rental they reported they would be able to pay, including payments for heat, light, and cooking fuel, was $40 for white and $20 for Negro veterans. Units in single-family structures were preferred by seven-eighths of the white and seven-tenths of the Negro veterans who would like to rent.

AVAILABILITY AND CHARACTERISTICS OF PRESENT HOUSING

In conjunction with the survey of veterans to determine their general characteristics, present living arrangements and housing plans, information on occupancy and vacancy in dwelling units was collected. Tables 6, 7, and 8 on the following pages summarize the availability and characteristics of vacant dwelling units and tenure, rent, facilities, and doubling up in occupied dwelling units.

The survey showed that 1.0 percent of all the dwelling units in the Louisville area including privately and publicly financed dwelling units, were unoccupied. The gross vacancy rate for privately financed dwelling units alone was the same, 1.0 percent—0.9 percent in white neighborhoods and 1.6 percent in Negro neighborhoods. These findings indicate an increase in the number of unoccupied private dwelling units since November 1945 when a similar survey made by the Bureau of Labor Statistics showed a gross vacancy rate of 0.7 percent.

According to the recent survey seven-tenths of the private vacancies were habitable. About one-half of the habitable vacancies were being offered for rent or sale and the remainder were either already rented or sold or were being held off the rental or sale market for other reasons.

Four-fifths (80 percent) of the habitable vacancies were built before 1930, about one-fifth (18 percent) were located in converted structures (structures in which the number of dwelling units has changed since the original construction), over two-fifths (42 percent) had been vacant for one month or longer, seven-tenths (70 percent) were units in single-family structures without business, and the average size was four rooms.

The survey further showed that 9 percent of the privately financed dwelling units in which white veterans lived contained doubled-up families as compared with 21 percent for all private units occupied by white families. For Negroes the proportions were 12 percent and 32 percent respectively. (See table 7 on page 7.) Practically all of the veteran-occupied units with doubled-up families contained one or more married couples in addition to the head of the household while very few contained only married women in addition to the head.

Nearly one-half (48.3 percent) of all the private dwelling units in the Louisville area were occupied by their owners and a slightly higher proportion (50.7 percent) were occupied by tenants. The average (median) monthly contract rent was $31 for private units occupied by white tenants and $12 for those occupied by Negro tenants. Among the tenant units containing one or more veterans, the average monthly rental was $32 for units occupied by white families and $13 for those occupied by Negroes. (See tables 6 and 7 on page 7.) These units were rented by the heads of the households and not necessarily by the veterans themselves.

37213

The proportions of owner-occupied and tenant-occupied dwelling units in November 1946 represent a considerable shift from tenant-occupancy to owner-occupancy since April 1940 when a complete enumeration in the Census of Housing showed that 35.3 percent of all the dwelling units in the area were occupied by their owners and 60.3 percent were occupied by tenants. (The 1940 tenure figures include Louisville, Clarksville, Jeffersonville, and New Albany, and exclude the smaller suburbs. However, the smaller suburbs represent very little of the total survey area.)

TECHNICAL NOTE

The findings presented in this report are based on a sample survey in Louisville and its adjacent built-up area[a] in Kentucky, and Clarksville, Jeffersonville and New Albany in Indiana. The survey was made in August and supplemented for additional information in November. For dwelling unit occupancy and vacancy characteristics, approximately 6,400 dwelling units were enumerated to represent all sections of the area and all types of residential structures except institutions, publicly financed housing projects, transient hotels, commercial rooming houses, trailers, and tourist cabins. For information on veterans' housing characteristics and intentions, the enumeration was extended to include veterans in all types of residential structures except institutions and transient hotels. Occupancy and vacancy data for publicly financed housing for the Louisville locality were obtained from reports of the National Housing Agency as of the end of November.

The number of privately financed dwelling units shown in this report for the Louisville area is an estimate based on the weighted sample results and the 1940 census data plus building permit records. The number of World War II veterans shown in this report is an estimate of the number of veterans in the locality exclusive of those in institutions and hotels. This figure was based on the weighted sample results and on an independent estimate derived from the distribution of veterans by state of preservice residence and the proportion of 1-C Selective Service registrants in the locality. This estimate is only a rough approximation but is the best that can be made from the limited information available.

An examination of the results shows that this survey, like practically all others based upon a field canvass of a cross-section of the population, did not cover a proportionate share of the most mobile parts of the population, e.g. veterans who were traveling about preparatory to taking a job and establishing a residence. In addition, some persons who were actually veterans were not identified as such because of inaccurate or inadequate information furnished by the respondents. The characteristics of such groups may not be the same as those of the enumerated veterans, but in the absence of information concerning these characteristics no adjustment has been made in the results of the survey because of this factor.

The figures presented in this report may differ somewhat from the results which would have been obtained by a complete census because of sampling variability. The following are examples of the magnitude of the sampling variations and the probability of their occurrence for three of the more significant statistics quoted in this report. For the 34 percent of the total veterans who would like to buy or build a house, the chances are two out of three that the rate which would have been obtained by a complete census is between 32 percent and 36 percent. For the 26 percent of the married white veterans who were living doubled up, the chances are two out of three that the rate which would have been obtained by a complete census is between 24 percent and 28 percent; and for the 40 percent of the married Negro veterans who were living doubled up, the chances are two out of three that the rate would have been between 35 percent and 45 percent. Since the sampling variability of any percentage depends not only on the value of the percent, but also on the size of the base on which the percentage is determined, the variations shown in the examples should not be applied indiscriminately to all percentages quoted in this report.

In addition to sampling variability, the estimates are subject to errors of response. Such errors may be expected to affect the sample estimates to about the same degree as they would affect the results of a complete census.

[a] The adjacent built-up area included Audubon Park, Iroquois Park, Kingsley, Parkway Village, Seneca Gardens, St. Matthew, Strathmoor Manor, and Strathmoor Village.

DEPARTMENT OF COMMERCE
Bureau of the Census

Population: HVet- No. 97

Survey of World War II Veterans and Dwelling Unit Vacancy and Occupancy in the Chattanooga Area, Tennessee

Approximately three out of ten married white World War II veterans and three out of eight married Negro veterans in the Chattanooga area were doubling up with relatives or friends or were living in rented rooms, trailers, or tourist cabins according to the results of a sample survey released today by Director J. C. Capt, Bureau of the Census. The survey, made during December at the request of the National Housing Agency for the Veterans Emergency Housing Program, further showed that about one-fourth of the married white veterans and two-thirds of the married Negro veterans lived in dwelling units which needed major repairs or lacked one or more standard plumbing facilities--running water, private flush toilet, and private bath.

Of the estimated 14,000 World War II veterans living in the area at the time of the survey, 11,900 were white and 2,100 were Negro. About seven-tenths of the white veterans were married and three-tenths were single, widowed, or divorced. Among the Negro veterans, slightly more than six-tenths were married.

The survey also inquired into the housing plans of all the veterans for the next 12 months. When asked what they would do if housing would be available during the next year only at present prices and quality, 18 percent of the white veterans said they would be in the housing market—9 percent would buy or build a house and 9 percent would move and rent. Of the Negro veterans, 21 percent would be in the housing market—8 percent would buy or build and 13 percent would move and rent.

An additional 26 percent of the white veterans and 19 percent of the Negro veterans would be drawn into the housing market if they could find houses at the price, size, and quality they desire. Under such conditions, a total of 38 percent of the white veterans and 29 percent of the Negro veterans would buy or build a house within the next 12 months; and 6 percent of the white and 11 percent of the Negro veterans would move and rent.

VETERANS' HOUSING PLANS FOR THE NEXT 12 MONTHS

Of those who plan to buy or build in the present market, the white veterans indicated they are able to pay an average (median) price of $4,000 and Negro veterans reported they are able to pay $2,500.

Among the white veterans who would buy or build if houses are available at the price and quality they desire, the average (median) price they reported they would be able to pay for a house was $4,000 and the average (median) gross monthly payment they would be able to make, including real estate taxes, fire insurance, heat, light, and cooking fuel, was $40. Their average (median) weekly income from all sources was $49. The average size house they desired was five rooms. Negro veterans who would buy or build under these conditions reported an average price of $2,500, an average monthly payment of $30, and an average weekly income of $32. The average size house Negro veterans desired was four rooms.

Among the white veterans who would move and rent other quarters if they could get what they wanted, the average gross monthly rental they reported they would be able to pay was $30, their average weekly income was $38, and the average size unit they desired was four rooms. For Negro veterans who would move and rent, the average monthly rental reported was $20, their average weekly income was $31, and the average size unit they desired was four rooms.

380/6

GENERAL CHARACTERISTICS OF VETERANS

Of the estimated 14,000 veterans living in the Chattanooga area at the time of the survey, about one-sixth (17 percent) were newcomers to the locality since they entered the service. The proportion of in-migrants for married veterans was considerably higher than the proportion for single veterans. (See table 1 on page 5.)

Over nine-tenths (92 percent) of the married white veterans and nearly two-thirds (65 percent) of the single white veterans were employed. Of the Negro veterans, 90 percent of the married and 68 percent of the single were employed. Veterans in the "other than employed" group included those who did not desire work at the time of the survey as well as those who were seeking employment. One-half of all the veterans who were not working had been discharged since December 31, 1945.

For all veterans, the average (median) weekly income from all sources was $42. (Average income was based on all veterans, including those who reported having no income.) For employed veterans, the average weekly income was $46. For employed white veterans, weekly incomes averaged $51 for married (including wife's income, if any) and $39 for single veterans; for employed Negro veterans, incomes averaged $33 for married and $31 for single veterans.

PRESENT LIVING ARRANGEMENTS OF VETERANS

Hardship among veterans was partly reflected by the extent to which they were doubling up with relatives or friends or were living in rented rooms, trailers, or tourist cabins. One-fourth (24 percent) of the married white veterans and three-tenths (30 percent) of the married Negro veterans were doubling up in ordinary dwelling units, that is, were living in units which contained, in addition to the head of the household, one or more married couples or married women whose husbands were living elsewhere. Fifteen percent of the single white veterans as compared with four percent of the married white veterans were living in rented rooms, trailers, or tourist cabins. For the Negro veterans, these proportions were fourteen percent for the single and six percent for the married. (See table 2 on page 5.)

Exclusive of those living in rented rooms, about one-fifth of the total white veterans and three-fifths of the total Negro veterans lived in dwelling units which were in need of major repairs or lacked one or more standard plumbing facilities.

One-fourth (24 percent) of the married white and one-tenth (11 percent) of the married Negro veterans owned their homes. (See table 2 on page 5.) About three-fifths of the white and slightly more than one-half of the Negro owners purchased their homes after they were discharged. More than one-half (55 percent) of the married white veterans and about the same proportion (54 percent) of the married Negro veterans were renting dwelling units in their names at the time of the survey and were paying an average (median) gross monthly rent of $32 and $22 respectively. Nearly three-fifths of the white veterans and slightly less than one-half of the Negro veterans who were renting acquired their units after they were discharged.

HOUSING PLANS OF VETERANS

Nine-tenths (90 percent) of the total veterans plan to remain in the Chattanooga locality for the coming year. Five percent of the veterans plan to leave the locality and five percent are undecided in their plans. (See table 3 on page 6.)

If housing is available during the year only at present prices and quality, 9 out of every 100 white veterans plan to buy or build in the locality, 9 plan to move and rent, 71 plan to remain in their present quarters, and the remaining 11 plan to move into rented rooms or double up, leave the area, or are undecided. Out of every 100 Negro veterans, 8 plan to buy or build, 13 plan to move and rent, 69 plan to remain in their present quarters, and the remaining 10 have other plans.

However, if the veterans could find what they want, 38 out of every 100 white veterans would buy or build a house, 6 would move and rent, and only 45 would remain in their present quarters during the coming year. If the Negro veterans could find what they want, 29 out of every 100 would buy or build a house, 11 would move and rent, and 50 would remain in their present quarters. (See table 5 on page 6.)

38016

For the white veterans who would buy or build if they could find what they want, the average (median) price house they said they could afford was $4,000. One-eighth of the veterans could pay less than $3,000 and only one-fifth could pay more than $5,500. Negro veterans desiring to buy or build reported they could afford to pay an average price of $2,500 with one-tenth able to pay less than $2,000 and one-fifth more than $3,000. Nearly four-fifths of the white veterans preferred five- or six-room houses and about nine-tenths of the Negro veterans preferred four- or five-room houses. Approximately one-half of the white veterans and three-eighths of the Negro veterans who would buy or build a house have taken some action toward buying or building or have saved money specifically for a house.

Practically all of the prospective home owners would purchase through monthly payments. The gross monthly payments they reported they would be able to make, including real estate taxes, fire insurance, heat, light, and cooking fuel, averaged $40 for white veterans and $30 for Negro veterans. One-fifth of the white veterans planning to buy or build reported they could pay less than $31 and one-sixth could pay more than $50. One-sixth of the Negro veterans reported they could pay less than $25 and one-fifth more than $35.

For the white veterans who would move and rent if they could find what they want, the average (median) gross monthly rental they reported they would be able to pay, including payments for heat, light, and cooking fuel, was $30. One-eighth of the veterans could pay less than $25 and one-fourth could pay more than $40. Of the Negro veterans who would move and rent if they could find what they want, the average (median) rental they reported they would be able to pay was $20. One-fifth could pay less than $17 and one-fifth could pay more than $25. Units in single-family structures were preferred by four-fifths of all the veterans who would like to rent.

AVAILABILITY AND CHARACTERISTICS OF PRESENT HOUSING

In conjunction with the survey of veterans, information on occupancy and vacancy in dwelling units was collected. Tables 6, 7, and 8 on the following pages summarize the availability and characteristics of vacant dwelling units and tenure, rent, facilities, and doubling-up in occupied dwelling units.

The survey showed that 0.5 percent of all the dwelling units in the Chattanooga area including privately and publicly financed dwelling units, were unoccupied. The gross vacancy rate for privately financed dwelling units alone was 0.4 percent. Practically all of the private vacancies in the area were habitable; of these, approximately one-eighth lacked installed cooking facilities. About one-half of the habitable vacancies were being offered for rent or sale and the remainder were either already rented or sold or were being held off the rental or sale market for other reasons.

One-half (50 percent) of the habitable vacancies were built before 1920, one-fifth (21 percent) lacked one or more standard plumbing facilities, three-eighths (38 percent) had been vacant for one month or longer, seven-tenths (69 percent) were units in single-family structures without business, and the average size was five rooms.

The survey further showed that 21 percent of the privately financed dwelling units in which white veterans lived contained doubled-up families as compared with 11 percent for all private units occupied by white families. For Negroes the proportions were 26 percent and 11 percent respectively. (See table 7 on page 7.) Practically all of the veteran-occupied units with doubled-up families contained one or more married couples in addition to the head of the household while very few contained only married women in addition to the head.

Almost one-half (46.9 percent) of all the private dwelling units in the Chattanooga area were occupied by their owners and a slightly higher proportion (52.7 percent) were occupied by tenants. The average (median) monthly contract rent was $25 for private units occupied by white tenants and $13 for those occupied by Negro tenants. (See tables 6 and 7 on page 7.) Among the tenant units containing one or more veterans, the average monthly rental was $25 for units occupied by white families and $14 for those occupied by Negroes. These units were rented by the heads of the households and not necessarily by the veterans themselves.

The proportions of owner-occupied and tenant-occupied dwelling units in December 1946 represent a considerable shift from tenant-occupancy to owner-occupancy since April 1940 when a complete enumeration in the Census of Housing showed that 27.8 percent of all the dwelling units in the area were occupied by their owners and 69.6 percent were occupied by tenants.

38016

TECHNICAL NOTE

The findings presented in this report are based on a sample survey in Chattanooga city and East Ridge town, Tennessee, and Rossville city, Georgia. For dwelling unit occupancy and vacancy characteristics, approximately 7,700 dwelling units were enumerated to represent all sections of the area and all types of residential structures except institutions, publicly financed housing projects, transient hotels, commercial rooming houses, trailers, and tourist cabins. For information on veterans' housing characteristics and intentions, the enumeration was extended to include veterans in all types of residential structures except institutions and transient hotels. Occupancy and vacancy data for publicly financed housing for the Chattanooga locality were obtained from reports of the National Housing Agency as of the end of November.

The number of privately financed dwelling units shown in this report for the area is an estimate based on the weighted sample results and the 1940 census data plus building permit records. The number of World War II veterans shown in this report is an estimate of the number of veterans in the locality exclusive of those in institutions and hotels. This figure was based on the weighted sample results and on an independent estimate derived from the distribution of veterans by state of preservice residence and the proportion of 1-C Selective Service registrants in the locality. This estimate is only a rough approximation but is the best that can be made from the limited information available.

An examination of the results shows that this survey, like practically all others based upon a field canvass of a cross-section of the population, did not cover a proportionate share of the most mobile parts of the population, e.g., veterans who were traveling about preparatory to taking a job and establishing a residence. In addition, some persons who were actually veterans were not identified as such because of inaccurate or inadequate information furnished by the respondents. The characteristics of such groups may not be the same as those of the enumerated veterans, but in the absence of information concerning these characteristics no adjustment has been made in the results of the survey because of this factor.

The figures presented in this report may differ somewhat from the results which would have been obtained by a complete census because of sampling variability. In general, the allowance to be made for sampling variation depends both on the numerical value of the percentage and the size of the base on which the percentage is determined, a percentage based on a larger number of dwelling units or veterans being less variable than one based on a smaller number. For example, in at least two out of three instances, almost all of the estimated percentages based on total veterans (column 1 of tables 1 through 5) may be expected to be not more than two percentage points larger or smaller than the percentages which would have been obtained if a complete census had been taken. Almost all of the percentages based on married white veterans are subject to an allowance of plus or minus two percentage points while those based on married Negro veterans are subject to an allowance of plus or minus three percentage points. Thus for the 37 percent of the total veterans who would like to buy or build a house it may be expected that the proportion which would have been obtained by a complete census would have been between 35 percent and 39 percent; for the 14 percent of the married white veterans who were living doubled up, the proportion would have been between 12 percent and 16 percent.

In addition to sampling variability, the estimates are subject to errors of response. Such errors may be expected to affect the sample estimates to about the same degree as they would affect the results of a complete census.

One-fourth of the units rented for more than	$39	$40	([3])	$26	([3])

[1] For purposes of this survey, a veteran was considered as living doubled-up if he lived in a dwelling unit which contained more than one family, that is, the unit contained, in addition to the head of the household, married couples or married women with husbands absent.

[2] Standard plumbing facilities included running water in the unit, private flush toilet in the structure, and private installed bathtub or shower in the structure.

[3] There were too few single veterans in the sample who rented their dwelling units to quote average monthly rental.

DEPARTMENT OF COMMERCE
Bureau of the Census

Population: HVet-No. 99

Survey of World War II Veterans and Dwelling Unit Vacancy and Occupancy in the Columbia Area, South Carolina

Approximately two out of five married white World War II veterans and two out of five married Negro veterans in the Columbia area were doubling up with relatives or friends or were living in rented rooms, trailers, or tourist cabins according to the results of a sample survey released today by Director J. C. Capt, Bureau of the Census. The survey, made during December at the request of the National Housing Agency for the Veterans Emergency Housing Program, further showed that about one-tenth of the married white veterans and one-half of the married Negro veterans lived in dwelling units which needed major repairs or lacked one or more standard plumbing facilities—running water, private flush toilet, and private bath.

Of the estimated 5,000 World War II veterans living in the area at the time of the survey, 4,000 were white and 1,000 were Negro. Five-eighths of the white veterans were married and three-eighths were single, widowed, or divorced. Among the Negro veterans, three-fifths were married.

The survey also inquired into the housing plans of all the veterans for the next 12 months. When asked what they would do if housing would be available during the next year only at present prices and quality, 10 percent of the white veterans said they would be in the housing market--7 percent would buy or build a house and 3 percent would move and rent. Of the Negro veterans, 13 percent would be in the housing market—8 percent would buy or build and 5 percent would move and rent.

An additional 12 percent of the white veterans and 13 percent of the Negro veterans would be drawn into the housing market if they could find houses at the price, size, and quality they desire. Under such conditions, a total of 20 percent of the white veterans and 22 percent of the Negro veterans would buy or build a house within the next 12 months; and 2 percent of the white and 4 percent of the Negro veterans would move and rent.

VETERANS' HOUSING PLANS FOR THE NEXT 12 MONTHS

Of those who plan to buy or build in the present market, the white veterans indicated they are able to pay an average (median) price of $6,000 and Negro veterans reported they are able to pay $4,000.

Among the white veterans who would buy or build if houses are available at the price and quality they desire, the average (median) price they reported they would be able to pay for a house was $6,000 and the average (median) gross monthly payment they would be able to make, including real estate taxes, fire insurance, heat, light, and cooking fuel, was $50. Their average (median) weekly income from all sources was $54. The average size house they desired was six rooms. Negro veterans who would buy or build under these conditions reported an average price of $3,500, an average monthly payment of $25, and an average weekly income of $30. The average size house Negro veterans desired was five rooms.

Among the white veterans who would move and rent other quarters if they could get what they wanted, the average gross monthly rental they reported they would be able to pay was $40, their average weekly income was $43, and the average size unit they desired was four rooms. For Negro veterans who would move and rent, the average monthly rental reported was $20, their average weekly income was $28, and five-sixths desired four- or five-room units.

380 2/

GENERAL CHARACTERISTICS OF VETERANS

Of the estimated 5,000 veterans living in the Columbia area at the time of the survey, nearly one-fourth (23 percent) were newcomers to the locality since they entered the service. The proportion of in-migrants for married veterans was considerably higher than the proportion for single veterans. (See table 1 on page 5.)

Almost seven-eighths (86 percent) of the married white veterans and almost three-fifths (57 percent) of the single white veterans were employed. Of the Negro veterans, 67 percent of the married and 38 percent of the single were employed. Veterans in the "other than employed" group included those who did not desire work at the time of the survey as well as those who were seeking employment. Three-fifths of all the veterans who were not working had been discharged since December 31, 1945.

For all veterans, the average (median) weekly income from all sources was $38. (Average income was based on all veterans, including those who reported having no income.) For employed veterans, the average weekly income was $46. For employed white veterans, weekly incomes averaged $53 for married (including wife's income, if any) and $37 for single veterans; for employed Negro veterans, incomes averaged $30 for married and $28 for single veterans.

PRESENT LIVING ARRANGEMENTS OF VETERANS

Hardship among veterans was partly reflected by the extent to which they were doubling up with relatives or friends or were living in rented rooms, trailers, or tourist cabins. About three-tenths (28 percent) of the married white veterans and one-fourth (26 percent) of the married Negro veterans were doubling up in ordinary dwelling units, that is, were living in units which contained, in addition to the head of the household, one or more married couples or married women whose husbands were living elsewhere. Thirty percent of the single white veterans as compared with twelve percent of the married white veterans were living in rented rooms, trailers, or tourist cabins. For the Negro veterans, these proportions were 33 percent for the single and 14 percent for the married. (See table 2 on page 5.)

Exclusive of those living in rented rooms, about seven percent of the total white veterans and forty-six percent of the total Negro veterans lived in dwelling units which were in need of major repairs or lacked one or more standard plumbing facilities.

About one-fourth (23 percent) of the married white and almost one-tenth (9 percent) of the married Negro veterans owned their homes. (See table 2 on page 5.) Nearly one-half of the white and three-tenths of the Negro owners purchased their homes after they were discharged. Slightly more than two-fifths (43 percent) of the married white veterans and almost three-fifths (57 percent) of the married Negro veterans were renting dwelling units in their names at the time of the survey and were paying an average (median) gross monthly rent of $47 and $18 respectively. Seven-tenths of the white veterans and about one-half of the Negro veterans who were renting acquired their units after they were discharged.

HOUSING PLANS OF VETERANS

Nine-tenths (91 percent) of the total veterans plan to remain in the Columbia locality for the coming year. Four percent of the veterans plan to leave the locality and five percent are undecided in their plans. (See table 3 on page 6.)

If housing is available during the year only at present prices and quality, 7 out of every 100 white veterans plan to buy or build in the locality, 3 plan to move and rent, 80 plan to remain in their present quarters, and the remaining 10 plan to move into rented rooms or double up, leave the area, or are undecided. Out of every 100 Negro veterans, 8 plan to buy or build, 5 plan to move and rent, 80 plan to remain in their present quarters, and the remaining 7 have other plans.

However, if the veterans could find what they want, 20 out of every 100 white veterans would buy or build a house, 2 would move and rent, and only 68 would remain in their present quarters during the coming year. If the Negro veterans could find what they want, 22 out of every 100 would buy or build a house, 4 would move and rent, and 67 would remain in their present quarters. (See table 5 on page 6.)

380 21

For the white veterans who would buy or build if they could find what they want, the average (median) price house they said they could afford was $6,000. Three-tenths of the white veterans could pay less than $5,100, and one-fifth could pay more than $8,000. Negro veterans desiring to buy or build reported they could afford to pay an average price of $3,500 with one-fifth able to pay less than $2,600 and one-eighth more than $5,000. Four-fifths of the white veterans preferred five- or six-room houses and three-fourths of the Negro veterans preferred four- or five-room houses. Four-fifths of the white veterans and three-fifths of the Negro veterans who would buy or build a house have taken some action toward buying or building or have saved money specifically for a house.

Practically all of the prospective home owners would purchase through monthly payments. The gross monthly payments they reported they would be able to make, including real estate taxes, fire insurance, heat, light, and cooking fuel, averaged $50 for white veterans and $25 for Negro veterans. One-fourth of the white veterans planning to buy or build reported they could pay less than $36 and one-fourth could pay more than $55. Three-tenths of the Negro veterans reported they could pay less than $23 and two-tenths could pay more than $30.

For the veterans who would move and rent if they could find what they want, the average (median) gross monthly rental they reported they would be able to pay, including payments for heat, light, and cooking fuel, was $40 for white and $20 for Negro veterans. Two-thirds of the white veterans could pay amounts ranging from $35 through $50 and one-half of the Negro veterans could pay from $15 through $25. Units in single-family structures were preferred by five-sixths of all the veterans who would like to rent.

AVAILABILITY AND CHARACTERISTICS OF PRESENT HOUSING

In conjunction with the survey of veterans to determine their general characteristics, present living arrangements and housing plans, information on occupancy and vacancy in dwelling units was collected. Tables 6, 7, and 8 on the following pages summarize the availability and characteristics of vacant dwelling units and tenure, rent, facilities, and doubling-up in occupied dwelling units.

The survey showed that 0.8 percent of all the dwelling units in the Columbia area including privately and publicly financed dwelling units, were unoccupied. The gross vacancy rate for privately financed dwelling units alone was 0.5 percent--in white neighborhoods, 0.6 percent, and in Negro neighborhoods, 0.2 percent.

About four-fifths of the private vacancies were habitable; of these, two-thirds lacked installed cooking facilities. One-half of the habitable vacancies were being offered for rent or sale and the remainder were either already rented or sold or were being held off the rental or sale market for other reasons.

More than one-third (36 percent) of the habitable vacancies were built before 1930, about one-tenth (11 percent) were located in converted structures (structures in which the number of dwelling units has changed since the original construction), nine-tenths (89 percent) were units in single-family structures without business, and the average size was five rooms.

The survey further showed that 27 percent of the privately financed dwelling units in which white veterans lived contained doubled-up families as compared with 13 percent for all private units occupied by white families. For Negroes the proportions were 27 percent and 9 percent respectively. (See table 7 on page 7.) Practically all of the veteran-occupied units with doubled-up families contained one or more married couples in addition to the head of the household while very few contained only married women in addition to the head.

Over two-fifths (42.4 percent) of all the private dwelling units in the Columbia area were occupied by their owners and almost three-fifths (57.1 percent) were occupied by tenants. The average (median) monthly contract rent was $38 for private units occupied by white tenants and $12 for those occupied by Negro tenants. (See tables 6 and 7 on page 7.) Among the tenant units containing one or more veterans, the average monthly rental was $39 for units occupied by white families and $13 for those occupied by Negroes. These units were rented by the heads of the households and not necessarily by the veterans themselves.

38021

The proportions of owner-occupied and tenant-occupied dwelling units in December 1946 represent a considerable shift from tenant-occupancy to owner-occupancy since April 1940 when a complete enumeration in the Census of Housing showed that 27.5 percent of all the dwelling units in the area were occupied by their owners and 70.0 percent were occupied by tenants.

TECHNICAL NOTE

The findings presented in this report are based on a sample survey in Columbia city and Eau Claire town. For dwelling unit occupancy and vacancy characteristics, approximately 7,200 dwelling units were enumerated to represent all sections of the area and all types of residential structures except institutions, publicly financed housing projects, transient hotels, commercial rooming houses, trailers, and tourist cabins. For information on veterans' housing characteristics and intentions, the enumeration was extended to include veterans in all types of residential structures except institutions and transient hotels. Occupancy and vacancy data for publicly financed housing for the Columbia locality were obtained from reports of the National Housing Agency as of the end of November.

The number of privately financed dwelling units shown in this report for the area is an estimate based on the weighted sample results and the 1940 census data plus building permit records. The number of World War II veterans shown in this report is an estimate of the number of veterans in the locality exclusive of those in institutions and hotels. This figure was based on the weighted sample results and on an independent estimate derived from the distribution of veterans by state of preservice residence and the proportion of 1-C Selective Service registrants in the locality. This estimate is only a rough approximation but is the best that can be made from the limited information available.

An examination of the results shows that this survey, like practically all others based upon a field canvass of a cross-section of the population, did not cover a proportionate share of the most mobile parts of the population, e.g., veterans who were traveling about preparatory to taking a job and establishing a residence. In addition, some persons who were actually veterans were not identified as such because of inaccurate or inadequate information furnished by the respondents. The characteristics of such groups may not be the same as those of the enumerated veterans, but in the absence of information concerning these characteristics no adjustment has been made in the results of the survey because of this factor.

The figures presented in this report may differ somewhat from the results which would have been obtained by a complete census because of sampling variability. In general, the allowance to be made for sampling variation depends both on the numerical value of the percentage and the size of the base on which the percentage is determined, a percentage based on a larger number of dwelling units or veterans being less variable than one based on a smaller number. For example, in at least two out of three instances, almost all of the estimated percentages based on total veterans (column 1 of tables 1 through 5) may be expected to be not more than two percentage points larger or smaller than the percentages which would have been obtained if a complete census had been taken. Almost all of the percentages based on married white veterans are subject to an allowance of plus or minus two percentage points while those based on married Negro veterans are subject to an allowance of plus or minus three percentage points. Thus for the 20 percent of the total veterans who would like to buy or build a house it may be expected that the proportion which would have been obtained by a complete census would have been between 18 percent and 22 percent; for the 26 percent of the married Negro veterans who were living doubled up, the proportion would have been between 23 percent and 29 percent.

In addition to sampling variability, the estimates are subject to errors of response. Such errors may be expected to affect the sample estimates to about the same degree as they would affect the results of a complete census.

DEPARTMENT OF COMMERCE
Bureau of the Census

Population: HVet-No. 100

Survey of World War II Veterans and Dwelling Unit Vacancy and Occupancy in Waco, Tex.

Approximately one out of five married white World War II veterans and three out of ten married Negro veterans in Waco were doubling up with relatives or friends or were living in rented rooms, trailers, or tourist cabins according to the results of a sample survey released today by Director J. C. Capt, Bureau of the Census. The survey, made during December at the request of the National Housing Agency for the Veterans Emergency Housing Program, further showed that about one-seventh of the married white veterans and three-fifths of the married Negro veterans lived in dwelling units which needed major repairs or lacked one or more standard plumbing facilities--running water, private flush toilet, and private bath.

Of the estimated 6,000 World War II veterans living in Waco at the time of the survey, 5,100 were white and 900 were Negro. Seven-tenths of the white veterans were married and three-tenths were single, widowed, or divorced. Among the Negro veterans, two-thirds were married.

The survey also inquired into the housing plans of all the veterans for the next 12 months. When asked what they would do if housing would be available during the next year only at present prices and quality, 13 percent of the white veterans said they would be in the housing market--8 percent would buy or build a house and 5 percent would move and rent. Of the Negro veterans, 11 percent would be in the housing market--9 percent would buy or build and 2 percent would move and rent.

An additional 18 percent of the white veterans and 16 percent of the Negro veterans would be drawn into the housing market if they could find houses at the price, size, and quality they desire. Under such conditions, a total of 27 percent of the white veterans and 24 percent of the Negro veterans would buy or build a house within the next 12 months; and 4 percent of the white and 3 percent of the Negro veterans would move and rent.

VETERANS' HOUSING PLANS FOR THE NEXT 12 MONTHS

Of those who plan to buy or build in the present market, the white veterans indicated they are able to pay an average (median) price of $5,000 and Negro veterans reported they are able to pay $2,000.

Among the white veterans who would buy or build if houses are available at the price and quality they desire, the average (median) price they reported they would be able to pay for a house was $5,000 and the average (median) gross monthly payment they would be able to make, including real estate taxes, fire insurance, heat, light, and cooking fuel, was $40. Their average (median) weekly income from all sources was $49. The average size house they desired was five rooms. Negro veterans who would buy or build under these conditions reported an average price of $2,000, an average monthly payment of $25, and an average weekly income of $28. The average size house Negro veterans desired was five rooms.

Among the white veterans who would move and rent other quarters if they could get what they wanted, the average gross monthly rental they reported they would be able to pay was $35, their average weekly income was $37, and the average size unit they desired was four rooms. For Negro veterans who would move and rent, the average monthly rental reported was $18, and the average size unit they desired was four rooms. Five-sixths of these Negro veterans had incomes ranging from $20 to $40 weekly.

38078

GENERAL CHARACTERISTICS OF VETERANS

Of the estimated 6,000 veterans living in Waco at the time of the survey, one-fourth (24 percent) were newcomers to the locality since they entered the service. The proportion of in-migrants for married veterans was considerably higher than the proportion for single veterans. (See table 1 on page 5.)

Seven-eighths (87 percent) of the married white veterans and one-half (50 percent) of the single white veterans were employed. Of the Negro veterans, 67 percent of the married and 45 percent of the single were employed. Veterans in the "other than employed" group included those who did not desire work at the time of the survey as well as those who were seeking employment. One-half of all the veterans who were not working had been discharged since December 31, 1945.

For all veterans, the average (median) weekly income from all sources was $38. (Average income was based on all veterans, including those who reported having no income.) For employed veterans, the average weekly income was $46. For employed white veterans, weekly incomes averaged $52 for married (including wife's income, if any) and $38 for single veterans; for employed Negro veterans, incomes averaged $29 for married and $26 for single veterans.

PRESENT LIVING ARRANGEMENTS OF VETERANS

Hardship among veterans was partly reflected by the extent to which they were doubling up with relatives or friends. One-fifth (19 percent) of the married white veterans and three-tenths (29 percent) of the married Negro veterans were doubling up in ordinary dwelling units, that is, were living in units which contained, in addition to the head of the household, one or more married couples or married women whose husbands were living elsewhere. Exclusive of veterans living in rented rooms, about one-eighth of the total white veterans and three-fifths of the total Negro veterans lived in dwelling units which were in need of major repairs or lacked one or more standard plumbing facilities. (See table 2 on page 5.)

Over one-third (35 percent) of the married white and three-tenths (29 percent) of the married Negro veterans owned their homes. (See table 2 on page 5.) About three-fifths of the white and one-fourth of the Negro owners purchased their homes after they were discharged. Almost one-half (48 percent) of the married white veterans and one-half (49 percent) of the married Negro veterans were renting dwelling units in their names at the time of the survey and were paying an average (median) gross monthly rent of $33 and $17 respectively. About four-fifths of the white veterans and three-fifths of the Negro veterans who were renting acquired their units after they were discharged.

HOUSING PLANS OF VETERANS

Nine-tenths (90 percent) of the total veterans plan to remain in the Waco locality for the coming year. Five percent of the veterans plan to leave the locality and five percent are undecided in their plans. (See table 3 on page 6.)

If housing is available during the year only at present prices and quality, 8 out of every 100 white veterans plan to buy or build in the locality, 5 plan to move and rent, 78 plan to remain in their present quarters, and the remaining 9 plan to move into rented rooms or double up, leave the area, or are undecided. Out of every 100 Negro veterans, 9 plan to buy or build, 2 plan to move and rent, 77 plan to remain in their present quarters, and the remaining 12 have other plans.

However, if the veterans could find what they want, 27 out of every 100 white veterans would buy or build a house, 4 would move and rent, and only 60 would remain in their present quarters during the coming year. (See table 5 on page 6.) If the Negro veterans could find what they want, 24 out of every 100 would buy or build a house, 3 would move and rent, and 61 would remain in their present quarters.

For the white veterans who would buy or build if they could find what they want, the average (median) price house they said they could afford was $5,000. One-fourth of the veterans could pay less than $4,000 and only one-sixth could pay more than $6,000. Negro veterans

J8078

desiring to buy or build reported they could afford to pay an average price of $2,000 with one-fourth able to pay less than $1,700 and one-sixth more than $3,000. Four-fifths of the white veterans preferred five- or six-room houses and three-fourths of the Negro veterans preferred four- or five-room houses. About one-half of the white veterans and one-third of the Negro veterans who would buy or build a house have taken some action toward buying or building or have saved money specifically for a house.

Practically all of the prospective home owners would purchase through monthly payments. The gross monthly payments they reported they would be able to make, including real estate taxes, fire insurance, heat, light, and cooking fuel, averaged $40 for white veterans and $25 for Negro veterans. Three-tenths of the white veterans planning to buy or build reported they could pay less than $33 and three-tenths could pay more than $45. One-sixth of the Negro veterans could pay less than $20 and only one-tenth could pay more than $30.

For the veterans who would move and rent if they could find what they want, the average (median) gross monthly rental they reported they would be able to pay, including payments for heat, light, and cooking fuel, was $35 for white and $18 for Negro veterans. One-fourth of the white veterans reported they could pay less than $26 and one-fifth could pay more than $40. One-fourth of the Negro veterans could pay less than $13 and three-tenths more than $20. Units in single-family structures were preferred by seven-tenths of all the veterans who would like to rent.

AVAILABILITY AND CHARACTERISTICS OF PRESENT HOUSING

In conjunction with the survey of veterans, information on occupancy and vacancy in dwelling units was collected. Tables 6, 7, and 8 on the following pages summarize the availability and characteristics of vacant dwelling units and tenure, rent, facilities, and doubling up in occupied dwelling units.

The survey showed that 1.0 percent of all the dwelling units in Waco, including privately and publicly financed dwelling units, were unoccupied. The gross vacancy rate for privately financed dwelling units alone was the same, 1.0 percent—in white neighborhoods, 1.1 percent, and in Negro neighborhoods, 0.8 percent.

About nine-tenths of the private vacancies were habitable; of these, one-fourth lacked installed cooking facilities. Almost four-fifths of the habitable vacancies were being offered for rent or sale and the remainder were either already rented or sold or were being held off the rental or sale market for other reasons.

Three-tenths (29 percent) of the habitable vacancies were built before 1930, more than three-tenths (32 percent) had been vacant for one month or longer, one-sixth (17 percent) lacked one or more standard plumbing facilities, and the average size was five rooms.

The survey further showed that 15 percent of the privately financed dwelling units in which white veterans lived contained doubled-up families as compared with 6 percent for all private units occupied by white families. For Negroes the proportions were 24 percent and 8 percent respectively. (See table 7 on page 7.) Practically all of the veteran-occupied units with doubled-up families contained one or more married couples in addition to the head of the household while very few contained only married women in addition to the head.

Three-fifths (60.3 percent) of all the private dwelling units in Waco were occupied by their owners and almost two-fifths (38.7 percent) were occupied by tenants. The average (median) monthly contract rent was $27 for private units occupied by white tenants and $11 for those occupied by Negro tenants. (See tables 6 and 7 on page 7.) Among the tenant units containing one or more veterans, the average monthly rental was $28 for units occupied by white families and $12 for those occupied by Negroes. These units were rented by the heads of the households and not necessarily by the veterans themselves.

The proportions of owner-occupied and tenant-occupied dwelling units in December 1946 represent a considerable shift from tenant-occupancy to owner-occupancy since April 1940 when a complete enumeration in the Census of Housing showed that 34.7 percent of all the dwelling units in the city were occupied by their owners and 59.8 percent were occupied by tenants.

38078

TECHNICAL NOTE

The findings presented in this report are based on a sample survey in the city of Waco. For dwelling unit occupancy and vacancy characteristics, approximately 7,100 dwelling units were enumerated to represent all sections of the city and all types of residential structures except institutions, publicly financed housing projects, transient hotels, commercial rooming houses, trailers, and tourist cabins. For information on veterans' housing characteristics and intentions, the enumeration was extended to include veterans in all types of residential structures except institutions and transient hotels. Occupancy and vacancy data for publicly financed housing for the Waco locality were obtained from reports of the National Housing Agency as of the end of November.

The number of privately financed dwelling units shown in this report for Waco is an estimate based on the weighted sample results and the 1940 census data plus building permit records. The number of World War II veterans shown in this report is an estimate of the number of veterans in the locality exclusive of those in institutions and hotels. This figure was based on the weighted sample results and on an independent estimate derived from the distribution of veterans by state of preservice residence and the proportion of 1-C Selective Service registrants in the locality. This estimate is only a rough approximation but is the best that can be made from the limited information available.

An examination of the results shows that this survey, like practically all others based upon a field canvass of a cross-section of the population, did not cover a proportionate share of the most mobile parts of the population, e.g., veterans who were traveling about preparatory to taking a job and establishing a residence. In addition, some persons who were actually veterans were not identified as such because of inaccurate or inadequate information furnished by the respondents. The characteristics of such groups may not be the same as those of the enumerated veterans, but in the absence of information concerning these characteristics no adjustment has been made in the results of the survey because of this factor.

The figures presented in this report may differ somewhat from the results which would have been obtained by a complete census because of sampling variability. In general, the allowance to be made for sampling variation depends both on the numerical value of the percentage and the size of the base on which the percentage is determined, a percentage based on a larger number of dwelling units or veterans being less variable than one based on a smaller number. For example, in at least two out of three instances, almost all of the estimated percentages based on total veterans (column 1 of tables 1 through 5) may be expected to be not more than two percentage points larger or smaller than the percentages which would have been obtained if a complete census had been taken. Almost all of the percentages based on married white veterans are subject to an allowance of plus or minus two percentage points while those based on married Negro veterans are subject to an allowance of plus or minus three percentage points. Thus for the 27 percent of the total veterans who would like to buy or build a house it may be expected that the proportion which would have been obtained by a complete census would have been between 25 percent and 29 percent; for the 29 percent of the married Negro veterans who were living doubled up, the proportion would have been between 26 percent and 32 percent.

In addition to sampling variability, the estimates are subject to errors of response. Such errors may be expected to affect the sample estimates to about the same degree as they would affect the results of a complete census.

DEPARTMENT OF COMMERCE
Bureau of the Census

Population: HVet-No. 101

Survey of World War II Veterans and Dwelling Unit Vacancy and Occupancy in Raleigh, N. C.

Approximately one out of two married white World War II veterans and three out of five married Negro veterans in Raleigh were doubling up with relatives or friends or were living in rented rooms, trailers, or tourist cabins according to the results of a sample survey released today by Director J.C. Capt, Bureau of the Census. The survey, made during late December at the request of the National Housing Agency for the Veterans Emergency Housing Program, further showed that one-fifth of the married white veterans and one-seventh of the married Negro veterans owned their homes.

Of the estimated 4,000 World War II veterans living in Raleigh at the time of the survey, 3,300 were white and 700 were Negro. Five-eighths of the white veterans were married and three-eighths were single, widowed, or divorced. Among the Negro veterans, one-half were married.

The survey also inquired into the housing plans of all the veterans for the next 12 months. When asked what they would do if housing would be available during the next year only at present prices and quality, 11 percent of the white veterans said they would be in the housing market--5 percent would buy or build a house and 6 percent would move and rent. Of the Negro veterans, 9 percent would be in the housing market--5 percent would buy or build and 4 percent would move and rent.

An additional 15 percent of the white veterans and 22 percent of the Negro veterans would be drawn into the housing market if they could find houses at the price, size, and quality they desire. Under such conditions, a total of 20 percent of the white veterans and 22 percent of the Negro veterans would buy or build a house within the next 12 months; and 6 percent of the white and 9 percent of the Negro veterans would move and rent.

VETERANS' HOUSING PLANS FOR THE NEXT 12 MONTHS

Among the white veterans who would buy or build if houses are available at the price and quality they desire, the average (median) price they reported they would be able to pay for a house was $6,000 and the average (median) gross monthly payment they would be able to make, including real estate taxes, fire insurance, heat, light, and cooking fuel, was $50. Their average (median) weekly income from all sources was $52. The average size house they desired was six rooms. Negro veterans who would buy or build under these conditions reported an average price of $3,000, an average monthly payment of $25, and an average weekly income of $30. The average size house Negro veterans desired was five rooms.

Among the white veterans who would move and rent other quarters if they could get what they wanted, the average gross monthly rental they reported they would be able to pay was $45, their average weekly income was $44, and the average size unit they desired was four rooms. For Negro veterans who would move and rent, the average monthly rental reported was $20, their average weekly income was $30, and the average size unit they desired was four rooms.

38267

GENERAL CHARACTERISTICS OF VETERANS

One-fifth (21 percent) of the veterans living in Raleigh at the time of the survey were newcomers to the locality since they entered the service. The proportion of in-migrants for married veterans was considerably higher than the proportion for single veterans. (See table 1 on page 5.)

More than five-sixths (85 percent) of the married white veterans and over one-half (55 percent) of the single white veterans were employed. Of the Negro veterans, 87 percent of the married and 63 percent of the single were employed. Veterans in the "other than employed" group included those who did not desire work at the time of the survey as well as those who were seeking employment. Five-eighths of all the veterans who were not working had been discharged since December 31, 1945.

For all veterans, the average (median) weekly income from all sources was $38. (Average income was based on all veterans, including those who reported having no income.) For employed veterans, the average weekly income was $46. For employed white veterans, weekly incomes averaged $55 for married (including wife's income, if any) and $39 for single veterans; for employed Negro veterans, incomes averaged $32 for married and $29 for single veterans.

PRESENT LIVING ARRANGEMENTS OF VETERANS

Hardship among veterans was partly reflected by the extent to which they were doubling up with relatives or friends or were living in rented rooms, trailers, or tourist cabins. One-fourth (24 percent) of the married white veterans and one-fourth (24 percent) of the married Negro veterans were doubling up in ordinary dwelling units, that is, were living in units which contained, in addition to the head of the household, one or more married couples or married women whose husbands were living elsewhere. Thirty-eight percent of the single white veterans as compared with 21 percent of the married white veterans were living in rented rooms, trailers, or tourist cabins. For the Negro veterans, these proportions were 43 percent for the single and 34 percent for the married. (See table 2 on page 5.)

Exclusive of those living in rented rooms, about three percent of the total white veterans and thirty-five percent of the total Negro veterans lived in dwelling units which were in need of major repairs or lacked one or more standard plumbing facilities—running water, private flush toilet, and private bath.

One-fifth (20 percent) of the married white and one-seventh (14 percent) of the married Negro veterans owned their homes. (See table 2 on page 5.) Two-fifths of the white and three-tenths of the Negro owners purchased their homes after they were discharged. Almost one-half (47 percent) of the married white veterans and over one-third (35 percent) of the married Negro veterans were renting dwelling units in their names at the time of the survey and were paying an average (median) gross monthly rent of $47 and $22 respectively. Two-thirds of the white veterans and one-half of the Negro veterans who were renting acquired their units after they were discharged.

HOUSING PLANS OF VETERANS

Nine-tenths (91 percent) of the total veterans plan to remain in the Raleigh locality for the coming year. Five percent of the veterans plan to leave the locality and four percent are undecided in their plans. (See table 3 on page 6.)

If housing is available during the year only at present prices and quality, 5 out of every 100 white veterans plan to buy or build in the locality, 6 plan to move and rent, 78 plan to remain in their present quarters, and the remaining 11 plan to move into rented rooms or double up, leave the area, or are undecided. Out of every 100 Negro veterans, 5 plan to buy or build, 4 plan to move and rent, 82 plan to remain in their present quarters, and the remaining 9 have other plans.

38267

However, if the veterans could find what they want, 20 out of every 100 white veterans would buy or build a house, 6 would move and rent, and only 63 would remain in their present quarters during the coming year. (See table 5 on page 6.) If the Negro veterans could find what they want, 22 out of every 100 would buy or build a house, 9 would move and rent, and 60 would remain in their present quarters.

For the white veterans who would buy or build if they could find what they want, the average (median) price house they said they could afford was $6,000. One-tenth of the veterans could pay less than $4,600 and only one-sixth could pay more than $8,000. Negro veterans desiring to buy or build reported they could afford to pay an average price of $3,000 with one-fifth able to pay less than $2,300 and one-fourth able to pay more than $3,500. Four-fifths of the white veterans preferred five- or six-room houses and four-fifths of the Negro veterans preferred four- or five-room houses. Two-thirds of the white veterans and two-thirds of the Negro veterans who would buy or build a house have taken some action toward buying or building or have saved money specifically for a house.

Practically all of the prospective home owners would purchase through monthly payments. The gross monthly payments they reported they would be able to make, including real estate taxes, fire insurance, heat, light, and cooking fuel, averaged $50 for white veterans and $25 for Negro veterans. One-fifth of the white veterans planning to buy or build reported they could pay less than $36 and one-fifth could pay more than $55. Among the Negro veterans, one-third could pay less than $21 and only one-sixth more than $35.

For the veterans who would move and rent if they could find what they want, the average (median) gross monthly rental they reported they would be able to pay, including payments for heat, light, and cooking fuel, was $45 for white and $20 for Negro veterans. One-sixth of the white veterans who plan to move and rent reported they could pay less than $31 and one-sixth could pay more than $55. Among the Negro veterans, one-tenth could pay less than $13 and one-tenth could pay more than $25. Units in single-family structures were preferred by five-eighths of all the veterans who would like to rent.

AVAILABILITY AND CHARACTERISTICS OF PRESENT HOUSING

In conjunction with the survey of veterans, information on occupancy and vacancy in dwelling units was collected. Tables 6, 7, and 8 on the following pages summarize the availability and characteristics of vacant dwelling units and tenure, rent, facilities, and doubling-up in occupied dwelling units.

The survey showed that 0.5 percent of all the dwelling units in Raleigh, including privately and publicly financed dwelling units, were unoccupied. The gross vacancy rate for privately financed dwelling units alone was the same, 0.5 percent—in white neighborhoods, 0.4 percent, and in Negro neighborhoods, 0.7 percent.

About three-fifths of the private vacancies were habitable; of these, one-fifth lacked installed cooking facilities. Approximately one-third of the habitable vacancies were being offered for rent or sale and the remainder were either already rented or sold or were being held off the rental or sale market for other reasons.

Two-thirds (67 percent) of the habitable vacancies were built before 1930, one-seventh (15 percent) were located in converted structures (structures in which the number of dwelling units has changed since the original construction), five-eighths (62 percent) had been vacant one month or longer, one-seventh (15 percent) lacked one or more standard facilities, and the average size was five rooms.

The survey further showed that 28 percent of the privately financed dwelling units in which white veterans lived contained doubled-up families as compared with 14 percent for all private units occupied by white families. For Negroes the proportions were 31 percent and 14 percent respectively. (See table 7 on page 7.) Practically all of the veteran-occupied units with doubled-up families contained one or more married couples in addition to the head of the household while very few contained only married women in addition to the head.

38267

One-half (49.5 percent) of all the private dwelling units in Raleigh were occupied by their owners and one-half (50.0 percent) were occupied by tenants. The average (median) monthly contract rent was $43 for private units occupied by white tenants and $14 for those occupied by Negro tenants. (See tables 6 and 7 on page 7.) Among the tenant units containing one or more veterans, the average monthly rental was $42 for units occupied by white families and $15 for those occupied by Negroes. These units were rented by the heads of the households and not necessarily by the veterans themselves.

The proportions of owner-occupied and tenant-occupied dwelling units in December 1946 represent a considerable shift from tenant-occupancy to owner-occupancy since April 1940 when a complete enumeration in the Census of Housing showed that 29.3 percent of all the dwelling units in the city were occupied by their owners and 68.8 percent were occupied by tenants. (The 1940 tenure figures do not include the areas annexed to the city since that time.)

TECHNICAL NOTE

The findings presented in this report are based on a sample survey in Raleigh. For dwelling unit occupancy and vacancy characteristics, approximately 6,700 dwelling units were enumerated to represent all sections of the city and all types of residential structures except institutions, publicly financed housing projects, transient hotels, commercial rooming houses, trailers, and tourist cabins. For information on veterans' housing characteristics and intentions, the enumeration was extended to include veterans in all types of residential structures except institutions, transient hotels, and dormitories. Occupancy and vacancy data for publicly financed housing for the Raleigh locality were obtained from reports of the National Housing Agency as of the end of November. The number of privately financed dwelling units shown in this report for the city is an estimate based on the weighted sample results and the 1940 census data plus building permit records.

An examination of the results shows that this survey, like practically all others based upon a field canvass of a cross-section of the population, did not cover a proportionate share of the most mobile parts of the population, e.g. veterans who were traveling about preparatory to taking a job and establishing a residence. In addition, some persons who were actually veterans were not identified as such because of inaccurate or inadequate information furnished by the person reporting for the household. In order to adjust for this under-enumeration, the estimated number of veterans indicated by the results of the survey has been increased on the basis of a factor obtained in nationwide surveys. In the absence of information concerning the characteristics of the omitted groups, however, no adjustment has been made in the characteristics of veterans as shown by the survey. A more detailed statement of variation due to the under-enumeration may be obtained upon request.

The figures presented in this report may differ somewhat from the results which would have been obtained by a complete census because of sampling variability. In general, the allowance to be made for sampling variation depends both on the numerical value of the percentage and the size of the base on which the percentage is determined, a percentage based on a larger number of dwelling units or veterans being less variable than one based on a smaller number. For example, in at least two out of three instances, almost all of the estimated percentages based on total veterans (column 1 of tables 1 through 4) may be expected to be not more than two percentage points larger or smaller than the percentages which would have been obtained if a complete census had been taken. Almost all of the percentages based on married white veterans are subject to an allowance of plus or minus three percentage points while those based on married Negro veterans are subject to an allowance of plus or minus two percentage points. Thus for the 21 percent of the total veterans who would like to buy or build a house it may be expected that the proportion which would have been obtained by a complete census would have been between 19 percent and 23 percent; for the 24 percent of the married white veterans who were living doubled up, the proportion would have been between 21 percent and 27 percent.

In addition to sampling variability, the estimates are subject to errors of response. Such errors may be expected to affect the sample estimates to about the same degree as they would affect the results of a complete census.

[1] The public housing included all the publicly financed dwelling units which serve Raleigh city.

[2] Included as habitable were units in good condition or in need of only minor repairs and those in need of major repairs which were in no worse condition than similar occupied units in the same neighborhood.

[3] Other vacancies included units undergoing extensive repairs, units to be demolished, units in litigation, etc.

[4] Approximately one-fifth of the habitable vacancies lacked installed cooking facilities for the exclusive use of the intended occupants.

[5] Less than 0.05 percent.

DEPARTMENT OF COMMERCE
Bureau of the Census

Population: HVet-No. 102

Survey of World War II Veterans and Dwelling Unit Vacancy and Occupancy in Austin, Tex.

Approximately two out of five married white World War II veterans and one out of two married Negro veterans in Austin were doubling up with relatives or friends or were living in rented rooms, trailers, or tourist cabins according to the results of a sample survey released today by Director J.C.Capt, Bureau of the Census. The survey, made during December at the request of the National Housing Agency for the Veterans Emergency Housing Program, further showed that about two-fifths of the married white veterans and one-seventh of the married Negro veterans owned their homes.

Of the estimated 9,000 World War II veterans living in the city at the time of the survey, 8,300 were white and 700 were Negro. Two-thirds of the white veterans were married and one-third were single, widowed, or divorced. Among the Negro veterans, about three-fifths were married.

The survey also inquired into the housing plans of all the veterans for the next 12 months. When asked what they would do if housing would be available during the next year only at present prices and quality, 16 percent of the white veterans said they would be in the housing market—7 percent would buy or build a house and 9 percent would move and rent. Of the Negro veterans, 13 percent would be in the housing market--7 percent would buy or build and 6 percent would move and rent.

An additional 18 percent of the white veterans and 18 percent of the Negro veterans would be drawn into the housing market if they could find houses at the price, size, and quality they desire. Under such conditions, a total of 27 percent of the white veterans and 24 percent of the Negro veterans would buy or build a house within the next 12 months; and 7 percent of the white and 7 percent of the Negro veterans would move and rent.

VETERANS' HOUSING PLANS FOR THE NEXT 12 MONTHS

Among the white veterans who would buy or build if houses are available at the price and quality they desire, the average (median) price they reported they would be able to pay for a house was $5,000 and the average (median) gross monthly payment they would be able to make, including real estate taxes, fire insurance, heat, light, and cooking fuel, was $45. Their average (median) weekly income from all sources was $52. The average size house they desired was five rooms. Negro veterans who would buy or build under these conditions reported an average price of $3,000, an average monthly payment of $25, and an average weekly income of $29. The average size house Negro veterans desired was five rooms.

Among the white veterans who would move and rent other quarters if they could get what they wanted, the average gross monthly rental they reported they would be able to pay was $40, their average weekly income was $43, and the average size unit they desired was four rooms. For Negro veterans who would move and rent, the average monthly rental reported was $18, their average weekly income was $20, and the average size unit they desired was four rooms.

38266

GENERAL CHARACTERISTICS OF VETERANS

Approximately one-third (32 percent) of the veterans living in Austin at the time of the survey were newcomers to the locality since they entered the service. The proportion of in-migrants for married veterans was considerably higher than the proportion for single veterans. (See table 1 on page 5.)

Four-fifths (81 percent) of the married white veterans and three-fifths (61 percent) of the single white veterans were employed. Of the Negro veterans, 78 percent of the married and 59 percent of the single were employed. Veterans in the "other than employed" group included those who did not desire work at the time of the survey as well as those who were seeking employment. Nearly three-fifths of all the veterans who were not working had been discharged since December 31, 1945.

For all veterans, the average (median) weekly income from all sources was $41. (Average income was based on all veterans, including those who reported having no income.) For employed veterans, the average weekly income was $47. For employed white veterans, weekly incomes averaged $53 for married (including wife's income, if any) and $36 for single veterans; for employed Negro veterans, incomes averaged $32 for married and $28 for single veterans.

PRESENT LIVING ARRANGEMENTS OF VETERANS

Hardship among veterans was partly reflected by the extent to which they were doubling up with relatives or friends or were living in rented rooms, trailers, or tourist cabins. One-sixth (17 percent) of the married white veterans and about the same proportion (15 percent) of the married Negro veterans were doubling up in ordinary dwelling units, that is, were living in units which contained, in addition to the head of the household, one or more married couples or married women whose husbands were living elsewhere. Thirty-eight percent of the single white veterans as compared with 25 percent of the married white veterans were living in rented rooms, trailers, or tourist cabins. For the Negro veterans, these proportions were 43 percent for the single and 34 percent for the married. (See table 2 on page 5.)

Exclusive of those living in rented rooms, about 7 percent of the total white veterans and 35 percent of the total Negro veterans lived in dwelling units which were in need of major repairs or lacked one or more standard plumbing facilities--running water, private flush toilet, and private bath.

About two-fifths (38 percent) of the married white and one-seventh(15 percent) of the married Negro veterans owned their homes. (See table 2 on page 5.) Nearly three-fifths of the white and two-fifths of the Negro owners purchased their homes after they were discharged. One-fourth (24 percent)of the married white veterans and over one-third (35 percent) of the married Negro veterans were renting dwelling units in their names at the time of the survey and were paying an average (median) gross monthly rent of $40 and $22 respectively. Three-fourths of the white veterans and slightly more than one-half of the Negro veterans who were renting acquired their units after they were discharged.

HOUSING PLANS OF VETERANS

Nine-tenths (91 percent) of the total veterans plan to remain in the Austin locality for the coming year. Six percent of the veterans plan to leave the locality and three percent are undecided in their plans. (See table 3 on page 6.)

If housing is available during the year only at present prices and quality, 7 out of every 100 white veterans plan to buy or build in the locality, 9 plan to move and rent, 73 plan to remain in their present quarters, and the remaining 11 plan to move into rented rooms or double up, leave the area, or are undecided. Out of every 100 Negro veterans, 7 plan to buy or build, 6 plan to move and rent, 78 plan to remain in their present quarters, and the remaining 9 have other plans.

However, if the veterans could find what they want, 27 out of every 100 white veterans would buy or build a house, 7 would move and rent, and only 55 would remain in their present quarters during the coming year. (See table 5 on page 6.) If the Negro veterans could find what they want, 24 out of every 100 would buy or build a house, 7 would move and rent, and 60 would remain in their present quarters.

38266

For the white veterans who would buy or build if they could find what they want, the average (median) price house they said they could afford was $5,000. One-eighth of the veterans could pay less than $3,500 and one-eighth could pay more than $8,000. Negro veterans desiring to buy or build reported they could afford to pay an average price of $3,000 with one-fourth able to pay less than $2,100 and one-tenth able to pay more than $4,000. Four-fifths of the white veterans preferred five- or six-room houses and four-fifths of the Negro veterans preferred four- or five-room houses. About three-fourths of the white veterans and slightly more than one-half of the Negro veterans who would buy or build a house have taken some action toward buying or building or have saved money specifically for a house.

Practically all of the prospective home owners would purchase through monthly payments. The gross monthly payments they reported they would be able to make, including real estate taxes, fire insurance, heat, light, and cooking fuel, averaged $45 for white veterans and $25 for Negro veterans. One-fifth of the white veterans planning to buy or build reported they could pay less than $31 and one-fifth could pay more than $55. Among the Negro veterans, one-tenth could pay less than $20 and one-tenth could pay more than $35.

For the veterans who would move and rent if they could find what they want, the average (median) gross monthly rental they reported they would be able to pay, including payments for heat, light, and cooking fuel, was $40 for white and $18 for Negro veterans. One-fifth of the white veterans could pay less than $30 and one-fourth could pay more than $45. Practically all of the Negro veterans planning to rent could pay amounts ranging from $15 through $20. Units in single-family structures were preferred by five-eighths of all the veterans who would like to rent.

AVAILABILITY AND CHARACTERISTICS OF PRESENT HOUSING

In conjunction with the survey of veterans, information on occupancy and vacancy in dwelling units was collected. Tables 6, 7, and 8 on the following pages summarize the availability and characteristics of vacant dwelling units and tenure, rent, facilities, and doubling-up in occupied dwelling units.

The survey showed that 1.5 percent of all the dwelling units in Austin, including privately and publicly financed dwelling units, were unoccupied. The gross vacancy rate for privately financed dwelling units alone was 1.5 percent—in white neighborhoods, 1.6 percent, and in Negro neighborhoods, 0.8 percent. These findings indicate little change in the total number of unoccupied private units since May 1944 when a similar survey of the city showed a gross vacancy rate of 1.3 percent.

According to the recent survey, practically all of the private vacancies were habitable. About one-half of the habitable vacancies were being offered for rent or sale and the remainder were either already rented or sold or were being held off the rental or sale market for other reasons.

One-fourth (25 percent) of the habitable vacancies were built before 1930, one-tenth (9 percent) were located in converted structures (structures in which the number of dwelling units has changed since the original construction), over one-half (53 percent) had been vacant for one month or longer, and the average size was five rooms.

The survey further showed that 19 percent of the privately financed dwelling units in which white veterans lived contained doubled-up families as compared with 10 percent for all private units occupied by white families. For Negroes the proportions were 19 percent and 8 percent respectively. (See table 7 on page 7.) Practically all of the veteran-occupied units with doubled-up families contained one or more married couples in addition to the head of the household while very few contained only married women in addition to the head.

Five-eighths (62.0 percent) of all the private dwelling units in the city were occupied by their owners and almost three-eighths (36.5 percent) were occupied by tenants. The average (median) monthly contract rent was $35 for private units occupied by white tenants and $13 for those occupied by Negro tenants. (See tables 6 and 7 on page 7.) Among the tenant units containing one or more veterans, the average monthly rental was $36 for units occupied by white families and $15 for those occupied by Negroes. These units were rented by the heads of the households and not necessarily by the veterans themselves.

38266

The proportions of owner-occupied and tenant-occupied dwelling units in December 1946 represent a considerable shift from tenant-occupancy to owner-occupancy since April 1940 when a complete enumeration in the Census of Housing showed that 39.2 percent of all the dwelling units in the city were occupied by their owners and 54.8 percent were occupied by tenants.

TECHNICAL NOTE

The findings presented in this report are based on a sample survey in the city of Austin. For dwelling unit occupancy and vacancy characteristics, approximately 6,200 dwelling units were enumerated to represent all sections of the city and all types of residential structures except institutions, publicly financed housing projects, transient hotels, commercial rooming houses, trailers, and tourist cabins. For information on veterans' housing characteristics and intentions, the enumeration was extended to include veterans in all types of residential structures except institutions, transient hotels, and dormitories. Occupancy and vacancy data for publicly financed housing for the Austin locality were obtained from reports of the National Housing Agency as of the end of November. The number of privately financed dwelling units shown in the report for the city is an estimate based on the weighted sample results and the 1940 census data plus building permit records.

An examination of the results shows that this survey, like practically all others based upon a field canvass of a cross-section of the population, did not cover a proportionate share of the most mobile parts of the population, e.g. veterans who were traveling about preparatory to taking a job and establishing a residence. In addition, some persons who were actually veterans were not identified as such because of inaccurate or inadequate information furnished by the person reporting for the household. In order to adjust for this under-enumeration, the estimated number of veterans indicated by the results of the survey has been increased on the basis of a factor obtained in nationwide surveys. In the absence of information concerning the characteristics of the omitted groups, however, no adjustment has been made in the characteristics of veterans as shown by the survey. A more detailed statement of variation due to the under-enumeration may be obtained upon request.

The figures presented in this report may differ somewhat from the results which would have been obtained by a complete census because of sampling variability. In general, the allowance to be made for sampling variation depends both on the numerical value of the percentage and the size of the base on which the percentage is determined, a percentage based on a larger number of dwelling units or veterans being less variable than one based on a smaller number. For example, in at least two out of three instances, almost all of the estimated percentages based on total veterans (column 1 of tables 1 through 4) may be expected to be not more than two percentage points larger or smaller than the percentages which would have been obtained if a complete census had been taken. Almost all of the percentages based on married veterans are subject to an allowance of plus or minus three percentage points while those based on single veterans are subject to an allowance of plus or minus four percentage points. Thus for the 27 percent of the total veterans who would like to buy or build a house it may be expected that the proportion which would have been obtained by a complete census would have been between 25 percent and 29 percent; for the 17 percent of the married white veterans who were living doubled up, the proportion would have been between 14 percent and 20 percent.

In addition to sampling variability, the estimates are subject to errors of response. Such errors may be expected to affect the sample estimates to about the same degree as they would affect the results of a complete census.

Bureau of the Census

Population: HVet-No. 103

SUMMARY REPORT OF VETERANS' HOUSING SURVEYS MADE FROM JULY 1946 THROUGH SEPTEMBER 1946

The results of the Veterans' Housing Surveys made by the Bureau of the Census between July 1946 and September 1946 were summarized today by Director J. C. Capt, Bureau of the Census. The surveys, requested by the National Housing Agency for the Veterans' Emergency Housing Program, were made in 70 selected cities. Individual reports have been issued for each of the surveys and are available on request.

Thirty-two additional Veterans' Housing Surveys are currently being made by the Bureau of the Census and seven are being made by the Bureau of Labor Statistics, Department of Labor. A report summarizing the results of these surveys will be published as soon as individual reports for the additional surveys have been released.

The Veterans' Housing Surveys are sample surveys covering a representative cross section of all veterans in the localities surveyed except those living in institutions and hotels. The information was collected by trained interviewers directly from the veteran or his wife, or in some cases from some other reliable member of his family.

The information presented in this summary consists of several items on the personal characteristics of the veterans and their housing intentions, and the present living arrangements of the married veterans.

DEFINITION OF TERMS

Employed: A veteran is considered employed if he worked for pay or profit or had a job (but was not at work) during the week prior to the enumeration.

In-migrant: An in-migrant veteran is one whose residence, prior to his entering the service, was outside the housing market area for the locality being surveyed.

Weekly income: The veteran's weekly income is his usual weekly income from all sources including overtime pay, commissions, dividends, and pensions. For the wage and salary workers, the income includes the full weekly wages before deductions are made for bonds or taxes. For married veterans, the wife's income is also included.

Doubling up: For purposes of this survey, a veteran is living doubled-up if he lives in a dwelling unit which contains, in addition to the head of the household, either a married couple or a married woman whose husband is living elsewhere.

Housing intentions: The veteran was asked two basic questions in order to measure his housing intentions. The first question was designed to determine what the veteran really wanted to do about his housing, that is, what he would do under conditions he desires. The question asked of the veteran was: "Suppose you could rent, buy, or build a house or apartment of the price, size, and quality you desire--what would you do about your living arrangements in the next 12 months?"

The second question on the veteran's intentions was designed to determine what he would do if other living quarters were available but only at today's prices and quality. It was asked only of those veterans who had already indicated they wanted different quarters under desired conditions. The question was: "You said you would (rent, buy, build) if you could get the kind and price house you desire--what would you do in the next 12 months if houses became available only at present prices and quality?"

38352

Gross monthly rent able to pay: This was the amount of monthly rent, including payments for heat, light and cooking fuel, which the veteran said he could afford to pay. The monthly rent shown is the median reported by those veterans who would rent under desired conditions of price and quality. In responding to this question the veteran was not to report what he thought he would have to pay but what he considered he could reasonably pay, taking into account his income and other expenses.

Price house able to buy: This is the price the veteran reported he was able to pay for a house taking into consideration his income and other resources. The median prices shown in this summary are for those veterans who reported they would buy or build under desired conditions. The corresponding price figures for those veterans who said they would buy or build under present prices and quality are not shown in this summary. They may be obtained by referring to the individual reports.

TECHNICAL NOTE

The number of World War II veterans shown for each area surveyed is an estimate of the number of veterans in the locality exclusive of those in institutions and hotels. These figures are based on the weighted sample results and on independent estimates derived from the distribution of veterans by state of preservice residence and the proportion of 1-C Selective Service registrants in the locality. The estimates are only rough approximations but are the best that can be made from the limited information available.

An examination of the results shows that these surveys, like practically all others based upon a field canvass of a cross-section of the population, did not cover a proportionate share of the most mobile parts of the population, e. g., veterans who were traveling about preparatory to taking a job and establishing a residence. In addition, some persons who were actually veterans were not identified as such because of inaccurate or inadequate information furnished by the respondents. The characteristics of such groups may not be the same as those of the enumerated veterans, but in the absence of information concerning these characteristics no adjustment has been made in the results of the survey because of this factor.

Because the results of the surveys are based on data obtained from a sample of veterans, the figures presented here may differ somewhat from the results which would have been obtained by a complete census. In general, the allowance to be made for the sampling variation depends both on the numerical value of the percentage and the size of the base on which the percentage is determined. A percentage based on a larger number of veterans has less variability due to sampling than one based on a smaller number. Examples of variations which may be expected because of the sample are as follows: In two chances out of three, for the 31% of the veterans in Philadelphia who would buy or build a house under desired conditions, it may be expected that the proportion which would have been obtained by a complete census would have been between 29% and 33%, and for the 43% of the married veterans in Philadelphia who were living doubled up, or in a rented room, the proportion for a complete census would have been between 40% and 46%.

For Atlanta, for the 47% of the married white veterans who are living doubled up or in a rented room, the chances are two out of three that the rate which would have been obtained by a complete census is between 44% and 50%, and for the 48% of the married Negro veterans who are living doubled up, or in a rented room, the chances are two out of three that the rate would have been between 43% and 53%. Because of the many variations possible in the magnitude of the sampling errors, the examples of sampling variations given above should not be applied indiscriminately to all of the figures presented in this report. For more accurate information on the errors due to sampling variation for any particular area, refer to the individual report for that area.

In addition to the difference due to sampling variability, the estimates are subject to errors of response. Such errors may be expected to affect the sample estimate to about the same degree as they would affect the results of a complete census.

DEPARTMENT OF COMMERCE
Bureau of the Census

Not to be released until
March 26, 1947

Population: HVet-No. 107

Survey of World War II Veterans and Dwelling Unit Vacancy and Occupancy in the Baton Rouge area, Louisiana

Approximately one out of four married white World War II veterans and one out of three married Negro veterans in the Baton Rouge area were doubling up with relatives or friends or were living in rented rooms, trailers, or tourist cabins according to the results of a sample survey released today by Director J. C. Capt, Bureau of the Census. The survey, made during late December at the request of the National Housing Agency for the Veterans Emergency Housing Program, further showed that one-tenth of the married white veterans and two-thirds of the married Negro veterans lived in dwelling units which needed major repairs or lacked one or more standard plumbing facilities—running water, private flush toilet, and private bath.

Of the estimated 10,000 World War II veterans living in the area at the time of the survey, 7,500 were white and 2,500 were Negro. Seven-tenths of the white veterans were married and three-tenths were single, widowed, or divorced. Among the Negro veterans, two-thirds were married.

The survey also inquired into the housing plans of all the veterans for the next 12 months. When asked what they would do if housing would be available during the next year only at present prices and quality, 12 percent of the white veterans said they would be in the housing market—7 percent would buy or build a house and 5 percent would move and rent. Of the Negro veterans, 20 percent would be in the housing market—16 percent would buy or build and 4 percent would move and rent.

An additional 25 percent of the white veterans and 27 percent of the Negro veterans would be drawn into the housing market if they could find houses at the price, size, and quality they desire. Under such conditions, a total of 32 percent of the white veterans and 45 percent of the Negro veterans would buy or build a house within the next 12 months; and 5 percent of the white and 2 percent of the Negro veterans would move and rent.

VETERANS' HOUSING PLANS FOR THE NEXT 12 MONTHS

Of those who plan to buy or build in the present market, the white veterans indicated they are able to pay an average (median) price of $6,000 and Negro veterans reported they are able to pay $2,500.

Among the white veterans who would buy or build if houses are available at the price and quality they desire, the average (median) price they reported they would be able to pay for a house was $6,000 and the average (median) gross monthly payment they would be able to make, including real estate taxes, fire insurance, heat, light, and cooking fuel, was $45. Their average (median) weekly income from all sources was $56. The average size house they desired was five rooms. Negro veterans who would buy or build under these conditions reported an average price of $2,200, an average monthly payment of $25, and an average weekly income of $31. The average size house Negro veterans desired was four rooms.

Among the white veterans who would move and rent other quarters if they could get what they wanted, the average gross monthly rental they reported they would be able to pay was $40, their average weekly income was $49, and the average size unit they desired was four rooms. For Negro veterans who would move and rent, the average monthly rental reported was $15, their average weekly income was $28, and the average size unit they desired was three rooms.

38391

GENERAL CHARACTERISTICS OF VETERANS

One-third (33 percent) of the veterans living in the Baton Rouge area at the time of the survey were newcomers to the locality since they entered the service. The proportion of in-migrants for married veterans was higher than the proportion for single veterans. (See table 1 on page 5.)

Seven-eighths (87 percent) of the married white veterans and three-fifths (60 percent) of the single white veterans were employed. Of the Negro veterans, 79 percent of the married and 56 percent of the single were employed. Veterans in the "other than employed" group included those who did not desire work at the time of the survey as well as those who were seeking employment. About one-half of all the veterans who were not working had been discharged since December 31, 1945.

For all veterans, the average (median) weekly income from all sources was $44. (Average income was based on all veterans including those who reported having no income.) For employed veterans, the average weekly income was $50. For employed white veterans, weekly incomes averaged $57 for married (including wife's income, if any) and $46 for single veterans; for employed Negro veterans, incomes averaged $34 for married and $31 for single veterans.

PRESENT LIVING ARRANGEMENTS OF VETERANS

Hardship among veterans was partly reflected by the extent to which they were doubling up with relatives or friends or were living in rented rooms, trailers, or tourist cabins. One-seventh (15 percent) of the married white veterans and one-fifth (21 percent) of the married Negro veterans were doubling up in ordinary dwelling units, that is, were living in units which contained, in addition to the head of the household, one or more married couples or married women whose husbands were living elsewhere. Twenty-six percent of the single white veterans as compared with nine percent of the married white veterans were living in rented rooms, trailers, or tourist cabins. For the Negro veterans, these proportions were 23 percent for the single and 12 percent for the married. (See table 2 on page 5.)

Exclusive of those living in rented rooms, about one-tenth of the total white veterans and five-eighths of the total Negro veterans lived in dwelling units which were in need of major repairs or lacked one or more standard plumbing facilities.

Three-tenths (30 percent) of the married white and one-fourth (26 percent) of the married Negro veterans owned their homes. (See table 2 on page 5.) Three-fifths of the white and slightly more than two-fifths of the Negro owners purchased their homes after they were discharged. One-half (50 percent) of the married white veterans and two-fifths (41 percent) of the married Negro veterans were renting dwelling units in their names at the time of the survey and were paying an average (median) gross monthly rent of $41 and $19 respectively. Five-sixths of the white veterans and two-thirds of the Negro veterans who were renting acquired their units after they were discharged.

HOUSING PLANS OF VETERANS

Nine-tenths (91 percent) of the total veterans plan to remain in the Baton Rouge locality for the coming year. Five percent of the veterans plan to leave the locality and four percent are undecided in their plans. (See table 3 on page 6.)

If housing is available during the year only at present prices and quality, 7 out of every 100 white veterans plan to buy or build in the locality, 5 plan to move and rent, 79 plan to remain in their present quarters, and the remaining 9 plan to move into rented rooms or double up, leave the area, or are undecided. Out of every 100 Negro veterans, 16 plan to buy or build, 4 plan to move and rent, 69 plan to remain in their present quarters, and the remaining 11 have other plans.

However, if the veterans could find what they want, 32 out of every 100 white veterans would buy or build a house, 5 would move and rent, and only 54 would remain in their present quarters during the coming year. (See table 5 on page 6.) If the Negro veterans could find what they want, 45 out of every 100 would buy or build a house, 2 would move and rent, and 42 would remain in their present quarters.

3839/

For the white veterans who would buy or build if they could find what they want, the average (median) price house they said they could afford was $6,000. One-fifth of the veterans could pay less than $4,500 and one-fifth could pay more than $7,500. Negro veterans desiring to buy or build reported they could afford to pay an average price of $2,200 with one-fourth able to pay less than $1,800 and one-sixth able to pay more than $3,500. Four-fifths of the white veterans preferred five- or six-room houses and seven-tenths of the Negro veterans preferred four- or five-room houses. Almost three-fifths of the white veterans and one-half of the Negro veterans who would buy or build a house have taken some action toward buying or building or have saved money specifically for a house.

Practically all of the prospective home owners would purchase through monthly payments. The gross monthly payments they reported they would be able to make, including real estate taxes, fire insurance, heat, light, and cooking fuel, averaged $45 for white veterans and $25 for Negro veterans. One-fourth of the white veterans planning to buy or build reported they could pay less than $36 and one-fifth could pay more than $55. One-sixth of the Negro veterans could pay less than $17 and one-sixth could pay more than $30.

For the veterans who would move and rent if they could find what they want, the average (median) gross monthly rental they reported they would be able to pay, including payments for heat, light, and cooking fuel, was $40 for white and $15 for Negro veterans. One-fifth of the white veterans wanting to rent could pay less than $31 and only one-eighth could pay more than $50. Among the Negro veterans, only one-eighth could pay more than $20. Units in single-family structures were preferred by five-sixths of all the veterans who would like to rent.

AVAILABILITY AND CHARACTERISTICS OF PRESENT HOUSING

In conjunction with the survey of veterans, information on occupancy and vacancy in dwelling units was collected. Tables 6, 7, and 8 on the following pages summarize the availability and characteristics of vacant dwelling units and tenure, rent, facilities, and doubling-up in occupied dwelling units.

The survey showed that 1.7 percent of all the dwelling units in the Baton Rouge area including privately and publicly financed dwelling units, were unoccupied. The gross vacancy rate for privately financed dwelling units alone was the same, 1.7 percent. Almost nine-tenths of the private vacancies were habitable; of these, approximately one-eighth lacked installed cooking facilities. About one-half of the habitable vacancies were being offered for rent or sale and the remainder were either already rented or sold or were being held off the rental or sale market for other reasons.

One-fifth (20 percent) of the habitable vacancies were built before 1930, one-fifth (19 percent) lacked one or more standard plumbing facilities, one-fourth (26 percent) had been vacant for one month or longer, and the average size was five rooms.

One-third of the habitable vacancies were rental units for which the average (median) monthly rental asked was $30 and the average size was three rooms. Three-tenths (30 percent) lacked one or more standard plumbing facilities, more than two-fifths (42 percent) had been built before 1930, three-tenths (29 percent) were units in multi-family structures, and one-tenth (11 percent) were located in converted structures (structures in which the number of dwelling units has changed since the original construction).

Of all the private dwelling units in the Baton Rouge area, more than one-half (53.7 percent) were occupied by their owners and over two-fifths (44.6 percent) were occupied by tenants. The average (median) monthly contract rent was $38 for private units occupied by white tenants and $14 for those occupied by Negro tenants. (See tables 6 and 7 on page 7.) Among the tenant units containing one or more veterans, the average monthly rental was $40 for units occupied by white families and $14 for those occupied by Negroes. These units were rented by the heads of the households and not necessarily by the veterans themselves.

The survey further showed that 16 percent of the privately financed dwelling units in which white veterans lived contained doubled-up families as compared with 9 percent for all private units occupied by white families. For Negroes the proportions were 22 percent and 11 percent respectively. (See table 7 on page 7.) Practically all of the veteran -occupied units with doubled-up families contained one or more married couples in addition to the head of the household, while very few contained only married women in addition to the head.

3839/

TECHNICAL NOTE

The findings presented in this report are based on a sample survey in the Baton Rouge area.[a] For dwelling unit occupancy and vacancy characteristics, approximately 9,500 dwelling units were enumerated to represent all sections of the area and all types of residential structures except institutions, publicly financed housing projects, transient hotels, commercial rooming houses, trailers, and tourist cabins. For information on veterans' housing characteristics and intentions, the enumeration was extended to include veterans in all types of residential structures except institutions, transient hotels, and dormitories. Occupancy and vacancy data for publicly financed housing for the Baton Rouge locality were obtained from reports of the National Housing Agency as of the end of November. The number of privately financed dwelling units shown in this report for the area is an estimate based on the weighted sample results and the 1940 census data plus building permit records.

An examination of the results shows that this survey, like practically all others based upon a field canvass of a cross-section of the population, did not cover a proportionate share of the most mobile parts of the population, e.g. veterans who were traveling about preparatory to taking a job and establishing a residence. In addition, some persons who were actually veterans were not identified as such because of inaccurate or inadequate information furnished by the person reporting for the household. In order to adjust for this underenumeration, the estimated number of veterans indicated by the results of the survey has been increased on the basis of a factor obtained in Nation-wide surveys. In the absence of information concerning the characteristics of the omitted groups, however, no adjustment has been made in the characteristics of veterans as shown by the survey. A more detailed statement of variation due to the underenumeration may be obtained upon request.

The figures presented in this report may differ somewhat from the results which would have been obtained by a complete census because of sampling variability. In general, the allowance to be made for sampling variation depends both on the numerical value of the percentage and the size of the base on which the percentage is determined, a percentage based on a larger number of dwelling units or veterans being less variable than one based on a smaller number. For example, in at least two out of three instances, almost all of the estimated percentages based on total veterans (column 1 of tables 1 through 4) may be expected to be not more than one percentage point larger or smaller than the percentages which would have been obtained if a complete census had been taken. Almost all of the percentages based on married veterans are subject to an allowance of plus or minus two percentage points while those based on single veterans are subject to an allowance of plus or minus three percentage points. Thus for the 35 percent of the total veterans who would like to buy or build a house it may be expected that the proportion which would have been obtained by a complete census would have been between 34 percent and 36 percent; for the 21 percent of the married Negro veterans who were living doubled up, the proportion would have been between 19 percent and 23 percent.

In addition to sampling variability, the estimates are subject to errors of response. Such errors may be expected to affect the sample estimates to about the same degree as they would affect the results of a complete census.

---

[a] The survey covered Baton Rouge city, Port Allen town, and the following enumeration districts (as defined for the 1940 Census) in East Baton Rouge Parish: 17-24; 17-26; 17-27; 17-28; 17-29; 17-37; 17-40; 17-41; 17-42; 17-44; 17-46; and 17-48.

One-fourth of the units rented for less than	$26	$33	(3)	$15	(3)
One-fourth of the units rented for more than	$47	$49	(3)	$25	(3)

[1] For purposes of this survey, a veteran was considered as living doubled-up if he lived in a dwelling unit which contained more than one family, that is, the unit contained, in addition to the head of the household, married couples or married women with husbands absent.

[2] Standard plumbing facilities included running water in the unit, private flush toilet in the structure, and private installed bathtub or shower in the structure.

[3] There were too few single veterans in the sample who rented their dwelling units to quote average monthly rental.

Other[3]	0.2	0.2	0.3	0.2
Not habitable	0.2	0.2	0.1	0.4

[1] The public housing included all the publicly financed dwelling units which serve the area covered in the survey.

[2] Included as habitable were units in good condition or in need of only minor repairs and those in need of major repairs which were in no worse condition than similar occupied units in the same neighborhood.

[3] Other vacancies included units undergoing extensive repairs, units to be demolished, units in litigation, etc.

[4] Approximately one-eighth of the habitable vacancies lacked installed cooking facilities for the exclusive use of the intended occupants.

[5] Less than 0.05 percent.

Table 7.—CHARACTERISTICS OF ALL PRIVATELY FINANCED DWELLING UNITS

Baton Rouge Area, Louisiana

DEPARTMENT OF COMMERCE
Bureau of the Census

Not to be released until
May 10, 1947

Population: HVet-No. 114

SUMMARY REPORT OF VETERANS' HOUSING SURVEYS MADE FROM JULY 1946 THROUGH JANUARY 1947

The results of the Veterans' Housing Surveys made by the Bureau of the Census and the Bureau of Labor Statistics between July 1946 and January 1947 were summarized today by Director J. C. Capt, Bureau of the Census. The surveys, requested by the National Housing Agency for the Veterans' Emergency Housing Program, were made in 109 selected localities. Individual reports have been issued for each of the surveys and are available on request.

In conjunction with the surveys included in the attached summary table, the Bureau of the Census conducted a Nation-wide veterans' survey during the latter part of June 1946. A report on the results of this survey is available at the National Housing Agency in Washington, D. C.[a] The surveys in the Cleveland, Detroit, Indianapolis, Kansas City, Newark (Essex County, N. J.), New York City, Philadelphia, and St. Louis areas are being supplemented by the Bureau of Labor Statistics to provide separate figures for Negro veterans. Reports for these supplements will be available in May. Also, nineteen other Veterans' Housing Surveys, in which a slightly different schedule was used, were conducted during March, April, and May, 1946.[b]

The Veterans' Housing Surveys are sample surveys covering a representative cross section of all veterans in the localities surveyed except those living in institutions, transient hotels, and dormitories. The information was collected by trained interviewers directly from the veteran or his wife, or in some cases from some other reliable member of his family.

The information presented in this summary consists of several items on the personal characteristics of the veterans and their housing intentions, and the present living arrangements of the married veterans.

DEFINITIONS OF TERMS

Employed: A veteran is considered employed if he worked for pay or profit or had a job (but was not at work) during the week prior to the enumeration.

In-migrant: An in-migrant veteran is one whose residence, prior to his entering the service, was outside the housing market area for the locality being surveyed.

Weekly income: The veteran's weekly income is his usual weekly income from all sources including overtime pay, commissions, dividends, and pensions. For the wage and salary workers, the income includes the full weekly wages before deductions are made for bonds or taxes. For married veterans, the wife's income is also included.

Doubling up: For purposes of this survey, a veteran is living doubled up if he lives in a dwelling unit which contains, in addition to the head of the household, either a married couple or a married woman whose husband is living elsewhere.

---

[a] The title of the report is "A National Survey of Veterans' Housing Plans and Present Accommodations as of June 1946."
[b] Surveys were made by the Bureau of the Census in the following places: Macon area, Georgia; Henderson, Kentucky; Benton Harbor - St. Joseph area, Michigan; Bismarck and Mandan, North Dakota; Eugene and Springfield, Oregon; Erie area, Pennsylvania; Johnstown area, Pennsylvania; Orange area, Texas; Greater San Antonio, Texas; Everett area, Washington; and Madison area, Wisconsin. Similar surveys were made by the Bureau of Labor Statistics in the following places: Mobile area, Alabama; Little Rock area, Arkansas; San Francisco area, California; Minneapolis - St. Paul area, Minnesota; Portland area, Oregon; Pittsburgh area, Pennsylvania; Charleston area, South Carolina; and Dallas area, Texas. A report, "Veterans' Housing Plans and Present Accommodations for Selected Areas," summarizing the results of these nineteen surveys is available at the National Housing Agency.

37/25

Housing intentions: The veteran was asked two basic questions in order to measure his housing intentions. The first question was designed to determine what the veteran really wanted to do about his housing, that is, what he would do if he could get the kind of housing he desired. The question asked of the veteran was: "Suppose you could rent, buy, or build a house or apartment of the price, size, and quality you desire--what would you do about your living arrangements in the next 12 months?"

The second question on the veteran's intentions was designed to determine what he would do if other living quarters were available but only at present prices and quality. It was asked only of those veterans who had already indicated they wanted to rent, buy, or build under desired conditions. The question was: "You said you would (rent, buy, build) if you could get the kind and price house you desire--what would you do in the next 12 months if houses became available only at present prices and quality?"

In responding to this second question, some of the veterans who would rent if they could find what they wanted would also rent under today's housing conditions, while others would remain in their present quarters. Similarly, some of the veterans who would buy or build if they could find the kind of housing they desire would buy or build even under present housing conditions, others would move and rent, and still others would remain in their present quarters. Because of the shift in the veteran's intentions under the two conditions, the percent of veterans who would move and rent other quarters under present prices and quality may be higher or lower than the percent of veterans who would move and rent under the housing conditions they desire. For example, in the Wilmington area, Delaware, of the five percent who would rent under present prices and quality, two had already said they would rent under desired conditions and three had said they would buy or build under desired conditions.

Gross monthly rent able to pay: This was the amount of monthly rent, including payments for heat, light, and cooking fuel, which the veteran said he could afford to pay. The monthly rent shown is the median reported by those veterans who would rent under desired conditions of price and quality. In responding to this question the veteran was not to report what he thought he would have to pay but what he considered he could reasonably pay, taking into account his income and expenses.

Price house able to buy: This is the price the veteran reported he was able to pay for a house taking into consideration his income and other resources. The median prices shown in this summary are for those veterans who reported they would buy or build under desired conditions. The corresponding price figures for those veterans who said they would buy or build under present prices and quality are contained in the individual reports for surveys having a sufficient number of sample cases to quote such prices.

TECHNICAL NOTE

The number of World War II veterans shown for each area surveyed is an estimate of the number of veterans in the locality exclusive of those in institutions, transient hotels, and dormitories. An examination of the results shows that these surveys, like practically all others based upon a field canvass of a cross section of the population, did not cover a proportionate share of the most mobile parts of the population, e.g., veterans who were traveling about preparatory to taking a job and establishing a residence. In addition, some persons who were actually veterans were not identified as such because of inaccurate or inadequate information furnished by the person reporting for the household. In the absence of information concerning the characteristics of the omitted groups, however, no adjustment was made in the characteristics of veterans as shown by the survey.

For the earlier surveys, estimates of the number of veterans were based on the weighted sample results and on independent figures derived from the distribution of veterans by state of pre-service residence and the proportion of 1-C Selective Service registrants in the locality. For the later surveys, the estimates of veterans indicated by the results of the survey were increased on the basis of a factor obtained in Nation-wide surveys in order to adjust for underenumeration.

39/25

Because the results of the surveys are based on data obtained from a sample of veterans, the figures presented here may differ somewhat from the results which would have been obtained by a complete census. In general, the allowance to be made for the sampling variation depends both on the numerical value of the percentage and the size of the base on which the percentage is determined. A percentage based on a larger number of veterans has less variability due to sampling than one based on a smaller number. Examples of variations which may be expected because of the sample are as follows: In two chances out of three, for the 31% of the veterans in Philadelphia who would buy or build a house under desired conditions, it may be expected that the proportion which would have been obtained by a complete census would have been between 29% and 33%, and for the 43% of the married veterans in Philadelphia who were living doubled up or in a rented room, the proportion for a complete census would have been between 40% and 46%.

For Atlanta, for the 47% of the married white veterans who were living doubled up or in a rented room, the chances are two out of three that the rate which would have been obtained by a complete census is between 44% and 50%, and for the 48% of the married Negro veterans who were living doubled up or in a rented room, the chances are two out of three that the rate would have been between 43% and 53%. Because of the many variations possible in the magnitude of the sampling errors, the examples of sampling variations given above should not be applied indiscriminately to all of the figures presented in this report. For more accurate information on the errors due to sampling variation for any particular area, refer to the individual report for that area.

In addition to the difference due to sampling variability, the estimates are subject to errors of response. Such errors may be expected to affect the sample estimates to about the same degree as they would affect the results of a complete census.

39/25

SUMMARY OF RESULTS OF WORLD WAR II VETERANS' HOUSING SURVEYS MADE BY THE BUREAU OF THE CENSUS AND THE BUREAU OF LABOR STATISTICS FOR THE NATIONAL HOUSING AGENCY: JULY 1946 THROUGH JANUARY 1947

SURVEY AREA	Month of enumeration	H-Vet series number[1]	Estimated number of World War II veterans	Percent employed	Percent immigrants	Median weekly income of all veterans	Percent married	Percent of married veterans living in rented rooms or doubling up	HOUSING INTENTIONS OF VETERANS: Veterans who would move and rent other quarters: If housing available only at present price and quality: Percent of veterans	Veterans who would move and rent other quarters: If housing available at price and quality veteran desires: Percent of veterans	Veterans who would move and rent other quarters: If housing available at price and quality veteran desires: Median gross monthly rent able to pay	Veterans who would buy or build a house: If housing available only at present price and quality: Percent of veterans	Veterans who would buy or build a house: If housing available at price and quality veteran desires: Percent of veterans	Veterans who would buy or build a house: If housing available at price and quality veteran desires: Median price able to pay

PENNY-A-DAY HOSPITAL

By

Claire and George Sessions Perry

Frankly, this is a success story; one that makes a heartening comment on democracy, in these dark days of race hatred and persecution. It is one of those things, we think, that make you genuinely happy to belong to the human race.

In 1932, a twenty-seven-year-old Negro, named Albert Dent, was offered a job as superintendent of a small Negro hospital in New Orleans. For a while he reserved his decision. Though he had had no medical education, he knew what his hospital's problem would be. It would be poverty; poverty and the fruits thereof: tuberculosis, syphilis, a great need for maternal and infant welfare.

And with what would he be equipped to meet these problems?

A one-hundred-bed, modern hospital, a budget of sixty thousand dollars, and thirty-five licensed Negro doctors, only ten of whom had served an internship. In short, he would have an excellent small hospital without an adequate medical staff.

He accepted the job.

Dr. C. Jeff Miller, at that time president of the American College of Surgeons and professor of gynecology at Tulane University School of Medicine, came forward, bringing with him outstanding faculty members from Tulane and Louisiana State to serve as senior and junior consultants in each department. These consultants, all teachers, and the active staff of thirty-five Negro doctors began an experiment.

At this point many people said the obvious thing: Negro doctors and white doctors will never work together in harmony in the South. That did not matter. The men from the medical schools had said they would serve. And at once Flint-Goodridge Hospital began to fill a double function. It healed the sick, and served as a postgraduate school of medicine for Negro doctors. West of a curved line that begins in Chicago and veers sharply eastward toward the Atlantic coast and returns no farther west than New Orleans, there is no accredited hospital where Negro doctors are given regular staff appointments.

This staff arrangement worked beautifully. As Negro doctors gained the ability to head their departments they were promoted to that position, and given the title of department chief. This title was given--in place of junior consultant--for the practical reason that it pointed up the fact that some Negro doctors could handle top jobs. Otherwise, it was felt, the Negro population of New Orleans would think a Negro doctor was good enough for minor complaints, but that really sick people had best call a white doctor.

The white senior consultants, the de facto heads of each department, were, as a matter of hospital principle, retained permanently and, besides the medical contributions of these men, they also served as a bridge of friendship between the

hospital and the members of the white medical-college faculties.

Now that there was a staff, the hospital was ready to attack--and the connotation of virility and aggressiveness in that verb is not misused--its central problems.

Just here the very practical young superintendent decided upon a tactic, a viewpoint, that was henceforth to make his institution effective out of all proportion to its size. He simply saw a hundred-bed hospital on one side and on the other tens of thousands of Negroes in the community needing care. To serve the Negroes of New Orleans and Southern Louisiana in those beds was impossible. His hospital must therefore reach out someway to them. It must be a focal point of medical knowledge and experience, and those same things must rediate from it to the scattered Negro doctors, and through them to the people.

First there was tuberculosis.

The hospitalization of Negro tuberculosis patients in Louisiana is an enormous problem. For adequate hospitalization there should be at least one sanatorium bed for each annual death from tuberculosis. In 1934 there were 891 Negro deaths from tuberculosis in Louisiana, while there were only 182 beds available. Obviously, there were, during that year, 709 active cases of tuberculosis not isolated, and spreading disease in the community. Therefore, again to serve a double purpose, Dent arranged for a man from one of the white universities to lecture once a week to a tuberculosis section of Negro doctors.

Only one requirement was made of the doctors who wished to attend. They were asked to give a tuberculin test to each of their patients. The hospital would furnish the tuberculin. If the test proved positive, the hospital would X-ray the patient, along with every member of his family, free. The patients were to remain the private patients of the doctors, though the records of these patients must be submitted for discussion at the monthly staff meetings.

If this plan worked, hundreds of persons, who would not otherwise have known they were infected, would know the truth and could act accordingly.

It did succeed, and the class will go on year after year doing its work of education and prevention.

The attack on the syphilis problem was made in precisely the same way: free lectures for the doctors, who would be furnished all tests and medicines necessary. These lectures and their two-way results have been no less successful.

The infant and maternal situation was more spectacularly bad; 89.9 per cent of the deliveries among colored women in rural Louisiana and 21.7 per cent of those in New Orleans were being performed by midwives. To qualify as a midwife in that state, a woman must have performed six deliveries in the presence of a licensed midwife or doctor. That is all. No requirements for sterilization. No knowledge even of sanitation is required. Yet women qualified under this preposterous law were delivering thousands of babies each year.

First Dent engaged a social worker to form mothers' clubs among the women and instruct them in prenatal care and the inadvisability of trafficking with midwives. The results of this campaign were negligible. The reason was pathetically

apparent. The customary fee of a midwife ranges between ten and twenty dollars. Most Negroes simply could afford nothing better.

There was but one thing to do. It was a daring, spectacular thing, but it had to be done. He asked the permission of his governing board and got it. Then he called in his social-service worker.

"Go to your mothers' clubs," he told her, "and tell them that we will take any maternity case that comes to us for a flat rate of ten dollars, to include doctors, medicines, and hospitalization for as long as seven days."

The result, and a situation probably unique in the United States: More white women than Negro women in New Orleans now employ midwives. The number of hospital births at Flint-Goodridge in 1938 had increased 400 per cent over 1932.

Flint-Goodridge Hospital, of Dillard University, came into existence under the name of Phyllis Wheatley Hospital, fifty years ago. It was started by a group of local Negro women and operated in a private residence. Through several changes the hospital struggled heroically until 1930. At this point important new friends offered their services.

First, Edgar Stern, member of an old New Orleans family, came forward to lead a merger of Straight College (Congregational), New Orleans University and Flint-Goodridge Hospital (Methodist) into one improved university and hospital for Negroes. The board was composed of Southern and Northern whites and Negroes, men and women. Local white members, in addition to Edgar Stern, were a prominent lawyer, a banker, a newspaper executive, and the collector of customs.

Where the Money Came From

Furthermore--and this explains the present name of the university--Booker T. Washington had interested Miss Anna T. Jeanes in giving a million dollars for Negro education. When this fund was created James Hardy Dillard, a Virginian, who was the dean of the college at Tulane, was appointed president of the Jeanes Foundation. And since Doctor Dillard had administered this fund so ably, had done so much to further Negro education, it seemed fitting that the newly organized college be Dillard University. Then Dr. C. Jeff Miller agreed to act as chairman of the committee to raise money for the new hospital.

Perhaps the crowning stroke of good fortune was that, purely by accident the late Dr. Charles Mayo happened to be in New Orleans at this time, and made the key speech that put the whole movement in motion under full sail. Persons who had, all along, felt the need for these steps were shocked to discover that the Mayos thought so too.

Under the push of these personalities, the fund secured half a million dollars each from the Rockefellers, the Congregational and the Methodist Episcopal Churches; a quarter million from the Julius Rosenwald Fund; two hundred thousand dollars from the white citizens of New Orleans; and finally, from bed ticking, stocking tops, and baking-powder cans, from somewhere, the Negro citizens of New Orleans raised fifty thousand dollars. Here was one set of high hopes that managed to crash through every obstacle of doubt, of prejudice and inertia.

On February 1, 1932, the shining new hospital building stood in snug

completion. On that day, and on the steps of this new structure dedicated to the service of the Negro race and of humanity, Edgar Stern received the Times-Picayune cup which is given yearly to that New Orleans citizen who has rendered the most significant public service.

By this time, of course, the new twenty-seven-year-old superintendent had taken over. Born in Atlanta, he had been educated in the city schools and Morehouse College. From there he had gone straight to an auditing job for an insurance company. But soon he was needed back at college. For it had been told it would be given a five-hundred-thousand-dollar endowment fund if it could match that amount in contributions from other sources. Here was a life-and-death matter to the school. It had to have a man. It recalled Albert Dent, and he delivered. That was one of the reasons he was called to administer the affairs of the new hospital.

A major problem at Flint-Goodridge has always been the fact that the people for whom it was built cannot afford to use it. To lower its rates, the new superintendent did everything possible in the way of efficient management. Further than that, he managed to have much of the hospital work done without cost. At the top of his medical staff the white university faculty members were, of course, serving without pay. Later he arranged, under National Youth Administration auspices, to obtain a group of young colored people to serve as apprentices, the men learning to be orderlies--all hospitals in New Orleans use Negro orderlies--the women to be nursemaids who would be able to attend convalescents or to perform any sort of domestic service.

And How Those Beds Were Needed!

In this way the young people got valuable vocational instructions. They were paid, while learning, by the Government. And Flint-Goodridge was getting half of its nonprofessional work done free of charge.

As a results of these and other reductions in operating costs, the hospital was allowed to increase its free occupancy to 50 per cent of its total, whereas in the beginning, it had been able to allow only 20 per cent to nonpaying patients.

Even so, an appalling situation remained.

The free beds were always full, but only fifty per cent of the pay beds were in regular use. It was rather like pouring water on the ground before men who were dying of thirst.

Whether there was an immediate need for these beds can be seen from the report of Dr. Morris Fishbein, editor of the Journal of the American Medical Association, who investigated conditions at New Orleans Charity Hospital. This summary appeared in the Item-Tribune of November 7, 1937:

> Doctor Fishbein found twenty-seven Negro patients crowded in ten beds, and men and women suffering from tuberculosis and other contagious diseases placed next to children under seven. He said that the temporary Charity Hospital ward conducted at the Pythian Temple presents a"terrible condition" such as he had seen in "no other American city."
>
> "I was amazed at what I saw," he said. "I realize that the hospital has a problem in housing its patients while waiting for the new building to go up. But that cannot justify this horrible condition. On the top

floor, I saw things that I did not believe possible here or elsewhere."

In the meantime the first experiments in group hospitalization were being tried by Baylor Hospital, in Dallas. Statistics showed that, in a group of one thousand people, the average period of hospitalization per person was one day per year. Many would not go at all. Others would stay ten or twenty days.

Having had some experience in insurance, Dent tried it at Flint-Goodridge in 1932-35, enlisting Negro mail carriers and public-school teachers. He sold this protection to them for six dollars per year. The response was encouraging, but he still was not reaching enough people. The plan then became city-wide, with the white hospitals co-operating. They offered insurance contracts covering hospital needs, with choice of any hospital in the city, to employed groups, for nine dollars a year, per person. That was, if the patient desired a semi-private room. If he would accept ward accomodations, the price was seven-fifty.

But the results at Flint-Goodridge were discouraging.

White people bought the contracts. Negroes did not, because they could not. The price was too high. Somehow it must be drastically reduced. For, if the hospital could sell cheap insurance on a large scale, it would convert many charity patients into paying patients. That, in turn, would leave more beds for those who were unable to pay anything at all.

Dent examined his cost sheets for the previous year. He found that the daily cost per patient had been three dollars and sixty-four cents, with the hospital half full. He thought he could further reduce his patient-per-day cost if the hospital were running full capacity.

Theory and practice had established the average time spent in hospitals where a large group was concerned. It had also been proved that insured persons remained in hospitals no longer than the uninsured, possibly because they were able to go to the hospital as soon as necessary, instead of waiting until too late.

At once the superintendent went before his governing board, explained his findings and asked permission to sell hospitalization insurance to any group of employed Negroes who wanted it at the rate of one penny per day.

The board was interested--and regretful; it could not subject the hospital to the possibility of losses it might incur.

Then would the board agree to the plan if outside interests could be found to underwrite any possible losses?

The board agreed.

A Ten-Cent Medical Center

Dent went straight to the administrators of the Julius Rosenwald Fund. They asked him what he considered the maximum possibility of loss. At the very worst, he could visualize no greater loss than forty-five hundred dollars. He was handed a check for that amount.

At once he offered hospitalization insurance for a penny a day. The sub-

scriber was to receive hospital service whenever recommended by his physician for as many as twenty-one days during a year, as a private patient in a ward bed. Services available without further cost to him included board, nursing care, services of interns, operating rooms, X-ray, routine medicines and laboratory examinations. Now the price had been brought within reach of the people he wanted to serve.

On December 1, 1938, there were3231 persons enrolled. The Rosenwald gift of forty-five hundred dollars had never been touched. In the fund there was a small surplus. And there had been a considerable increase in hospital occupancy. For theoreticians on community health insurance, there is an example that should make their hearts pound.

Finally, in its role as a center of radiation of medical knowledge to Negro people and Negro doctors, the hospital brings top-flight doctors from the two local medical schools and from all over the United States for a two-week summer course for any Negro doctor who cares to attend. His only cost is his personal expense, which Dent helps to keep low by housing him in Dillard University's dormitory.

Since 1936, when these courses were begun, one out of every three Negro doctors in Louisiana has attended, as has one out of every five in the six surrounding states.

Also, from October to May, each year, the men from the medical schools conduct two-hour monthly seminars open to doctors within a radius of one hundred and fifty miles of New Orleans.

In 1932 the hospital opened with seven clinics for outpatients in operation. It now has clinics for syphilis, tuberculosis, pediatrics, medicine, gynecology, obstetrics, urology, ear, nose and throat, eye. dental, "well baby," surgery, and diabetes. Until August, 1936, the clinic fee was twenty-five cents per visit. That twenty-five cents stood between many patients and medical care. Therefore it was reduced to ten cents. However, payment was insisted upon in order to create some feeling of responsibility in the patient. Meanwhile, like F. W. Woolworth, and for exactly the same reason, these clinics began to do a land-office business. Incidentally, the tuberculosis clinic was the first in New Orleans to offer the pneumothorax treatment, which is now standard, and consists of temporarily collapsing one lung so that it may rest and rebuild.

Since the infant mortality rate throughout the state was 54-1/10 per cent higher among Negro babies than white, mothers were encouraged to bring their babies to the "well-baby" clinic each month for inspection and advice. Visits to this clinic have increaded from 1242 in 1932 to 4385 in 1938.

No institution as active as this exists without people either liking or disliking it. Only passive things draw a passive response. Well, there is an organization of 250 Negro women in New Orleans known as The Women's Auxiliary of Flint-Goodridge Hospital. It might better be called a society of friends--and proud ones. Flint-Goodridge is their hospital. They know it was hard to get and that somebody has to keep it going.

They work for it, give money for needed equipment such as incubators for premature babies. They interpret the hospital to the community. Finally, they keep

the lawn. And when you look at that lawn, so almost tenderly kept, if you can be moved, you are.

Flint-Goodridge is now on the Fully Approved List of the American College of Surgeons, the highest scientific rating that can be given an American hospital. It is also on the Approved for Internship list of the American Medical Association.

Making a Little Headway

Yet, as might be guessed, Dent is not satisfied with the job his hospital is doing. At present he has only one man selling his group insurance, but now that it has proved successful he wants to increase his membership to fifteen thousand, which, according to his statistics, is the maximum of subscribers his hospital can accommodate. In the near future he also wants to expand his plan so that, for an additional penny per day, the subscriber may may be able to command the services of any physician he cares to choose.

Moreover, he is eager to reopen his nursing school, which had to be closed in 1934 because there was no money to continue it. Since there is no school for midwifery in the South, he is particularly eager to train registered nurses who can go out into the parishes, where Negro doctors are scarce and the midwife has every thing her own way, to deal scientifically with rural maternity problems.

In the conversation with Albert Dent, after having heard--and, incidentally, quite by accident--these exciting facts and accomplishments, the authors asked him what he believed to be the most important thing he had done at Flint-Goodridge.

As Southerners, the authors had already formed their own opinion. This opinion he voiced.

"We have shown that what, in the South, is so often considered futile can be done: That a biracial group of earnest persons can work together on a community problem without friction. They can even tackle quite difficult ones and"--here he smiled, for despite his modesty, he is only thirty-four and must, in his heart, be enormously happy over what he has done for his people--"and perhaps they can even make a little headway."

U. S. MEDICINE IN TRANSITION

Will the development of voluntary forms of doctor-patient cooperation head off the growing trend toward a compulsory federal insurance law?

THE state of medicine in the U.S. is a social problem because the country's conscience has made it so—just as it has made social problems of food, shelter, jobs. Like the Romans we recognize *panem*—if not *circenses*—as a social responsibility. Suffering due to lack of food—and latterly to lack of proper medical care—can produce community action in a way that other matters cannot: nobody gives a hoot whether or not night clubs or even movies are made cheaply available to all; but people who cannot find or pay for proper medical care are resentful, as are those who see the effects of such deprivations upon neighbors and, in the long run, upon the community. That this is true is demonstrated by a recent survey made by the National Opinion Research Center of the University of Denver: 68 per cent of the representative sampling of Americans who answered questionnaires think it would be "a good idea" for the social-security law to cover payments for doctor and hospital care. Even if costs were to be covered by raising payroll deductions, 58 per cent of the pollees would think it "a good idea." These American consumers are so ready for reform of the structure and economics of medicine that they are willing to effect it by compulsion.

Among the increasing numbers of laymen, influential citizens, and even doctors who have long recognized the medico-social problem and have advocated changes in the structure

THE ANATOMY LESSON

In the picture that made Rembrandt famous (opposite page), he showed Professor Tulp explaining fine points to some Amsterdam practitioners. Today a doctor can best keep up with professional progress by working in a hospital—if he can get into one.

---

and economics of U.S. medicine to solve it, some have leaned toward voluntary reform based on doctor-patient cooperation. Like the advocates of compulsory reform, this group also met the resistance of defenders of the medical status quo, especially the respected and powerful American Medical Association, in which are organized 67 per cent of all U.S. doctors. The A.M.A. tends to deny the gravity and social nature of the issue raised by critics. Thus, broadly, all American opinion on the structure and economics of medicine is divided into three parts: the standpatters, the advocates of compulsory reform via federal legislation, and the advocates of voluntary reform via cooperative groups.

Until recently the advocates of voluntary reform made so little headway that a finish fight between standpatters and compulsory reformers seemed inevitable. In such a fight, the public's "felt need" would eventually produce compulsory measures, even over the protests of a profession widely held in such respect as to amount almost to veneration. Nobody who refuses to recognize a real and grave social danger can long win over somebody who faces the facts.

The war staved off the conflict over medicine. The armed forces absorbed one-third of all the active U.S. doctors. The civilian medical crisis—while it became so serious as to overshadow the peacetime medical problem—also became tolerable because viewed as a war phenomenon. But as VE-day approaches, the whole issue is rising again. Doctors are among those helping to raise it. Those now in the armed forces look forward not to simple reconversion, but to a large extent to medical reform. Recently an A.M.A. committee asked doctors in uniform to indicate whether they would want to enter government service or private group practice after the war. Replies reported by the A.M.A. show that 30 per cent of the older men, who have now had opportunity to compare practice under the traditional structure with group practice for the government, want full-time jobs in government service. Moreover, 53 per cent of doctors of all ages want to go into the group form of private practice. Considering all age groups, 63 per cent indicate a preference for a form of practice other than the traditional form of solo practice on a fee-for-service basis.

And, while still opposed to change, the A.M.A. has lately been weakened in its fight. In 1939 the U.S. Supreme Court recognized that medicine is not only a profession but also a trade. The consumers—real or potential—of its services are all the people of the country. And the court dealt medical standpatters a blow when, in effect, it instructed consumers that they have a right to examine the nonprofessional aspects of medicine just as they may examine other trades. Said the court: "The licensed monopolies which professions enjoy constitute, in themselves, severe restraints upon competition . . . There is sufficient historical evidence of professional inadequacy to justify occasional popular protests. The better educated laity of today questions the adequacy of present-day medicine."

What the educated laity needs to know is what U.S. medicine looks like now and what it would look like if it got a new structure and a new economics as a result of voluntary group action. And what—if, as in Europe, such action should prove to be too little or too late—U.S. medicine would look like after reorganization by federal law.

In the first place, the state of American health is nothing to cheer about. The people of the U.S. lose about 1,500,000 man-years of work annually through sickness. From 30 to 50 per cent more mothers (and about 50 per cent more infants in the first month) die than would die if all got good medical care. With more surgery and radiation, 30,000 cancer victims a year could be saved. Of 13 million men examined for the draft, 29 per cent were rejected for medical reasons; this figure takes no account of rejections by reason of such special causes as mental deficiency, mental diseases, or dental troubles. In short, too few Americans are getting the medical care that they need and that the community needs for them.

More people will disagree as to the causes of these shocking facts than will attempt to deny them. But two factors are now widely recognized.

1) Doctors and hospitals are not always available. In 1940 there were about 170,000 licensed physicians in the U.S. (including those out of practice because of old age or administrative duties) or less than one to every 748 persons. Cities and better-off rural areas had a disproportionate share: there was one doctor to every 487 New Yorkers, one to every 1,501 Mississippians. The $6 billion of hospital capital investment is also badly distributed. There is one general-hospital bed to every 263 in the U.S. population—but in New York the ratio is one to 196, in Mississippi one to 667. In 1,300 counties with 17 million population there is no general hospital.

2) Even where doctors and hospitals are available, not all who would like to use them can do so. It is now a dozen years since this fact was established by the Committee on the Costs of Medical Care headed by a past President of the A.M.A., Herbert Hoover's ex-Secretary of the Interior, Dr. Ray Lyman Wilbur (then President of Stanford University). According to a report sponsored by the committee, the annual per capita cost of providing adequate medical care to the U.S. population would, with the utmost economy of organization, be about $25.30. As the complexity and value of diagnostic procedures increase, so does the expense of good medical care. And bills also mount as the population ages and the effects of unscientific nutrition accumulate. In 1937 Dr. Samuel Bradbury, calculating on the basis of the usual fee-for-service methods of payment at somewhat better than average rates, reached the average figure of $66.97 per capita. The problem of meeting a cost lying somewhere between $25.30 and $66.97 is complicated by the catastrophic nature of some diseases: care of ulcers costs, on an average, $77; puerperal complications of miscarriages almost as much as a baby ($95 as against $99); and cancer, $342. Even assuming that these costs average as much as 50 per cent lower in rural districts, the figures are staggering in the light, for example, of the fact that the annual cash income of about two-thirds of U.S. farmers in 1939 (three million families) was about $415. According to the National Health Survey of 1935-36, 90 per cent of the population of this country cannot pay for medical and hospital care adequate to its needs by the usual fee-for-service methods.

And, in fact, Americans do not spend for medical care what they need to spend. In 1930 their outlay ranged from $7.90 for families with under $1,200 income to $82.09 for families

with incomes of $10,000 and over.* Of course, especially in the cities, some of this 90 per cent gets public aid. The best medical care is bought by the rich and—in some large cities—obtained free by the very poor. Some doctors soak the sick rich to balance the fact that they take some private patients at low rates or some free patients in clinics. The healthy rich get away scot-free—so long as they stay healthy. To get first-rate care the middle-income group must mortgage itself. Nor can even the most incorrigible optimist find basis for hope that all will be cleared up by a prosperous postwar economy. In 1939, when the gross national product was $108 billion (1943 prices), the American people took out of their private pockets $2.8 billion for medical services. FORTUNE (January) suggested for the first postwar, postreconversion year a gross national product of $165 billion (1943 prices), with $4 billion earmarked for medical care. For this to suffice to meet the country's medical needs one would have to assume nonexistent factors: maximum efficiency, uniform distribution, spread of catastrophic risks over large groups. The outlook for the extension of medical care, a definitely social need, is very bad if the structure and economics of medicine remain what they have been. There are, however, objective forces making for change, and one arises within medicine itself.

Medicine's geological layers

The history of the word "hospital" shows that once every such institution was primarily for the indigent. Two or three generations ago hospitals were still the dreary resorts of those who couldn't afford to be born and to die at home. At that time, people—if they did not die almost as soon as they were born—could expect fewer years of life than is now considered reasonable. Many sicknesses and deaths that are today considered the avoidable consequences of error or neglect were then considered inscrutable instances of divine wisdom. In those days anybody could hope to master in a few years of training just about all there was of diagnostic and therapeutic technique. Thereupon he would assemble his primitive equipment and examine and treat patients on the basis of fee-for-service. If in a particular case that seemed to call for expensive therapy the traffic would not bear a high enough fee, the tactful practitioner could scale his therapy down—unless the unhappy patient was lucky enough to be so poor that he could get the indicated treatment free. That—plus a glorious tradition of professional dedication—was medicine in the heyday of the solo doctor known as the general practitioner.

Today years of training are required for the mastery of any of medicine's major branches (obstetrics, internal medicine, dermatology, ophthalmology, surgery of various types, neurology, geriatrics—the care of the old—etc.). No doctor masters all branches, and no general practitioner can long proceed safely without consulting specialists. Moreover, today every doctor needs to use, at least occasionally, much complicated machinery. If he could afford to buy an X-ray machine, an electrocardiograph, and basal-metabolism devices (costing about $10,000 at 1940 prices) he would use them only part of the time, and then be unable to get maximum results without the aid of specialized technical help such as is available in a hospital. In addition to being the doctor's best workshop, the hospital is also the place to which his patients expect to go whenever necessary for diagnosis as well as for treatment provided they can afford it—or, again, are so poor as to be eligible for public assistance.

While medicine has obviously advanced, many medical authorities agree that its present structure embodies serious faults. There is insufficient supervision of practice such as is provided by chiefs of service in clinics. There is insufficient use of auxiliary personnel. There is insufficient consultation between general practitioners and specialists, partly because of expense, partly because many doctors, especially in rural areas, are isolated from hospitals, from colleagues, or from

**Exclusive of dentistry, drugs, and medicine. Comparisons in this field are imperfect because of statistical peculiarities, but the broad lines are sufficiently clear.*

REFORMING GOD'S MANSION

This typical Renaissance ward was probably in the famous Hôtel Dieu in Paris. In the mid-eighteenth century Claude Humbert Piarron de Chamousset, a layman, published a scheme for reform of the Hôtel Dieu that projected voluntary prepayment for hospitalization, plus an elementary form of group practice. Organized medicine long remained hostile to such schemes. The passage of two centuries has not entirely changed its attitude, at least in the U.S. Today the American Medical Association accepts the idea of prepayment as a form of insurance, but prefers to see doctors get fees-for-service, that is, a specific sum for each home or office consultation and each special service performed, e.g., X-ray. The A.M.A. accepts the idea of group practice in free clinics or such establishments as the Mayo brothers have developed at Rochester, Minnesota. But it still resists widespread reorganization of medical structure and economics on the basis of prepayment for over-all care by grouped practitioners. British medical men, who once vigorously fought such changes, are now largely reconciled to the gradual obsolescence of most fee-for-service solo practice. Some enthusiastically push for the new methods.

both. Even in cities many physicians cannot get a hospital connection. To be isolated from hospitals, incidentally, is to be seriously disadvantaged from the viewpoint of continued education, which every practitioner needs as new techniques develop. Too many doctors, although they make their rounds by motorcar instead of horse and buggy, function medically as did their grandfathers.

Not that we know no better. As a matter of fact there is one device—group practice—that embodies remedies for almost all the deficiencies noted above. For years wide public recognition has been accorded such institutions as the Mayo Clinic where, under a single roof, a large number of carefully supervised doctors aided by highly trained auxiliaries put at the patient's disposal a mastery of all medical techniques, based on the use of complex, varied, and costly equipment. Patients pay no fee to doctors engaged in such group practice. They pay fixed charges to the clinic, which pays each doctor a salary. The same system prevails in the clinics of many good hospitals, except that service is free or cheap and the doctors may be unpaid. For years interns have been trained to their profession under such a system. Many doctors, on going from the group practice of their internship to a largely solo method of practice, have felt that they have dropped back to a geologically older level of medicine on which they cannot hope to realize their maximum potential of service. Widespread adoption of group practice, it has been estimated by its medical advocates, would result in a 30 per cent reduction in the cost of producing medical services, aside from possibilities of improved medicine.

A major obstacle has been organized U.S. medicine, as represented by the century-old American Medical Association, with its 125,000 members. For many years before the war the A.M.A. was pretty well satisfied with itself.* It had, after decades of struggle, magnificently raised the level of U.S. medical education and the ethical standards of its members. It had done much to protect the public against the recurrent menaces of nostrums and quacks. It had helped to develop and make effective public departments of health.

In later years the A.M.A. grew to believe that all was for the best in the best of possible medical structures. It was dedicated to the notion that there was in the U.S. plenty of medical care for sale or for free, and that the only reason some people were not getting it was that they did not know enough to ask for it. At most, the A.M.A. would concede that there were occasional "local inadequacies," which time would cure. The A.M.A. has tolerated new structural forms and new economic procedures only when they have already become firmly established against its opposition. Whenever it has initiated change, it has seemed to do so only in the hope of heading off still greater changes. For it, the traditional has become the ideal—that is, an individual patient consulting a solo practitioner (who may then consult a specialist) and paying him on the ordinary fee-for-service basis. A.M.A. representatives opposed the reform recommendations of Dr. Wilbur's committee. The editor of its *Journal*, Dr. Morris Fishbein, equated them with "socialism and communism inciting to revolution." Where doctors cooperated with consumers in reform experiments the A.M.A. bitterly opposed them. Those who persisted risked expulsion from medical societies and from the hospitals in which

**A full-length portrait of the A.M.A. appeared in* FORTUNE, *November, 1938.*

SIXTEENTH CENTURY TECHNIQUES: The 1519 woodcut above illustrates bloodletting. The woodcut below (half a century younger) shows a surgeon operating on the battlefield without anesthetic. Surgery, often revolutionized by war, has made great progress in World War II, which also seems to be speeding changes in medical structure and economics.

AN EIGHTEENTH CENTURY HOSPITAL: BEDLAM

they were accustomed to treat their patients. A doctors' boycott of Borden's milk compelled the Milbank Foundation (whose President was also Chairman of the Board of Borden's) to abandon its advocacy of medical reform. Efforts to include medical provisions in the Social Security Act were defeated, partly due to A.M.A. opposition.

Organized medicine has fought every manifestation of group practice, when combined with prepayment. The combination, it has argued, can lead to unethical solicitation and unprofessional competition between groups, as when a bank in Dallas asked for competing bids from two clinics for care of its employees. The A.M.A. warns that a group of doctors could put patients on a conveyer belt and give nothing but a cold mechanical processing; why they would, the A.M.A. has never satisfactorily explained. Although nothing threatens to prevent a patient from choosing between groups or, once in a group, from choosing among its general practitioners his responsible physician (family doctor, medical adviser), the A.M.A. argues that group practice "destroys free choice of doctor by patient" and "the sacred relationship of doctor and patient." In fact, however, the medical relationship can be easier and better without direct financial dealings between doctor and patient.

THE SOLO PRACTITIONER DOES HIS UTMOST

© CAMPBELL PRINTS

But how can doctors who want to serve the mass of the population located between the poles of wealth and indigence count on enough paying patients to make group practice possible? In recent years there has developed an answer to this question: prepayment for medical care, a sort of insurance whose principle is essential to any important change in medical economics and structure, short of state medicine. There are today some 210 voluntary prepayment plans in the U.S. with a total coverage of about 20 million people, 3,600,000 of whom get other than hospital service. Few such plans are connected with group practice now but it is largely because of their spread and the implied potential encouragement of group practice that the medical structure as well as medical economics may be said to be in transition. The rapidity of evolution depends on a variety of factors that become plain on examination of some prepayment and group-practice schemes.

Experiments in reform

The A.M.A. has long been friendly to one form of medical prepayment: cash indemnity insurance against the effects of both accident and illness. Such insurance is written by many commercial companies, which sell it directly or indirectly through employers of labor. In 1941 about 3,500,000 wage earners were thus covered against hospitalization and two million against surgical expenses. For example, the Hazel-Atlas Glass Co. offers for $2.40 a month ($2.01 to women) a policy written by Travelers Insurance. It gives $1,000 worth of life insurance, something to cover time lost in accidents or sickness, $4 a day against hospital confinement, $20 against certain hospital fees, and up to $150 for surgical fees. The medical aspect is known as "cash indemnity for catastrophic sickness." The policyholder patient gets from the insurance company, for example, $150 for removal of kidney, thyroid, or prostate gland, $100 for removal of a malignant tumor, $25 for a tonsillectomy, $10 for amputation of a finger. Patient and doctor settle the total fee between them as in standard fee-for-service practice, and it may, of course, exceed the benefit. Cash indemnity insurance is a convenience but this shortest of possible steps in medical reform can solve no basic problems: it covers no general medical expenses, let alone preventive or family care, and it is no great bargain (1941 subscribers got back about half as much in benefits as they paid in).

Medical innovators have brought forth a multitude of other plans, some thumpingly successful, some quick and ignominious failures. These plans are classifiable in at least ten important ways; their multifarious details easily confuse the uninitiated. They may sell the services of solo doctors—or of a team. They may provide cash with which the patient buys medical service—or the services themselves. They may provide complete preventive, diagnostic, and therapeutic medical and surgical care in home, office, and hospital and even some dental care—or only hospital expenses. They may take care of employees of a single corporation—or of everybody in an area. They may cover individuals—or include dependents. Doctors may get fee-for-service, per capita pay, or salaries. Employees may pay the whole bill, the employer may pay it all, or they may split expenses. Here are a few sample plans.

One of the simplest, known generally as the "Blue Cross," began in 1929 in Dallas. Covering by prepayment hospitalization only (a minor part of the cost of medical care), this

"SOCIALIZED" RAT HUNT: The U.S. conscience and common sense long ago decided that only nationwide social action could succeed in fighting some medical battles, such as that against bubonic plague, which is spread by rats. Hence the preventive and other programs of city and state health departments and of the U.S. Public Health Service, which functions largely in a decentralized way, working through state agencies. Above, left, is a rat-receiving station of the Philadelphia Bureau of Health in 1914. At right is Assistant Surgeon Charles V. Akin of the U.S. Public Health Service supervising a ratproofing job in New Orleans in the same year. Today the U.S. is safe from bubonic plague. Even standpat doctors' organizations approve public-health work of this kind and cooperate with it effectively. Other major public-health concerns: diphtheria, typhus, typhoid, syphilis.

nonprofit plan has become very popular in many U.S. cities and now embraces about 14 million persons who pay in about $150 million annually in dues and premiums. The details vary from city to city. Typical Blue Cross plans provide both individuals and families with coverage against hospitalization (in semiprivate rooms), usually also use of operating rooms, X-rays, laboratory services, and sometimes other extras. Most plans give maternity benefits if husband and wife have been members of a group of subscribers for a minimum period. New York's Blue Cross (Associated Hospitals) is the largest; it has paid out $40 million to hospitals for services to members.

The Blue Cross spreads its risk by requiring each subscriber to come in as a member of a large (and hence medically heterogeneous) group, such as employees of one plant. An increasing number of plans require that 75 per cent of any group enroll. Consequently, they can give a better bargain than commercial policies sold to individuals who apply because they have reason to fear sickness. Plans that (after preliminary medical examination) take individuals and single families who are not part of a group charge a higher price to guard against too big a proportion of bad medical risks. Plans with individual enrollment have had unhappy experiences with maternity benefits since the individual subscribers tend to conceive membership and child at about the same time. As far as it goes, the Blue Cross is admirable—but its benefits are very limited and its rate of growth seems to slow up markedly before it picks up even half the population of any city.

Local medical organizations in at least eighteen states actively sponsor medical prepayment plans of a type latterly tolerated by the A.M.A. The biggest was started in 1940 by the Michigan Medical Society. With the support of the C.I.O.'s United Automobile Workers it has acquired 600,000 subscribers. For two years at the beginning, M.M.S. offered a comprehensive plan. For $24 a year ($54 for a family) it gave complete home, office, and hospital service of general practitioners and specialists. It included all surgery, laboratory and X-ray tests, examinations for eyeglasses, and (after twelve months' membership) obstetrical service. Preexisting conditions, excepting hernia and appendicitis, were cared for. M.M.S. was willing to take in as few as 50 per cent of any given group. It found, however, that some patients and doctors abuse the privileges. Consequently, after getting less than 10,000 members, it withdrew the comprehensive plan. M.M.S. now offers only a surgical plan with limited benefits at lower prices, e.g., $27 for husband, wife, and all children under nineteen. This plan was not self-supporting until fees had been hiked three times, enrollment regulation had been tightened to require entrance of 75 per cent of all eligibles in any group, and early groups had been seasoned by working off ailments they had before joining. Any licensed doctor may join the panel of M.M.S. physicians (open panel) and is then paid on a fee-for-service basis by the plan for all services given to members who come to him. Thus individual bargaining between doctor and patient is eliminated.

Groups at work

The Blue Cross and Michigan plans are based on prepayment. Some other plans add the feature of group practice. An outstanding example is the Ross-Loos Medical Group of Los Angeles, owned and controlled by independent physicians operating as a partnership. It has survived early losses due to inadequate charges to subscribers and an initial blunder of including dependents at a low premium rate. For $30 a year ($36 if subscribers don't come in with a group) it gives 27,000 persons complete general care and all specialist services in office, home, and hospital; up to ninety days' ward hospitalization; X-ray, laboratory tests, physiotherapy, drugs, dressings, ambulance service, and refractions. It gives no hospitalization for maternity cases, dental care, appliances, special nursing, or treatment for venereal diseases. Dependents, generally poorer medical risks, were put out of the plan, but some 75,000 are

now ordinary fee-for-service patients of the clinic; fees range from 50 cents for an office call to $25 for a major operation. Ross-Loos has been asked to take over all medical care in crowded war-production areas but has not done so because of the doctor shortage. Ross-Loos seems to be one of the best examples of what can be done by prepaid grouped doctors to extend medical care.

Industry, for reasons of humanity, efficiency, or both, has made important contributions to the theory and practice of medical reform. For example, there are in the U.S. a variety of employer-sponsored plans for providing medical care to employees through prepaid group practice. A few employers, like Endicott-Johnson, foot the entire bill; i.e., in effect pay an annual bonus amounting to the cost of medical care. Some, like Consolidated Edison of New York, split the cost with the employees. Most sponsor a plan whose costs are borne by the employees. Some, like Standard Oil of Louisiana, include dependents in the plan. Others, like Henry Kaiser's Permanente Foundation (Oakland, California) and Northern Permanente (Vancouver, Washington), have excluded them, sometimes only because of wartime lack of facilities.

The Kaiser scheme is one of the most interesting. It provides employees with superlative medical care in their own hospitals at a low cost (50 cents weekly in Oakland, 60 cents in Vancouver) paid voluntarily and entirely by the employees. The plan, directed by Dr. Sidney R. Garfield, has been publicized by Paul de Kruif's ecstatic book, *Kaiser Wakes the Doctors*, and by Henry J. Kaiser's looming personality. At Oakland, 62,000, or 90 per cent, of Kaiser's shipyard workers have joined the plan. Sixty-six full-time, ten part-time doctors, and 240 graduate nurses serve them with just about everything except maternity and dental care.

The plan does not provide preventive care in the form of routine diagnostic checkups. Dr. Garfield thinks good diagnostic examinations would save money in the long run, but the local union opposed physicals, which always look like a possible basis for laying a man off. A new hospital in Oakland will enable Dr. Garfield to take families at a charge of $7.50 a month for three or more. The Permanente ventures not only pay current expenses and salaries that most doctors regard as enviable (from $5,400 to $12,000 annually) but have yielded a surplus large enough to amortize their capital investment in hospital plant at the rate of about $25,000 a month. The surplus will eventually be used for research and education.

Group Health Association, Inc., is a Washington, D. C., cooperative health plan for government employees, which started

THE MEDICAL FRONTIER: In California Henry J. Kaiser, his employees, and Dr. Sidney Garfield have pioneered in medical reform. Despite the opposition of standpat medical mandarins, they have set up a highly successful prepaid group-practice venture. Employees—shown below (left) in the outpatient waiting room of Permanente Hospital at Oakland—pay 7 cents a day for complete medical and hospital care. The hospital encourages visits at the first sign of trouble: medical care is thus consumed more eagerly than is usual among those who pay fee-for-service and is, in the end, less complicated and less costly. The patients get first-class care from first-class doctors working in systematic association and using complex, costly equipment (center) and able technical helpers. The doctors include general practitioners who consult with staff specialists. At the right a doctor in the Gundersen Clinic at La Crosse, Wisconsin, another group-practice institution, discusses one of his cases with the chief radiologist.

VOLUNTARY COOPERATORS

SPECIALIZED MACHINERY

in 1937 with a grant of $40,000 from the federal Home Owners Loan Corporation. Thirty-five hundred members and 5,600 dependents have joined. Adult members pay $10 to join and $24 a year; the first three children of a family pay $12 a year each, additional children pay nothing. Group Health has doctors' offices, equipment, a drug dispensary, and facilities for minor operations, but its patients must be sent to outside hospitals. Eight full-time and three part-time doctors, nine graduate nurses, and outside hospitals give a fairly complete set of benefits. Maternity care costs $50 extra, and the first house call in any illness, $1. Excluded are dental care, drugs (which are sold at a small profit in the dispensary), and the use of various appliances.

Without these safeguards it would have succumbed early to its congenital weakness, namely that its members come in as individuals and single families rather than in groups. Since there are at least 250,000 government employees eligible to join as individuals, it would be a wonder if Group Health were not to pick up members sure to overutilize its services. As a result it treats no chronic sickness developed within the first three years of membership, and in the first ten months gives no elective surgery, maternity care, or care for preexisting conditions. Moreover, by means of its extra charges it makes up what it loses on prepaid services. Even so, its managers believe that it could achieve a considerably larger membership if the needed doctors were available.

These examples illustrate the major features of most voluntary plans. A few tentative conclusions about their value seem possible. Blue Cross is popular and solid but its scope of benefits is so limited that it can contribute little to the extension of medical care required by the country. The Michigan plan seems definitely to be a delicate plant; the U.A.W. workers are dissatisfied with the narrowness of its scope and will probably organize a broader plan of their own, somewhat along the lines of Kaiser's. The achievements of the Ross-Loos, Permanente, and Washington Group Health plans seem to demonstrate that if a voluntary prepayment plan is to be broad enough in its benefits to affect materially the consumption of medical care, it must be based on group practice.

Government and medicine

At the furthest remove from the beliefs of organized doctors is a miscellaneous body of practices known as socialized medicine—a polar term giving off so much heat that it had better not be used in sober discourse. If to socialize means to adapt to social uses, then most reforms and many present practices are socialized medicine and the expression is too vague to be useful. If socialized medicine is a nationalized free service, paid for by the state with doctors on salaries, it exists only in the Soviet Union. But there are fragments of state or public medicine nearer home. In some parts of rural Canada doctors are paid out of local taxes to provide medical care to all who want it. Many "socialized" aspects of U.S. medical activity are taken for granted by all. States license physicians and to some degree regulate practice. The federal government and some states have indirectly helped to pay medical bills by making some medical expenses tax-deductible. The Farm Security

SPECIALIZED DOCTORS

Administration has lent money so that 420,000 poor people on farms could get prepaid medical care from local doctors organized through their county medical societies.

Tax-supported public-health work (which private doctors approve and assist) is even more important. Urban communities now universally accept public-health officers as policemen and sometimes as welfare agents. They have enormously contributed to the scotching of diphtheria, typhoid, paratyphoid, and typhus, and the lowering of the death rate by 40 per cent since the turn of the century—one of the most significant events in human history. All told, the bill for this work is $130 million, or a dollar a year apiece to every U.S. citizen. Medical aspects of public welfare are an even more costly public function. Half of the $3.2 billion invested in hospitals in 1935 came from government. Just before the war about $750 million a year was spent for medical care out of taxes, or about one-sixth the total U.S. expenditure in the field. The current tendency is to make new categories of people eligible for medical care at public expense. All crippled children and the blind can get free medical care with federal aid. New York has declared eligible anybody who cannot obtain medical care otherwise. The state of Washington offers to all "senior citizens" (over sixty-five) complete free medical care.

Without public funds there would be gross neglect of such enormous jobs as caring for the mentally sick and for those incapable of self-support because of tuberculosis, hookworm, and trachoma. Epidemics of acute communicable diseases (such as smallpox, rabies, typhoid) could not be effectively checked; infantile paralysis and some orthopedic conditions would make permanent public charges of many who can be saved; children's eye, ear, throat, and dental defects would impair their education and future civic usefulness; the costly diagnosis of syphilis and cancer would be avoided by many.

U.S. public health is more fully developed than in most of Europe but here central bodies—the U.S. Public Health Service and the Children's Bureau of the Department of Labor—give grants-in-aid to state and local agencies and expert guidance rather than centralized control. Some feel that this is an American pattern (e.g., federal land grants to independent colleges) to be followed in the general extension of medical care. But with public health and welfare fronts joining and expanding, the question of where to place the line dividing public medicine from private medicine is becoming acute and the question of nationwide compulsory insurance is being increasingly discussed.

Compulsory insurance

The principle involved is not entirely foreign to the U.S.* Today the states disburse under workmen's compensation laws from two to three times the amount spent by all private charities, an estimated $100 million a year for medical benefits alone. The issue of change in medical structure and economics is now posed in its sharpest form in the U.S. in the medical clauses of a bill worked out by the Social Security Board and sponsored last year by Senators Wagner and Murray and Representative Dingell. This, the most far-reaching piece of social-security legislation ever proposed here, provides for a universal payroll deduction of 6 per cent on amounts up to $3,000, plus an equal contribution from all employers, or a charge against self-employed persons of 7 per cent of the market value of their services. Out of this fund would come benefits not only against old age and unemployment, but also against time lost in sickness and disability, maternity, and medical care—womb-to-tomb security for 100 to 110 million Americans, instead of the 60 million now covered.

One-quarter of the total take would go into a "Medical Care and Hospitalization Account." According to the Social Security Board this fraction would run from $1.8 to $2.7 billion a year, depending on the state of prosperity. The Surgeon General would be the responsible administrator, subject to Social Security Board approval, of a sum comparable to what is now spent for all medical and hospital services by the entire population. He would contract for, buy, and deliver without further charges to 100 million persons, or as many of them as want it, just about everything in the way of medical care with the exception of dentistry, home nursing, and medicines outside hospitals. Doctors would be paid by the government either according to a fee schedule detailing all possible services (fee-for-service), or on a per-patient-per-year basis (capitation), or by salary. The method would be "in each area as the majority of the general medical practitioners to be paid for such services shall elect, subject to such necessary rules and regulations as may be prescribed."

Organized labor and the National Farmers Union are for the Wagner bill and its medical provisions. So are a few Congressmen, the Social Security people in Washington who helped to write it, a small minority of doctors, and some (but not all) lay medical progressives. The American Public Health Association, a body as authoritative in its field as the A.M.A. is in the general field, recently incorporated most of the principles in their official program. Opposed to the bill as a whole or to one or more of its provisions—and not always to the same ones—are some lay progressives, the Children's Bureau, the bill's projected administrators in the U.S. Public Health Service, probably a majority of doctors, and most business organizations.

Most vociferously against it is Dr. Fishbein, the top secretariat of the A.M.A., and the National Physicians' Committee for the Extension of Medical Service.* Unfortunately, propaganda of organized medicine is often obviously mendacious. A pamphlet, *$3,048,000,000 of Political Medicine Yearly in the United States*, of which the committee has distributed over 15 million copies, charges that the Wagner bill would create "political medicine." Sick people, runs this extremist argument, will have to depend on a doctor paid by the government to work only eight hours daily; emergency cases will therefore have to wait until the doctor checks in. Patients will have to

**Many countries have long had compulsory medical insurance. A recent White Paper proposes to revamp, expand, and fortify the thirty-two-year-old British system. Present coverage is 40 per cent of the population; the White Paper proposes that benefits be extended to the entire population. Tax support will supplement the contributory system (at present the contribution is 9 cents a week from every employee and his employer). Whereas the present system rests wholly on the open panel, the White Paper proposes widespread use of "grouped practices." The generally cordial reception given the White Paper indicates that the British public and medical profession want to change the present system by extending it, not by returning to the older system that persists almost intact in the U.S.* FORTUNE *(July) described New Zealand's medical-reform program.*

**This body's policies are approved by the A.M.A. and its Board is largely composed of present and ex-leaders of the A.M.A. Operating on money collected from doctors and drug and appliance manufacturers, it aims to influence legislation by public appeals and by persuading legislators through their personal physicians.*

go to any old doctor assigned by a political bureaucrat and devoid of personal interest in them. The doctor will be insufficiently competent because methods and remedies will be fixed by bureaucratic superiors, paymasters whose approval will be more weighty to doctors than the approval of their patients.

Actually, there is nothing in the Wagner bill about doctors working eight hours a day, or about emergency cases waiting for office hours. The bill declares that patients shall have the doctor of their choice, who would presumably have as much personal interest in them as at present. The bill in no way implies government-prescribed methods or remedies. On the other hand, some objections to the bill cannot be brushed aside. Some progressives argue that any nationwide scheme should be tax-supported and available to all. Some argue that the plan could not everywhere deliver the promised services because in many places facilities and personnel are inadequate. Many advocates of far-reaching changes contend that the bill would leave solo practice about where it is, since doctors would have no added inducement to start group practice. Some advanced medical scientists are inclined to appraise the bill in terms of its effect in developing preventive medicine, especially the health-building (as opposed to curative) potentials of nutritional science; viewed in such terms, the bill leaves them pretty cold.

In any case, it may reasonably be argued that the scheme tends to force doctors in by economic pressure, fails to define the place of voluntary activities, provides for too little participation by doctors and the people served, bucks powerful traditions of decentralized control. Rather than attempt detailed management of a complicated setup, the central authority in Washington might limit itself to providing grants-in-aid to the states and localities, establishing national standards, holding the balance. Many a layman who agrees that something ought to be done is likely to remain appalled and frightened by the proposed colossus, likely to wonder if it wouldn't be better to walk toward medical security—even groping a little, and trying various paths—rather than to leap in with both feet.

The voluntary way

What the moderate citizen wants to know is whether the battle need be fought to a decisive issue between medical laissez faire and state medicine, or whether there is ground for a compromise. Voluntary plans might provide a framework within which doctors could:

a) Strive to keep the medical profession at least as free of the will of the government as are other professions;

b) Protect themselves against exploitation for anyone's private profit (in fact, nonprofit organizations are at the center of almost every proposal that would put doctors on a salary basis);

c) See to it that neither individual doctors nor groups of doctors were forced into any greater competition than naturally exists in a free profession.

Medical fees could be kept at least as stable as in the past without breaking any antitrust laws. The net take of the profession could be enormously increased through increased consumption of medical care. Certainly that half of all U.S. doctors who earn less than $3,000 annually would benefit: salaries in group practice are higher at every age level than comparable private practice average net income. And $50,000-a-year Park Avenue doctors could continue sitting at bedsides on that avenue on the old fee-for-service basis.

Once doctors and hospitals are available, the foundation of a reorganized medical system might be a network of voluntary plans for medical insurance. Because costs are too high under solo practice, group practice would increase. Voluntary prepayment plans attract the worst medical risks and for the success of any broad scheme those who are healthier than the average must help take care of the others. This means that groups such as employees or union or grange members must be taken in, generally to the extent of 75 per cent or more of the total group. Should the healthier members of a group tend to take a chance and stay out, it may be necessary for an employer or a union to stake all members of the group to part of the fees; this will mean that nobody can afford to stay out. Where family dependents on a voluntary basis offer the same danger of bad selection, employers may have to pay part of their way in.

But not even all this would take care of the unemployed, the self-employed, or those working in such small groups as not to be eligible. For those who lose their jobs, there would have to be local, state, or federal government payments to a plan. The problem is more difficult for those who never become eligible by belonging to an employed group of some size. Ross-Loos charges more for them and other plans insist on preliminary physical examinations and/or withhold certain benefits. Perhaps the solution would be to give physical examinations and to have the government subsidize supplementary fees when necessary—temporarily if preexisting conditions can be cured, permanently if they are chronic. The subsidizing of voluntary plans need not necessarily give governments greater control than they should have anyway—such as the states' power to supervise insurance companies. Nor need the participation of laymen in the management of voluntary plans affect medical practice under those plans. Doctors have long accepted the fact that hospitals are run by lay boards, and have known how to keep control of strictly medical matters where it belongs—in the hands of medical men.

Will doctors tolerate a change? The likelihood is increasing. In 1943 the U.S. Supreme Court confirmed the conviction under the Sherman Anti-Trust Act of the A.M.A. and the District of Columbia Medical Society. These organizations had conspired to destroy the Washington Group Health Association—which combined group practice with prepayment—by preventing District society members from working for Group Health or consulting with its doctors, and by restraining hospitals in and about the city from affording facilities to patients of Group Health's physicians. Since the Supreme Court spoke, the A.M.A. has had to tone down its aggressive opposition to new forms. Increasing numbers of its constituent local medical societies have sponsored voluntary prepayment plans such as the A.M.A. once condemned. Throughout the country voluntary groups have experimented with other forms. At the 1943 meeting of the A.M.A. House of Delegates, the outgoing President, Brigadier General Frederick W. Rankin, said that "tremendously forceful socio-economic trends which are involved and deeply concerned with the nation's medical problems" are directed toward "some form of national health service as an integral function of the state." To recognize this, said Dr. Rankin, "must not be regarded in the light of apostasy." And the incoming President, Dr. James E. Paullin, added that the "trend of medical practice inclines toward the establishment of the hospital and medical centers as the source for the

distribution of medical care." When the doctors now in uniform join the increasing numbers of progressive civilian doctors favorable to the new forms of practice, change will be hastened. When medicine is reconverted it will move ahead.

Whether the change will come fast enough and prove effective enough to deflect the solution of the medical-care problem from the channels of federal legislation, is problematical. But it is just possible that voluntary cooperative action of U.S. employers, employees, municipalities,* and other groups will largely solve the problem of medical care without federal legislation. The Committee on the Costs of Medical Care tried to draw the broad framework for a compromise plan. Such a plan would have to safeguard the quality of medical service and the personal relation between patient and physician, while assisting and guiding patients in selecting competent practitioners and suitable facilities. It would have to provide for the development of all preventive and therapeutic services to meet the needs (not just the present effective demands) of substantially all the population on financial terms that the people can and will meet, without undue hardship, through individual or collective resources. In order to permeate all practice with the concept of prevention it would have to provide an adequate public-health program. To individuals and agencies furnishing care it would have to guarantee adequate payment.

No complicated, flexible, voluntary compromise between the status quo and state medicine will have a reasonable chance of growing to meet all unmet medical needs except under two general conditions. The first is that the country be prosperous, with reasonably full employment so that the bulk of the people are able to pay their own contributions without government help. Second, government at all levels, employers, the great mass of potential patients, and, above all, the medical profession must show a degree of social inventiveness and a determination hitherto unknown.

If either of these conditions is absent, the U.S. is probably headed through a spotty and unsatisfactory experience with voluntary medical insurance toward compulsory nationwide insurance. Dr. Alan Gregg of the Rockefeller Foundation thinks that medicine may be in the state that education was in a hundred years ago—moving from a private to a public sphere. The analogy is too close for the comfort of those who want guarantees that medicine will not fall under the control of public servants, those who prefer voluntary methods, dispersed controls, and many minor forms of collectivism to one big collective step. The responsibility of the doctors takes the form of a dilemma that they must face: if they do not themselves aggressively foster and encourage considerable reform in medical economics, they are likely to find themselves swept into something that will seem revolutionary by comparison. By one means or another, medical security is undoubtedly coming. The consumers are making a social issue of it and it will, before too long, be met socially.

**Fiorello La Guardia has projected a so-called Mayor's Plan for health insurance in New York City. This will enroll 150,000 city employees and their families, provided private industry enrolls a like number. The city (or employer) will pay half of each annual subscription fee (probably around $42 per individual, $96 per family), the employee the other half. Full medical and hospital service will be provided, including diagnostic and consulting services. The plan frankly aims to develop group practice, but will give equal opportunity to solo doctors to carry on a competing prepayment plan based on the open panel and fee-for-service. Individual subscribers will be free to choose a solo practitioner or a group.*

RURAL MEDICAL CARE

AND

RELATED QUESTIONS

W. E. Garnett

An address to fourth year medical
students of University of Virginia
December 12-13, 1947

Virginia Polytechnic Institute
Virginia Agricultural Experiment Station
Blacksburg, Virginia

THE VIRGINIA HEALTH AND MEDICAL CARE COUNCIL

Statement prepared by: W. E. Garnett*, Rural Sociologist, Virginia Agricultural Experiment Station, Blacksburg, Virginia, in response to a request from the Chairman of the State and Community Health Planning Section of the National Health Assembly, Washington, D. C. May 1-4, 1948

-----0-----

The Virginia Health and Medical Care Council, now in its third year, was an outgrowth of the Rural Health and Medical Care Survey Committee and its activities over several years. 1/

The Council is supported by over 40 State-wide organizations and agencies interested in health matters. Its chief activities have been: (1) to promote joint effort for better health and medical care; (2) to carry on an educational program designed to arouse popular interest in, and support for advances in medical care; and (3) promotion of legislation for needed health measures (primarily appropriations).

Joint effort through the Council has resulted in health and medical care needs being increasingly considered as a related whole and more effort to fill in needed gaps. It has also resulted in greater team-pull between different groups. The specialized health organizations -- the Tuberculosis Association, Cancer Foundation and Crippled Children's Fund — still maintain their own staffs but have heartily supported the united program. For the first two years the Council functioned through volunteer committees. In September 1947 it employed an able, highly trained director, Mr. Wm. Shands Meacham. Funds for a fairly liberal budget are contributed by member agencies, supplemented by popular contributions.

The educational program has been promoted through meetings of different types-- State-wide, district and local; press articles; radio talks; and popular circulars of which four have been issued to date and distributed by thousands through the supporting organizations.

Virginia has made great progress in gaining legislative support of health during the past four years. The Virginia Health and Medical Care Council as the united voice of many agencies has done much to supplement the efforts of the State Health Department, the Department of Mental Hygiene and Hospitals, specialized health associations and other groups in behalf of such support.

<u>1948 Legislature</u>: Health measures for the 1948-50 biennium include -

I. State Department of Health
   A. Operating budget.
      1. $1½ million increase which will make financially possible -
         Expansion of local health units to full State coverage.
         Expansion of Cancer control work.
         Better care of Tuberculosis cases.
         Treatment of alcoholics at the two medical schools ($100 thousand).

---

* Organizer and director, Virginia Rural Health and Medical Care Survey, 1941-45; Secretary, Survey Public Opinion Committee; Member, Va. 1945-46 Rural Health and Medical Care Legislative Committee; Organizer, Va. Health and Medical Care Council and member of its Executive and other Committees; Member, Va. Advisory Hospital Council; Social-Economic Consultant, Va. Hospital Survey; Member, Va. 1947 Health and Medical Care Legislative Committee; Member Board of Directors, Va. Medical Society's Medical Service Association; Director, Va. Rural Medical Care Insurance Study; Member, Rural Medical Insurance Committee, Second American Medical Association and National Farm Organizations Conference on Rural Health; and author of numerous reports and articles on rural medical care.

B. Capital outlays.
1. $6 million -- approximately -- (unconditional) for capital outlays at Tuberculosis Sanitaria.
2. $2½ million (conditional) for a new Negro Tuberculosis Sanitorium.
3. $1½ million (unconditional) for hospital and health center construction to match Hill-Burton Act funds.
4. $1 million (conditional) for hospital health-center construction.

II. Department of Mental Hygiene and Hospitals
1. $3 3/4 million -- approximately -- increase appropriations including and allotment for a State-wide system of mental hygiene clinics, (with matching funds about $200 thousand will be available for the purpose annually).

III. Other Appropriations and Measures
1. $300 thousand annually for aid to the medically needy to be matched by local government units. (Aid started in 1946; a request to the 1948 Legislature for an increase was rejected.)
2. 25 rural medical school scholarships provided, including five for Negroes; scholarships increase from $5 hundred to $1 thousand per year.
3. 30 nursing scholarships provided.
4. $700 thousand -- approximately -- for expansion of dental education at M.C.V. (capital outlay)
5. Provision for increased inspection of restuarants, tourist homes and filling station rest rooms.

<u>1946 Legislature and 1946-48 advances</u>: The 1946 Legislature did much to advance medical care -- State Health Department's appropriation was increased by nearly $2 million, enabling it to expand its program in several directions; substantial appropriation was made for aid to the medically needy; rural medical school scholarships were increased; around $2½ million was appropriated for capital outlays for Tuberculosis Sanitaria (high cost prevented much building); mental hospitals' appropriation increased, including $9 million for new capital outlays (high building cost prevented expenditure); provision made for hospital survey; Hospital Licensing Bill passed (1947 Special Session); and legislative committee for further health studies provided. (Several legislative reports promoted these advances.)
The period saw a careful hospital survey made and plans for an integrated hospital health-center system developed and approved.

The most important health and medical care problems now confronting Virginia include:

- o -

1. Translating the hospital health-center plans into reality.
2. Developing hospital related, full coverage medical insurance adapted to the needs of all the people, including farm groups.
3. Increased popular understanding of the possibilities of modern medical science and the measures necessary to make it available to all the people.
4. A development of local health and medical care councils to be affiliated with the State Council.
5. Expansion of preventive medical care, especially among school children.

1/ Note: Some Recent Health and Medical Care Developments in Virginia — A Background Statement

Several steps in Virginia health and medical care developments in recent years include:-

1936 - A request by the Federation of Home Demonstration Clubs to the Virginia General Assembly for the creation of a committee to study rural health hospitalization and hospital insurance - request rejected.

1938 - A request to the Virginia General Assembly by the Agricultural Conference Board, (a Federation of 25 farm and home organizations), at the urging of the Home Demonstration Clubs to create a Rural Health and Medical Care Commission - request rejected.

1940 - A request to the Virginia General Assembly by the Agricultural Conference Board to create a Rural Health and Medical Care Commission - request rejected.

1940 - Formation of Virginia Rural Health and Medical Care Survey Committee — organized by W. E. Garnett, Rural Sociologist, Virginia Agricultural Experiment Station, at the request of the Federation of Home Demonstration Clubs after failure of legislative request — composed of officially appointed representatives of the Virginia Medical Society, the two State Medical Schools, Agricultural Experiment Station, Agricultural Extension Service, the Grange, the F.S.A., Farm Bureau, Virginia Agricultural Conference Board, Federation of Home Demonstration Clubs, Virginia Hospital Association, Virginia State College, and State Departments of Health, Education and Public Welfare.

1940-45 - Study of Virginia rural health and medical care conditions by Rural Sociology Division, Virginia Agricultural Experiment Station, supplemented by studies of U. S. Public Health Service. (Completion of both studies delayed by war conditions.)

1944-45 - Formation of Public Opinion Subcommittee under Rural Survey Committee. Request by Rural Health and Medical Care Survey Committee to 1944 General Assembly for creation of Rural Health and Medical Care Legislative Committee — request complied with and several members of Survey Committee appointed to Legislative Committee, thus insuring continuity of thought and effort.

1945-46 - Publication of preliminary progress reports of survey findings and complete survey report. Public opinion campaign conducted by Public Opinion Subcommittee -- five popular circulars prepared and thousands distributed; press articles and radio talks; and meetings held in over 1,000 communities.

1946 - Rural Health and Medical Care Survey Committee re-organized into Virginia Health and Medical Care Council for work on all aspects of health and medical care with the support of over 40 State-wide organizations and agencies.

A representative of the Virginia Medical Society has served as president of the Survey Committee and of the State Council since its formation. As the program progressed the Medical Society has taken increasing interest and given increasing support. Dr. H. B. Mulholland, Ass't Dean, U. of Va. Medical School; Dr. W. T. Sanger, President, M.C.V.; Dr. Geo. Zehmer, U. of Va. Extension Service; Miss Maude Wallace, Director, Va. Home Extension Work; Miss Ellen Smith, Va. T.B. Assoc., and Mrs. Ben Wailes, Sweet Briar, representing the Home Demonstration Clubs, have been especially active leaders in the forward program.

Here's How for Health

By MORRIS LLEWELLYN COOKE

TODAY'S headlines seldom carry good news for liberals. It is therefore all the more gratifying to report that in the long fight to secure adequate medical care for all, a major victory was scored this past month. It came at the National Health Assembly when 600 representatives of the medical and allied professions and popular organizations agreed on a broad program for financing medical care.

The cornerstone which will eventually spell a new era in American medicine is founded upon two provisions of that program:

> **"Adequate medical service . . . should be available to all without regard to race, color, creed, residence, or economic status.**
>
> **"The principle of contributory health insurance should be the basic method of financing medical care for the large majority of the American people in order to remove the burden of unpredictable sickness costs, and avoid the indignities of a 'means test.'"**

Thus, for the first time, spokesmen for the American Medical Association joined with business, labor, farm, veterans, women, consumer, cooperative, and other groups in recognizing health insurance as a vast improvement over the usual system of paying sickness bills by "fees for service."

Moreover, there was a real and long overdue concession from the representatives of organized medicine that the high costs of sickness are now everybody's business, laymen as well as physicians.

Nor were these the only areas of agreement reached at the National Health Assembly. In formulating the nation's health goals for the next decade, these basic principles were unanimously adopted:

One—Voluntary health insurance programs must be encouraged, particularly in rural areas.

Two—Medical and popular groups should work together to remove restrictive state legislation against voluntary plans, originally passed at the mistaken insistence of state medical societies.

Three—Coordinate medical care services and promote cooperation between doctors and laymen concerning professional standards and administrative procedures.

Four—Use tax funds where necessary to supplement health insurance.

Perhaps the major gain of the Assembly is not to be found in a formal resolution. It may reside in the promise of representatives of the American Medical Association to secure future conferences with interested consumer organizations to work out further areas of agreement. The AMA itself may not yet be officially committed to these proposals. Nevertheless, all lay groups will find their position considerably strengthened in their dealings with local units of the AMA.

The behind-the-scenes story of how the AMA spokesmen were converted to supporting these principles—particularly the health insurance principle—is worth reporting. Even before the Assembly opened May 1, it was apparent that organized medicine had its strategy prepared. Through its propaganda machine, the National Physicians Committee, it had sought to discredit the Assembly in advance as a "political health conference." Advertisements in the leading trade papers and canned editorials to this effect were circulated to the editors and publishers of the American press. At the Assembly, organized medicine seemed prepared to continue its delaying tactics against public demands for constructive action to remove the economic barrier presently depriving 100,000,000 Americans of the medical care they need.

Accordingly, the only statement of principles on medical care that AMA spokesmen would agree to at the first meeting of that section was so limited and inadequate that the other delegates were shocked.

BY use of democratic, parliamentary means, however, spokesmen for farm, labor, cooperative, and a host of other popular groups forced a full discussion of national health needs onto the floor. Until the Assembly closed, they hammered home the widespread dissatisfaction of the American people with a number of current practices. Included among these was widespread discrimination against Negroes and other minorities as both patients and prospective doctors; and impatience with the blind resistance of local medical societies to voluntary plans in which responsible representatives of the people who pay the bills would manage funds.

Although agreed on the value of voluntary insurance plans, the delegates of the popular organizations recognized that these plans alone cannot do the job. They therefore made it clear that they agreed with the conclusions of experts like Dr. Michael M. Davis, well-known medical economist, who said: **"Voluntary plans do not offer broad enough coverage at low enough rates to a large enough portion of our people to justify serious consideration as a national solution to our national health problem."**

To assure a fair hearing for this majority point of view, the representatives of 15 national organizations with a combined membership of more than 15 millions, drew up an eight-point program. After a first attempt to rebuff it, the AMA spokesmen in that section were forced by democratic

MORRIS LLEWELLYN COOKE, the consulting engineer, is a member of the board of directors of the Committee for the Nation's Health, Inc. Mr. Cooke has served as special adviser on a wide variety of public and private engineering projects and was formerly head of the Rural Electrification Administration. He is the author of "Academic and Industrial Efficiency," "Our Cities Awake," and "Organized Labor and Production."

pressure to yield on the first six points previously listed.

They refused, however, to concede that under an equitable arrangement the people who foot the bills have every right to handle financial and administrative policy, leaving the doctors free to set professional standards. And, as was expected, they remained adamant in their now familiar, mechanical rejection of national health insurance.

But the acceptance of the first six points of the program marks perhaps the greatest advance in social medicine by doctors in the last 20 years. For it concedes that every American is entitled to adequate medical care as a matter of right, not of charity. And it is reassuring evidence that when liberals are united on a wide front and will stay united, they have the political strength and cogency of purpose to shake even so entrenched a body as the American Medical Association.

On the last point of the program submitted by popular groups—the need for national health insurance—there can be no compromise. Each passing day confirms the fact that we are caught in a national health crisis. Cold statistics shatter the myth that we are the healthiest people in the world. In any 24 hour period, for exemple, seven million people are incapacitated by sickness or other disability. Half of these remain disabled for six months or more. The total annual costs of sickness and disability, including direct wage losses and business costs plus "hidden costs" of loss of future earnings because of premature death and disability, come to more than 15 billion dollars.

In terms of production, 600 million man-days are lost annually. But in the most significant terms of all, human life and health, sickness and disability exact the highest toll. Twenty-three million people suffer from chronic disease or physical impairment. **One out of every two mothers now dying in childbirth and one out of every three babies who die could be saved if they could get adequate medical care.**

These shocking facts are but a few of many more that may be obtained by writing to the Committee for the Nation's Health, 1790 Broadway, New York 19, N. Y. All of them tie in directly with the even more ominous facts about the lack of medical care in this country. **Two out of every three persons—about 97 million Americans—cannot meet serious sickness costs without assistance. This estimate is based on a pamphlet issued by the AMA's own Bureau of Medical Economics.**

Hurry, Doctor!

Burck in Chicago Sun-Times

There is a national shortage of doctors, nurses, hospitals, and general medical facilities. But even more serious is the fact that all of these are not evenly distributed throughout the country. In the best state, for example, there is approximately one active doctor for every 600 persons. In the worst state, there is but one active doctor for every 1,784 persons. Fifteen million persons living in 40% of our counties have no approved general hospital.

The effect of this shortage of medical services in rural areas can be translated directly in terms of human lives lost. In the four best states, 28 to 30 babies died per thousand live births in 1945. In the four worst states, 50 to 100 infants died in their first year.

A national problem of this scope obviously demands nothing less than a coordinated national solution. The most careful thought and planning directed at a workable, middle-of-the-road program has been embodied in a bill now before the Senate called the National Health Insurance and Public Health Act, S. 1320. Successor to the Murray-Wagner-Dingell Bill, this measure is now sponsored by six Senators and two Representatives. It would extend our Social Security benefits so that in return for employer and employee each contributing 1½% of the latter's wages to a national fund, each insured person and his dependents would receive almost complete medical coverage.

The bill specifically guarantees that each patient shall be free to choose his own doctor and hospital. Equally stringent guarantees insure that doctors and hospitals will continue to enjoy the same full professional freedom they have today.

The possible dangers of a costly and inefficient bureaucracy would be eliminated under the bill, since the administration would be handled primarily on a local level by doctors and laymen in each area. The Federal Government is limited to setting broad administrative standards and to the collection of funds for distribution to the states and localities. All the advantages of home rule and local control would be jealously preserved.

Organized medicine, aided by drug and patent medicine companies, has spent more than one million dollars to obscure the clear-cut provisions of S. 1320. Constant attempts have been made to smear it as "socialized medicine which emanates from the Kremlin." Actually, national health insurance is the best possible answer to socialized medicine.

The greatest effort, however, to defeat national health insurance has been made through an admittedly political substitute bill sponsored by Sen. Robert A. Taft and a few other Republicans. This bill, S. 545, is nothing more than a medical dole for the destitute and has been widely condemned as such. It has won no endorsements except a most qualified one from the AMA and its satellites. But those who would play politics with health are using the Taft Bill in an attempt to dam the tide of health insurance.

Our most recent gains, spectacular though they may be, are the fruits of years of tireless efforts. Further gains will come, as in the past, not so much through the efforts of a single individual or clique so much as through the day-to-day teamwork of liberals throughout the country. The opposition has its high-priced lobby. But enactment of national health insurance depends upon a different sort of lobby altogether—a lobby with no selfish purpose, a lobby for lives in which all liberals must participate.

Southern Regional Council

THE SWIFT CURRENT EXPERIMENT

A. D. Kelly, M.B.

Toronto, Ont.

To the student of health insurance, no more interesting experiment exists in Canada today than that which is proceeding in Saskatchewan's Health Region No. 1. The area covered consists of 87 municipalities and local improvement districts in the south-west corner of the province, with a total population of 54,000 persons. The region is predominantly rural, but the city of Swift Current, the towns of Maple Creek and Shaunavon, with populations of 6,200, 1,200 and 1,600 respectively, are included. The principal industry of the region is agriculture, and the economy is subject to wide fluctuations of prosperity and depression. In the "dusty 30's" this area was extremely hard hit, and a relatively large proportion of the people required public assistance.

Several municipalities in the area have had experience in the provision of medical services by municipal-doctor contracts and by local mutual medical and hospital benefit associations. Under authority of the Saskatchewan Health Services Act 1946, the area under discussion was designated Health Region No. 1, primarily for the purpose of providing a public health program in preventive medicine. This legislation provides for the establishment of a Regional Board which acts as a Board of Health for the purposes of the Public Health Act. The Health Services Act, however, provides in addition that, subject to the approval of the minister, a regional board may make arrangements for the provision of medical, hospital, dental, nursing and other health services. It was decided to proceed with this more extensive plan and on July 1, 1946, there was inaugurated in Health Region No. 1 an arrangement to provide all residents of the area with a complete medical and hospital service. Subsequently, the hospital benefit was superseded by the Saskatchewan Hospital Services Plan which provides for compulsory hospital care insurance applicable to all citizens of the province.

At present, 18 months after its commencement, there is provided for the residents of Health Region No. 1 a complete medical service on a more extensive scale than exists for a total population elsewhere in Canada. and the patterns being established may well serve as a guide for future developments. The question may well be asked, is this compulsory health insurance? The plan was set up under the authority of provincial legislation, assented to by a majority of the voters affected, and financed by taxation which is levied on all citizens of the area. In the opinion of the writer, the plan fulfils all the criteria of a plan of compulsory, contributory health insurance, and the question may be answered in the affirmative.

In examining the details of the medical services of Health Region No. 1, Saskatchewan, it is proposed to utilize as a basis for comparison the Principles Relating to Health Insurance enunciated by the Canadian Medical Association in 1944. These Principles represent the policy of the Canadian Medical Association. To facilitate their use as a yardstick against which to measure this example of health insurance, they have been rearranged from their usual order and are quoted in full in the relevant sections of this report.

Scope

All residents of Health Region No. 1 and their dependents, with the exceptions noted hereafter, are eligible for medical service. The present number of insured persons is approximately 49,000. Newcomers to the area for permanent residence are eligible for service in 3 months. The recipients of pensions in the area, such as Old Age Pensions, Blind Pensions and Mothers' Allowance, have medical care separately provided by the provincial government. War pensioners are provided with medical care for their pensionable disability by Federal authority, but in all other respects they are subscribers to the plan of health insurance. Indigents are fully covered, as their contributions are paid for by their municipality. The group of persons just above this income level who are ineligible for municipal assistance are said to represent a problem as they find it difficult to pay the personal tax. This is the group known to the medical profession as medically indigent in that they appear to be able to finance most expenses other than medical. Health insurance should provide the answer to their problem and it is disconcerting to learn that this is not the case.

Residents requiring medical care while temporarily absent from the region are reimbursed for expenditures made up to the amount that the

services would have cost had they been rendered within the Region. Provision is made for contributions to be received from transient workers who come into the region to engage in harvesting, threshing and mining, and they are made immediately eligible for full benefits. One section of the region which is without hospital facilities is not served by a resident practitioner. Consideration is being given to the payment of a subsidy to attract a doctor to the area.

The Principles relating to scope of service are as follows:

Principle 5.—While leaving to each Province the decision as to persons to be included, the plan must be compulsory for persons having an annual income insufficient to meet the costs of adequate medical care.

Principle 6.—The dependents of insured persons should be included in the health benefits.

Principle 7.—Medical care for resident and transient indigents should be provided under the plan, the Government to pay the premiums.

It would appear that, in scope, the application of health insurance in this instance is consonant with the Principles.

BENEFITS

Complete medical and surgical care, with the exceptions noted hereafter, is afforded the residents of Health Region No. 1, and where it is not available from the doctors practising within the region, provision is made for the referral of patients to specialists practising outside the area.

Exceptions to the general provision of complete medical care are as follows:

(*a*) Treatments of a purely cosmetic nature are not authorized.

(*b*) The region assumes no liability for the payment of the cost of lenses, glasses or spectacles.

(*c*) As Provincial facilities are otherwise available, the region does not undertake to provide for the treatment of cancer, tuberculosis, epilepsy or mental disease in institutions. Alcoholism and drug addiction are not treated under the plan. Medical accounts for patients eligible under the Workmen's Compensation Act or the plan for the care of Old Age Pensioners, blind pensioners and recipients of Mothers' Allowance are not a charge against the funds of the region.

(*d*) Mileage is not paid for except in the case of doctors resident within the region who are called in by a colleague in the capacity of consultant or assistant.

(*e*) The services of nurses in the home are not available except under extraordinary circumstances.

(*f*) The procurement of drugs and pharmaceuticals are a responsibility of the patient.

(*g*) Hospitalization is provided separately under the Saskatchewan Hospital Services Plan.

The benefits provided may be more specifically stated as follows:

(*a*) The services of general practitioners. There are at present 34 doctors practising in the region and all participate in the plan by rendering medical services.

(*b*) The services of specialists. Two of the doctors resident in the region are certificated in general surgery by the Royal College of Surgeons of Canada, although neither confines his work entirely to this field. A specialist in radiology, who is stationed at the Swift Current General Hospital, is employed on salary by the Regional Board. His services are available to all doctors and hospitals in the region. The services of specialists in other fields are ordinarily obtained by the referral of patients to centres outside the region.

(*c*) Diagnostic and Out-patient service. Radiological and clinical laboratory facilities are available at several hospitals within the region. Diagnostic problems requiring services and facilities of greater extent are handled by referral to appropriate centres outside the region. The hospitals are reimbursed for the use of their facilities in radiology, minor surgical procedures, laboratory diagnosis, physiotherapy, etc., when these are utilized by ambulatory patients not requiring admission or occupancy of a bed. All such outlay is classified under the heading of out-patient service.

(*d*) Dental services. A reasonably complete dental service is provided for residents of the region under the age of 16 years. The services of private practitioners of dentistry are utilized in addition to the work of three salaried dentists who operate travelling clinics within the area. Beginning January 1, 1948, the utilization of private dental practitioners has been curtailed and it is hoped that the services of the travelling clinics will suffice to render dental care to the youthful population.

(*e*) Preventive services. The region is served by a full time staff in Public Health, consisting of a medical officer of health, seven public health nurses who are certified inoculists, a health educator and three sanitary inspectors. A full program of preventive services is provided and medical practitioners are afforded the opportunity of participating both in organized clinics and in their private practices.

The Principles relating to benefits are as follows:

Principle 1.—The Canadian Medical Association approved the adoption of the principle of contributory Health Insurance, and favours a plan which will secure the development and provision of the highest standards of health services, preventive and curative, provided the plan be fair both to the insured and to all those rendering the services.

Principle 8.—Health benefits should be organized as follows:

(*a*) Every regularly qualified, duly licensed medical practitioner, in good standing in the province, should be eligible to practise under the plan.

(*b*) The benefits conferred should be such as to provide for the prevention of disease and for the application of all necessary and adequate diagnostic and curative procedures and treatment. Specialist and consultant medical services should be available.

(*c*) The following additional services should be available through the medical practitioner: (1) nursing service; (2) hospital care; (3) Auxiliary services, usually in hospital; (4) pharmaceutical service, subject to regulation.

(*d*) Dental service.

It will be noted that the benefits provided in Health Region No. 1 differ very little from those recommended. Hospital care is provided through another agency. Nursing service is limited to that provided in hospital. Pharmaceutical service, however, is excluded, and as this has been a troublesome and expensive feature of certain other plans the omission may not be unwise.

ANCILLARY MEASURES

At present, and for several years past, the people of Health Region No. 1 have enjoyed a degree of prosperity which provides a happy contrast to conditions which existed in the previous decade. This has permitted a satisfactory improvement in living standards which should be reflected in better health. Since the inauguration of the plan of health insurance there has been evident a great demand for the correction of remediable defects which has resulted in a high incidence of operations of election. This in part reflects the natural desire of an insured population to utilize freely the available services, and also suggests that many of these procedures had been postponed during the depression years. It is anticipated that stability in this connection will be reached at a level lower than that which exists at present, but it is not yet evident how long will be required to achieve a normal experience.

Cash disability benefits are not provided in Health Region No. 1 and the institution of this feature is not contemplated.

The Principles pertaining to this section are:

Principle 2.—Inasmuch as the health of the people depends to a great extent upon environmental conditions under which they live and work, upon security against fear and want, upon adequate nutrition, upon educational facilities, and upon the opportunities for exercise and leisure, the improvement and extension of measures to satisfy these needs should precede or accompany any future organization of medical service. Failure to provide these measures will seriously jeopardize the success of any Health Insurance plan.

Principle 9.—Cash benefits, if provided, should not be taken from the health insurance fund.

PARTICIPATION OF PHYSICIANS

All of the thirty-four doctors resident in the Region, or located so close to its boundaries that their practice covers the insured, participate in the provision of medical care to the population by individual uniform agreement made with the Regional Board. This arrangement is made only with fully qualified medical practitioners who are registered in the College of Physicians and Surgeons of Saskatchewan. In this agreement, the doctor undertakes:

"To provide medical and surgical attendance to any resident of Health Region No. 1 in possession of an identification card of Health Region No. 1, signed by the Secretary of the municipality within which such resident resides, to the extent that such medical services can be reasonably expected and safely rendered within the limits of the Region, at the doctor's office, or at the hospital or hospitals at which such doctor usually attends in the practise of his profession, or at the patient's home, when, on account of the nature of the illness or injury such patient cannot attend at the doctor's office."

The arrangement differs in only one respect from the procedure of private practice in that the doctor's account for services rendered is submitted for payment to the secretary-treasurer of the Health Region rather than to the patient. In every other particular the pattern of private practice is preserved, both doctor and patient enjoying freedom of choice, and the referral of patients to specialists is provided for at the discretion of the practitioner.

Undergraduate teaching is not carried out in the Region, but the doctors are as free as other private practitioners to avail themselves of all opportunities for postgraduate instruction which present themselves. Research of a clinical or laboratory nature is not an activity of the plan, but the records which are being compiled will be most useful in respect of statistical investigations into the disability experience of a large insured population, as well as a mine of information for medical economists.

It is the hope of the Health Services Planning Commission that, when the complete medical course is taught at the University of Saskatchewan with its associated University Hospital, there will be a direct connection with regional programs of health services. This may be implemented through the association of regional radiologists and pathologists with their respective Departments at the University, through supervised internships at regional hospitals and through the development of postgraduate instruction centrally and by extension courses. The development of well-balanced group practice units at regional centres will be encouraged.

The Principles relating to this section are:

Principle 4.—It is not in the patient's interest that the State invade the professional aspects of the patient-doctor relationship. Subject to geographical and ethical restrictions this relationship includes free choice of doctor by patient and free choice of patient by doctor; it implies also maintenance of the confidential nature of medical practice.

Principle 13.—The granting of a license to practise medicine was designed primarily to protect the public. Therefore it is in the interests of the patient that all who desire licensure to practise a healing art should be required to conform to a uniformly high standard of preliminary education and of training in the recognized

basic sciences as well as to furnish proof of adequate preparation in the clinical and technical subjects.

Principle 15.—Every effort should be made to maintain health services at the highest possible level. This requires:

(*a*) Adequate facilities for clinical teaching in the medical colleges and hospitals.

(*b*) Postgraduate training of all medical practitioners at frequent intervals.

(*c*) Necessary facilities for, and support of, research.

ADMINISTRATION

The administration of this plan stems directly from the Statutes of Saskatchewan, the specific legislation being The Health Services Act, 1946. This Act empowers the Minister of Public Health to divide the Province into health regions designating them by name and number for the administration of the Public Health Act or of health services provided under the Health Services Act, or both. In the case of Health Region No. 1, both administrative functions have been assumed by the Regional Board, as a result of a poll of the electors resident within the area of the Region.

The relationship of the Provincial government to the administration of public health or preventive services is much more direct than it is to the administration of the curative medical services. The appointment of all members of the public health staff in a region is made by the Provincial Public Service Commission, and the Province assumes the major portion of the cost of the preventive services.

The Health Services Planning Commission is an important body named in the Health Services Act, which functions at the Provincial level. Its members are appointed by the Lieutenant-Governor-in-Council and its powers are broad. For example, the Act states that the commission shall: "Conduct investigations and make such recommendations as it deems advisable to the minister regarding the provision of health services and public health services to any residents of the Province", and "administer any Act or such part of any Act as may be assigned to it",

It would appear that the Health Services Planning Commission is potentially the most important single agency for the extension and administration of publicly financed health services in Saskatchewan. In the personnel of the Commission as currently constituted we find only representatives of the Department of Public Health, that is, medical men who are civil servants. Without disparaging the abilities of the present members of the Commission, it is unfortunate that a broader base has not been established by the appointment of members outside Government circles in order that this important body may be truly independent, representative and non-political.

The Act provides for the establishment of a Regional Board in which is vested complete local authority to supervise the health services of the Region. This is a democratically elected body of 12 members in Health Region No. 1. Each participating municipality in the region elects one representative to a Zone Council and each Zone Council elects two or more members of the Regional Board. Special provision is made for the representation of the city of Swift Current by one member of the Regional Board, otherwise each 4,000 of the population is represented by one member.

It is striking to an outside observer that the Regional Board enjoys such a large measure of local autonomy. Having obtained the concurrence of the Health Services Planning Commission in the general scope of services and in its proposals for raising funds, it is left almost completely to the Regional Board to work out the details. It may be stated that funds for the curative health services are raised almost entirely within the Region and, on the theory of financing known as paying the piper, the marked degree of autonomy may be justified. This situation may also be tolerated since Health Region No. 1 represents the only region of the province which is organized to provide a complete medical care program. When further Regions are similarly organized the need of central administration and control will be more evident if any uniformity in policy, benefits and conditions is to be achieved.

The personnel of the Regional Board in Health Region No. 1 is made up entirely of laymen and no physician is in a position of administrative responsibility. The able administrator of the plan is Mr. Stewart Robertson, secretary-treasurer of the Region, who brings to this appointment considerable experience in the supervision of municipal medical service plans. A Medical Advisory Committee appointed by the District Medical Society advises the Regional Board on matters relating to medical services which may be referred to it. An Assessment Committee of doctors scrutinizes, adjusts and recommends for payment the accounts received from all participating physicians. The Medical Officer of Health occupies an office adjacent to the administrative headquarters of the Regional Board and although his duties do not extend to supervision of the curative health services, his presence is frequently helpful in the interpretation of the medical viewpoint on routine questions.

The Canadian Medical Association Principles relative to administration are as follows:

Principle 10.—Health Insurance should be administered by an independent non-political Commission representative of those giving and those receiving the services. Matters of professional detail should be administered by committees representative of the professional groups concerned.

Principle 11.—Under Health Insurance the Chief Executive Officer to the Commission and the Regional Executive Officers should be physicians appointed by the Commission from a list submitted by organized medicine in the Province.

Principle 12.—Each Province should be served by an adequate Department of Public Health, organized on the basis of the practising physician taking an active part in the prevention of disease.

It will be observed that the actual administrative practice of this plan deviates in several important respects from the recommendations of Principles 10 and 11. The most significant deviation relates to the composition of the provincial administrative body, the Health Services Planning Commission which has been previously noted. At the level of the Region itself administrative responsibility by physicians is absent and, while in the present circumstances, the arrangement has worked with remarkable satisfaction, this may in large part be due to the experience, ability and personality of the individuals concerned. It is our considered opinion that the provision of medical services can best be accomplished with the active participation of physicians in positions of administrative responsibility.

FINANCIAL

The financing of the health services provided in Health Region No. 1 is undertaken principally by taxation applied in the constituent municipalities, supplemented by a contribution from provincial funds. During the first six months' operation of the plan, July 1 to December 31, 1946, hospital care was included among the benefits, but since January 1, 1947, hospitalization has been provided for residents of Health Region No. 1 in common with all other citizens of the province through the Saskatchewan Hospital Services Plan.

The Plan was financed for the first six months as follows: (*a*) by a personal tax of $5.50 per capita with a family maximum of $30.00; (*b*) by a property tax of 1.5 mills on an assessment of $67,000,000; (*c*) by a government grant for organization, public health, radiological and dental services. Actual receipts for the period were:

Personal tax	$239,682
Property tax	99,848
Government grant	17,651
Sundry	116
Total	$357,297

Expenditures during the six months of 1946 in which the plan was operative exceeded revenue by a considerable amount, giving a deficit of $79,373. This deficit was attributable to two factors: (*a*) the total income was less than anticipated in view of the fact that the population proved fewer than originally estimated; and (*b*) the cost of hospitalization was underestimated by approvimately $75,000. This was due to greater utilization and higher costs of hospitalization than had been predicted.

For the calendar year 1947 the revenues to be raised in Health Region No. 1 were adjusted as follows: (*a*) personal tax—$10 for a single person, $20 for a family of two, $30 for a family of three or over; (*b*) property or land tax—2 mills on assessed value of property; (*c*) the provincial contribution in the form of grants mainly for preventive and diagnostic services covered the following items: (1) A flat grant of 25c per capita for general medical care and public health services. (2) Half the cost of radiological services. (3) Half the cost of dental services. (4) Half the cost of out-patient services. Under this heading the Region actually received from the Province in 1947, $76,537, which is 11% of the total expenditure.

For the year 1947, the revenue and expenditures were as follows:

REVENUE

Personal tax	$376,012
Land tax	139,000
Grants	76,537
Sundry	1,390
	$592,939

EXPENDITURE

Medical services:		
(*a*) Within the region	$401,453	
(*b*) Referrals outside the region	58,547	
		$460,000
Out-patient services (x-ray, laboratory, physiotherapy, operating room, etc.)		50,000
Dental services:		
(*a*) Regional dental clinics	$ 18,697	
(*b*) Services of private dental practitioners	22,000	
		40,697
Radiological services (regional)		11,177
Administration		23,570
Commission (to municipalities for collection)		15,000
		$600,444

It will be noted that there was an operating deficit of $7,505 in 1947.

The remuneration of the members of the medical profession who render service to eligible residents of the region is based on fee-for-service at a rate of 75% of the 1938 schedule of fees of the College of Physicians and Surgeons of Saskatchewan. This percentage was arrived at by negotiation before the commencement of the plan, and has been adhered to ever since in spite of the fact that a new contract schedule of fees has been elaborated in the province, which is designed for application without discount to other forms of contractual arrangements for medical services.

The Regional Board, recognizing that no reliable figures were available covering per capita cost of medical care under conditions as they exist in Health Region No. 1, decided to underwrite the total cost without imposing an arbitrary ceiling. It is the hope of the Board and the participating physicians that at the end of two years' operation, it may be possible

to forecast with relative accuracy the cost of medical services in a normal year of stabilized practice, and that a budget may be drawn up to provide the needed revenue.

The remuneration of the doctors reflects the volume of work done and during the calendar year 1947 the average gross income of the 34 participating physicians of the Region from this source was $11,807. In assigning net figures it should be estimated that the expenses of practice amount to approximately 35% of gross income.

For the year 1948 it has been decided that revenue within the region shall be raised on the following basis: (*a*) personal tax—$15 for a single individual, $24 for a family of two, $30 for a family of three, $35 for a family of four or over; (*b*) land tax—2.2 mills on the assessed value of the property.

A typical family of four or more persons resident in Health Region No. 1 will, during 1948, make the following contributions for complete health services. (1) Personal taxes (*a*) for medical and surgical care, $35 (family maximum); (*b*) for hospital care, to Saskatchewan Hospital Services Plan, $20 (family maximum $30). (2) Property tax, 2.2 mills on the assessed value of land.

The Principles relating to the financial aspects of a plan of Health Insurance are as follows:

Principle 16.—The principle of insured persons being required to contribute to the insurance fund is strongly endorsed.

Principle 17.—Any Health Insurance plan should be studied and approved actuarially before adoption and thereafter at periodic intervals.

Principle 14.—The method, or methods, of remuneration of the medical practitioners and the rate thereof, should be as agreed upon by the medical profession and the Commission of the province.

Principle 3.—It is not in the national interest that the State convert the whole medical profession into a salaried service.

It is evident that the financing of the plan is in essential harmony with all our principles. The personal tax provides for the contribution of all insured persons. In the absence of a firm basis of actuarial soundness the Regional Board has displayed a commendable willingness to provide the funds actually necessary to furnish the benefits and the financial structure has been adjusted on three occasions to meet varying circumstances. The fee-for-service method of remuneration which is favoured by the medical profession has been adopted for the payment of practising physicians. Only two doctors, the radiologist and the medical officer of health, are remunerated by salary.

CONCLUSIONS

An observer visiting the Swift Current headquarters of Health Region No. 1 gathers the impression that here is a successful experiment in the large-scale provision of medical care, courageously applied, efficiently managed and remarkably free from attempts to make the facts fit preconceived ideas, financial or otherwise. The long-term view may well be taken that a recession in the economy of the Region may make it difficult or impossible to raise funds on the present scale, but this observation should not be regarded as a criticism of the current endeavour but rather as a statement of the conviction that plans of this type should be so broadly based as to minimize the effects of local variations in prosperity.

The insured population of the Region is enjoying medical service of a high quality and there is ample evidence that their demand for the services of doctors has increased since the inception of the plan. This is a factor of fundamental importance which should be reckoned with in any plans for the extension of medical services on a prepaid basis, as it is the expression of the human tendency to use freely services which do not require additional outlay at the time they are sought.

The participating physicians appear to be satisfied with the operation of the plan which differs so little from conditions of private practice. The medical population of the region has increased from 21 to 34 during the period July, 1946, to December, 1947, and the current physician-population ratio is of the order of 1:1,530. The high demand for medical care has had the effect of increasing the work of the individual physician and in general the impression is gathered that doctors are carrying the maximum load which is desirable in the interests of their health and efficiency.

While the provision of medical care remains local in its application, the administrative machinery which is now functioning is adequate though not ideal. The assumption by other Health Regions of similar responsibility for financing health services would demand the immediate reorganization of administrative bodies at provincial and regional levels. In this reorganization it is to be expected that the provincial authority would assume a greater measure of policy-making control with a consequent reduction in the authority and autonomy now exercised by the Regional Board.

New ground is being broken in Health Region No. 1. On all sides one hears the plan referred to as an experiment, and so it is. It is fitting that all concerned should observe its progress with scientific detachment and learn the lessons which will be disclosed with this application of the experimental method to medical economics.

Mr. Boyd

COPY

IMMEDIATE RELEASE SEPTEMBER 2, 1948

STATEMENT BY THE PRESIDENT

In January of this year I asked Oscar R. Ewing, the Federal Security Administrator, to undertake a comprehensive study of the possibilities for raising the level of the Nation's health and to report to me feasible goals which might be realized in the next decade. The report of the Administrator, entitled, "The Nation's Health -- A Ten-Year Plan," has now been transmitted to me.

This report is an impressive document, which describes where we are today with respect to the health of our people and the goals toward which we must move. The report recognizes the great advances that we have made in recent decades toward improving health and relieving suffering. It makes equally plain the additional progress we must make, and it outlines a series of objectives which will be important guides for years to come to all who are working to improve the Nation's health.

The report demonstrates that we now have, and will face for years to come, serious shortages of doctors, of dentists, of nurses, of hospitals and other medical care facilities. These shortages, together with the fact that millions of our citizens cannot afford good medical care, are the principal obstacles which must be overcome if we are to bring good health within the reach of everyone in this country.

These facts further emphasize the need for the national health program which I have previously recommended to the Congress. That program includes five major points:

1. Adequate public-health services, including an expanded maternal and child-health program.

2. Additional medical research and medical education.

3. More hospitals and more doctors--in every area of the country where they are needed.

4. Insurance against the costs of medical care.

5. Protection against loss of earnings during illness.

I believe that Federal legislation in accordance with this program would carry us far toward the objectives stated in this report. However, more than Federal legislation is needed. State and local governments, medical schools of all types, hospitals, members of the medical professions and other interested groups and citizens will all have to work together if we are to reach our objectives.

For this reason I believe that the National Health Assembly, which met last May, was an extremely important gathering. This Assembly, consisting of more than 800 professional and community leaders, reached a wide area of agreement on the Nation's health needs and on ways and means of meeting them. Except for the recommendation for national health insurance, the Assembly's conclusions support every major recommendation of this report. The Assembly indorsed the principle of contributory insurance as the basic method of financing medical care for the large majority of our people, but took no position for or against national health insurance.

No health program, of course, can stand alone and apart from the economic and social circumstances of our citizens as individuals and as families. Our boys and girls and men and women will gain and hold good health not only from a sound health program, as such, but from decent housing, from adequate nutrition, and from proper education. It is clear that only as we move forward with a broad program to benefit the well-being of all our people will we be able to achieve the kind of health of which this Nation is capable.

The principal value of this report is that it outlines broad objectives and definite methods for achieving them. We can have more hospitals, more doctors, more dentists, more medical specialists of all kinds. We can provide better health care for all the people of our land. I heartily commend this report to every citizen who looks forward to these goals.

To Improve the Nation's Health

We must provide far more facilities and make better use of our present ones, says a Federal authority.

By OSCAR R. EWING

HEALTH is everybody's business and everybody must make it his business. Because of the nature of the problem, government on national, state and local levels must inevitably play an important part. But the real impetus must come from the people. We must dramatize the health problem and organize our resources in an effort to solve it.

These observations stem from an appraisal of the nation's health resources which I have just submitted to the President in a report that also embraces a ten-year plan for integrating and expanding those resources. The report was prepared in response to a request of the President made to me last January.

To find a firm groundwork for the analysis, I convened a National Health Assembly in Washington. More than 800 representatives of public and private agencies concerned with health took part in the discussions. All of these men and women had a realistic approach; they knew the problem not merely in terms of charts and statistics but in terms of sick and worried human beings. My report to the President drew largely on the "grass-roots" findings of the Assembly, though in some instances, I have gone beyond its recommendations.

To grasp the scope of the enterprise we are setting in motion one must sketch in something of the health picture as it is today—the wide gap between our existing resources and what is needed to accomplish our purpose.

WE have made tremendous medical progress over the past fifty years. Our general death rate has been lowered in the area of infant and maternal mortality. We have made great strides in reducing the dangers of communicable disease. Our public health services have undergone considerable expansion, notably in the care of mothers and infants and in the field of sanitation. We have the finest hospitals to be found anywhere and during both the depression and the war years we built a great many modern hospitals, many at Government expense. There is much other evidence of real progress.

But—and it is a big drawback—much

OSCAR R. EWING, Federal Security Administrator, recently submitted a comprehensive report entitled "The Nation's Health—A Ten Year Plan", which was commended by President Truman as a basis for a far-reaching national health program.

To Improve the

of this progress has been unevenly distributed throughout the nation. Good health varies widely among states, among localities within the states, among age groups and income levels. Most of our modern hospital facilities are concentrated in the larger urban centers. These centers also serve to attract a majority of our practicing physicians, dentists, nurses and laboratory technicians to the detriment of other communities.

BROADLY speaking, our small towns and rural areas are still getting the short end of it. The distribution of doctors varies as much as one for every 500 of population in a state like New York to one for every 1,500 in Mississippi. In the distribution of pediatricians, only 4 per cent are practicing in areas where 60 per cent of our children are living.

In 40 per cent of our counties, in which live over 15,000,000 people, there are no registered general hospitals. Our public health services are seriously understaffed and, except in a few fortunate communities, can perform only a part of their prescribed functions. There are 40,000,000 people living in areas which have no full-time local health services.

Moreover, we are dealing with a problem which encompasses some 25,000,000 victims of chronic diseases of one sort or another—over one-sixth of our population. Gradual control of such deadly menaces as tuberculosis, diphtheria, pneumonia and typhoid, has been succeeded by an increase in deaths from cancer and diseases of the heart. Between them these two account for nearly one-half of our annual death rate. In addition we have seen a steady increase in mental disorders to the point where it is now estimated there are at least 8,000,000 persons in need of some sort of treatment.

Approximately 250,000 men and women join the ranks of our civilian disabled each year because of accidents, disease or congenital defects, and require not only specialized medical care but also vocational retraining to enable them to earn a living. And our lengthening life expectancy has brought to sharp focus the problem of the diseases of old age.

THE situation among our children is, in many respects, frightening. Some half a million boys and girls have orthopedic or plastic handicaps. Some three-quarters of a million are victims of cerebral palsy or infantile paralysis or have diabetes, tuberculosis or epilepsy. It is estimated that 500,000 children suffer from rheumatic fever, and from rheumatic heart disease. A million youngsters have hearing defects, 4,000,000 visual defects, and at least 20,000,000 are in need of dental treatment. There are no figures for children suffering from some form of mental unbalance, but the number is believed to be alarmingly large.

Aside from the shortage of physicians, dentists and nurses, there is a lack of sufficient hospital facilities, diagnostic clinics and public health services. Moreover, the cost of adequate medical care is beyond the financial means of half the population. Millions of families can usually afford to visit a doctor only on urgent occasions. Hospitalization, for even a brief period, knocks the family budget galley-west. The protection of periodic check-ups, of preventive treatment—the vitally important stitch-in-time—is enjoyed, for the most part, only by the comparatively well-to-do.

This condition has been mitigated to some extent by the development of Blue Cross prepayment plans for hospital care and Blue Shield plans for medical care. There has been a healthy growth of medical-care cooperatives among farmers, and within certain industries and labor unions. But many hospital plans cost too much for people in the low income brackets. And the cooperatives are limited in scope, particularly in rural areas, because of the lack of proper hospital and other facilities.

MOREOVER, these prepayment and cooperative plans reach only a fraction of the population. For millions of the poor and underprivileged there is nothing which even approaches adequate medical care; they can secure emergency hospitalization only as "charity" patients in a community-sponsored hospital, where the ward service is often admittedly of an inferior nature.

Beyond all this quite a few community hospitals refuse admission to Negroes and others of certain foreign extraction. There is a great dearth of Negro doctors, since Negroes are barred from most medical colleges. Racial discrimination is an ugly fact not only in the South but in the northern areas of Negro concentration.

All these factors are set forth and documented in my report to the President. The recommendations cover our needs for expanded facilities and services, item by item, over a period of ten years and

Nation's Health

carry, whenever possible, an estimate of the cost involved.

FOR example, our medical personnel numbers only about 80 per cent of what is needed. To achieve even in a small measure our goal within the next ten years it will be necessary that over and above the expected production we recruit and train 15,000 more doctors, 5,000 more dentists, 40,000 more nurses and several thousand more laboratory technicians. To do this we shall have to establish, with Government help, medical colleges at key points throughout the country and to supply some measure of Government financing to expand the facilities of existing colleges.

Through Government funds or voluntary gifts, or both, we shall also have to arrange for scholarships which will enable talented young men and women to undertake the long and expensive training leading to a professional degree.

Our plans call for double the number of non-Federal hospital beds now available. At present we have 1,019,000 non-Federal beds, about 15 per cent of which are in buildings that do not meet established standards. We shall need at least some 900,000 more beds, with special emphasis on facilities to care for mental and chronic diseases.

This, of course, entails an enormous hospital building program. A start has already been made. Under the Hospital Survey and Construction Act of 1946, the sum of $375,000,000 was authorized to be spent over a five-year period, on a matching basis of $1 of Federal money for every $2 of state and local funds. Some construction is under way, but unfortunately sky-rocketing costs have made the original estimates obsolete.

To meet even 67 per cent of our admitted hospital needs over the next ten years will require at least $6,000,000,000. Since the pressure on state and local financing will be heavy, we are urging that the Federal Government bear at least two-fifths of the cost, instead of one-third.

BEYOND that, the cost of maintaining and operating voluntary hospitals has increased enormously within recent years and the annual deficits have assumed bewildering proportions. If these hospitals are to survive it will be necessary for the Government to provide, by one means or another, some measure of subsidy to lighten the burden.

Along with our hospital-expansion program, our plans call for an integrated hospital system. Such a system would comprise a series of units in every state which would include every hospital service from the local diagnostic clinic to the modern base hospital, or medical center.

Within the past few weeks the New York State Joint Hospital Survey and Planning Commission has recommended the establishment of several such units for New York State alone, and its program may well serve as a model for the rest of the country. Such a system would permit any patient in need of special treatment, no matter where he lives, to be sent to top specialists. It would serve as a medium of exchange of information and technique for all physicians in the area. And it would encourage physicians to seek practice in the more sparsely populated areas.

OF equal importance is the necessity of coordinating all the health activities in any given community. Hospitals, physicians and public health services should work much more closely together. In many communities there are private or semi-public groups working in such special fields as nursing services or school health. There are also, usually, local chapters of national organizations concerned with cancer, tuberculosis, heart disease and similar problems. Many of these activities overlap. Most of them are focused chiefly on their own individual objectives and, even at that, deal with only a small sector of the particular problem.

The experience of New York City has shown that when the activities of voluntary agencies are closely coordinated with those of the public health agencies, the total combined increase in effectiveness is astonishing. A coordination of all health activities within the community, with a pooling of all their resources, would go far toward bringing adequate medical care to the entire community.

It is easy to see what is necessary in the solution of these problems—money. If a way can be found to provide funds for adequate medical service for those who cannot themselves pay, we can rapidly wipe out our health deficits. If the money is available to pay for adequate medical service, then it is fair to assume that the necessary personnel and facilities will follow as a matter of course. But how to get this money is the $64 question.

SO far as I can see, a national health insurance program is the only answer. I recognize that many serious objections have been made to such a program. But when what can fairly be argued in opposition is weighed against the good points, it seems to me the arguments overwhelmingly sustain national health insurance. After all, we are dealing with human lives and human pain and anguish. Every year 325,000 people die whom we have the knowledge and skills to save. This stark fact proves conclusively that the present system is inadequate. Under it, only the well-to-do and in some measure the charity patients are adequately cared for, but not the in-between groups—other than the fairly small portion who are covered by voluntary in-

surance plans. I see no possible way to provide the funds for adequate medical services to these in-between groups, who constitute the vast majority of our people, except through national health insurance.

To the average citizen such a plan will seem somewhat breath-taking in its scope and implications. I, myself, am somewhat appalled when I consider the vast amount of energy which will be required to translate it into reality. Each state will be required to evaluate its own health resources, map out its health needs and lay down a plan of operation. Committees will have to be formed in every community not only to arouse public interest in the plan, but to work out in detail the effective integration and coordination of all local health services.

These committees—or people's health lobbies, as I choose to call them—should not only include representatives of health groups and agencies, but of civic organizations, trade and professional groups, women's clubs, churches and trade unions. Selfish interests, personal prejudices and racial discrimination must be overcome in order to concentrate on the single objective of good health for everyone.

I am convinced we can make this program work. We have the skill and the knowledge. We will have the resources. Our job is to organize resources, skill and knowledge, to make them available to every man, woman and child in the land.

If we do this we can reduce sickness and disease to a degree no other nation has ever dreamed of. We can erect a standard of health to which all the peoples of the earth will look with envy and admiration, as an example of a great democracy in action.

Dear Mrs. Simpson:

Thank you for your letter of September 27th. I am glad to know that the material we sent you on national health insurance will come in handy. I look forward very much to receiving the NEW SOUTH. You, of course, will get our material in exchange -- a helpful swap for both of us.

In a few days, I hope to send you some mimeographed copies of various editorials in leading Southern papers commending Ewing's ten-year health program, submitted to President Truman. You might find them useful.

Sincerely yours,

Frederick E. Robin

Dear Friend:

Mental illness is not a disgrace. We must face the fact that one out of every ten Americans will need psychiatric treatment, that one out of every twenty will at some time be confined in a mental hospital. Many thousands of patients in our mental hospitals could be restored to normal, useful lives. Other thousands could be spared ultimate breakdown and hospitalization if proper facilities for preventive care existed. But a public policy of penny-pinching and neglect have kept us from taking full advantage of the great discoveries of modern psychiatry that could save countless human beings once labelled incurable.

Our rich country, proud of its medical leadership, dooms a large percentage of its 600,000 mentally ill patients to decay in public institutions that are little better than concentration camps. We spend an average of only $1.60 a day to provide medical attention, food and lodging for a patient in a public mental hospital, while more than $11.00 a day is spent on the average patient in a general hospital. In the best of our institutions, skillful and conscientious physicians and nurses struggle against overcrowding and inadequate facilities. In the worst, underpaid and overworked staffs have succumbed to callousness and brutality.

It is to the credit of the National Mental Health Foundation that the truth about deplorable conditions in public mental hospitals has now become known to millions of Americans. Today we of the Foundation are faced with a still greater task. Prevention and treatment of mental illness must become a primary concern of our citizenry and public officials. The enclosed booklet tells how the people of Oklahoma responded when they learned of the mistreatment of the mentally ill in their state. We are convinced that the same reforms can be carried through in every state in the Union where necessary, if only all of us do our part.

We ask from our fellow citizens $125,000 for our work during the next half year. We must be able to answer the innumerable appeals for assistance that come to us from groups and individuals who are working to end the shameful treatment of the mentally ill in their communities. We count on your assistance in wiping out this national disgrace. Please help.

Sincerely yours,

Harry Emerson Fosdick

OKLAHOMA ATTACKS ITS SNAKE PITS

By MIKE GORMAN

Reprinted from the READER'S DIGEST, September, 1948

Patients in an American Public Hospital for the Mentally Ill

OKLAHOMA ATTACKS ITS SNAKE PITS

I HAD just returned from a happy honeymoon in July of 1946, and was scheduled to take over the city-hall run for *The Daily Oklahoman*. I had sought out the air-conditioned luxury of the city room and was enjoying peaceful reveries of a great career as a municipal reporter when a loud-mouthed copy kid informed me that Harold Johnson, assistant managing editor of the paper, wanted to see me.

Johnson told me that E. K. Gaylord, our publisher, had received a complaint about conditions in the biggest mental hospital in the state. It came from one of Oklahoma's leading bishops; he had just visited a relative who was a patient there, and thought the paper ought to publicize the hospital inadequacy.

Johnson asked me if I'd go down to Norman, the site of the hospital, 20 miles south of Oklahoma City, and do a factual article on the physical conditions, food, treatment of patients, and so on. It was a frightfully hot day, and a hot July day in Oklahoma is just ten degrees above mean temperature in a blast furnace. I wasn't very enthusiastic.

Norman is a lovely little university town, and as I walked along the tree-lined streets with their pretty white homes, I began to feel a little better. Besides, the approach to Central State Hospital was most attractive; I ambled past well-kept lawns to the main administration building, a well-built, two-story brick affair.

Dr. D. W. Griffin, the hospital's superintendent, came out to greet me. In his 70's, and walking haltingly, he was the most tired, anguished-looking man I'd run into in my entire newspaper career. He had been at Norman since 1899, eight years before Oklahoma achieved statehood.

I told the doctor what I wanted. He was very cooperative, asked me where I'd like to start. I said I didn't know; I had never been in a mental hospital before.

We started out at Hope Hall, the general receiving building. When the guard unlocked the big iron door and let us into the first ward, an awful stench hit me across the face. There was not one fan, and the temperature was 95 degrees in the shade.

Walking down the center of the ward I saw a patient climbing over the end of his bed to get to the floor. Rather odd, I thought, until I saw the beds were jammed so closely together that it was the only way a patient could move about.

The next two hours were a series of spine-shattering shocks: patients writhing and groveling, even on toilet floors; constant moanings and screamings; seclusion cells where patients, seen through peephole slits in the iron doors, thrashed about naked; and everywhere dirt and filth.

The superintendent looked at his watch, said the psychotic females would be eating now—would I like to see it? I certainly wouldn't, I thought, but I told him I would like nothing better.

That dining room made Dante's *inferno* seem like a country club. Five hundred mentally sick people jammed their way into a filthy hall only nine feet high. There were big holes in the floor, and several patients took bad falls as they pushed their way in. One elderly woman caught her foot in a foot-long gap and went down with a resounding thud; the patient next to her, laughing loudly, pulled her up by the hair.

The women fought for seats on long wooden benches. They were packed in so closely they had to keep their elbows close to their sides as they ate. The food was "served" by fellow patients because there weren't enough attendants to go around. Each woman had a round aluminum pan into which the food was flung by the servers. Sometimes the food missed the pan and splattered all over a patient. When this happened other patients would howl and point at the victim.

I barely managed to get out of the building before I threw up. As I stood clutching the wall, retching, a gray-haired patient started pounding me on the back.

From there we went to the ward for seniles. Here was the biggest heart-breaker of all—over 1000 unfortunates living out their last days in unbelievable squalor. In the old women's sections there wasn't even space for slop jars on the floor; many of the women had them in bed with them, alongside cookies, candies and other foods.

About four o'clock we got back to the superintendent's office. With 20 pages of notes, sweat-stained and crumpled, I thanked Dr. Griffin profusely and walked out into the summer twilight. I was never so glad to get out of any place in my life.

Riding back in the bus I looked around at the passengers. There were pretty girls looking fresh and cool in their latest summer frippery. The men were in light tropicals and Palm Beach jobs. Then I looked down at my powder-blue slacks and white shoes. I just shook my head.

Back at the office I whacked out a fiery lead, pulling in Dante's *Inferno*, Palm Beach suits and the rottenness at Norman. Then I tried to slide into the story. I went along all right while I was describing the physical squalor. Then I tried to describe the various types of patients. The keys stopped clacking. I looked up "schizophrenic" in the dictionary.

I rolled along for a few more paragraphs, then looked up "psychotic." Reading what I had written, I then did something I had never done before as a newspaperman: I jerked the copy out, rolled it into a small, angry ball, fired it into the wastebasket and headed for home.

As soon as I got there I spilled everything to my poor wife. We sat up and talked until 3 a.m. I told her I was ashamed because I couldn't write the story. She said maybe I could write it in the morning.

Next morning I went to Johnson and told him what had happened. He looked a little surprised, but asked me what I wanted to do. I asked him if I couldn't do a job on all the mental hospitals in the state. He frowned for a moment, then said he thought it would be a fine idea. How much time would I need?

A couple of weeks, I guessed.

"O.K. boy, hit it hard," he said.

Those were the only "instructions" I ever got. Later I asked him for a photographer. I said I wanted a guy who didn't vomit easily. He gave me George Tapscott, who had been a combat photographer in Italy and Germany with Oklahoma's famed 45th Division.

We Tour the Mental Hospitals

TAPSCOTT and I started out the second week in July. Our first stop was back at Norman, where we spent three days casing every inch of the place. Then on to Eastern Oklahoma Hospital at Vinita, Northern Oklahoma Hospital at Enid and Western Oklahoma Hospital at Fort Supply. Each turned out to be a witches' brew of jangled minds rattling about in cobwebbed filth and misery. Touring the central kitchen at Fort Sup-

ply, I got so mad I turned on the superintendent and let him have it. Foot-long gaps in the floor, broken pipes, 19th-century steam kettles, a low, shedlike ceiling which kept out all air – it was more gruesome than the Black Hole of Calcutta. But at Taft, mental institution for Negroes, I witnessed the most galling thing I had seen on the entire tour: little children, adult mental defectives, epileptics, schizophrenics and tuberculars, all mixed in the same wards.

Our last stop was at Pauls Valley, where the home for epileptics was located in the center of some of the loveliest livestock and farming land in the state – Oklahoma's famed short-grass country. This instiution was another pit of despair, presided over by one old, very tired doctor. On tour of the hospital we had to climb over the prostrate bodies of patients lying about the grounds in convulsive states, unattended by any hospital personnel.

When I got home my wife let out a yelp. "What happened to you?" she cried.

She hustled me off to the scales in the bathroom. They registered 170. Now I knew what she meant. I had lost exactly 17 pounds.

I plopped wearily into a chair. The whole business sat on me like a two-ton incubus. Sunday my wife and I drove out to a nearby lake. I sat on a bench by the lake for four hours, just staring at the water. I suppose the psychiatrists would say I was, subconsciously, trying to clean some of the stuff out of me by projecting myself into the water. Maybe. I was too tired to know.

Monday I came down to the office and worked all day on an outline for the enormous mass of undigested notes.

Tuesday I started to write. The first few paragraphs went off all right. Then I started to describe the medical staff at Norman, how inadequate it was. But how inadequate was it?

I went over to Harold Johnson. "Harold, how many doctors ought there to be in a mental hospital which has 3,000 patients?"

"How should I know?" he answered. "Don't you?"

"No. And how can I judge the Oklahoma hospitals until I know what other hospitals are doing; what standards, if any, there are?"

"All right, go ahead," he sighed. "Come back and tell me when you have your degree in psychiatry."

For the next two weeks I boned up on every piece of psychiatric literature I could get hold of. I consulted the bibliography in Dr. Karl Menninger's *Human Mind,* went to a bookstore and picked up seven texts in psychiatry. I wired the National Committee for Mental Hygiene, the National Mental Health Foundation, the American Psychiatric Association, the American Psychoanalytic Association, the Menninger Foundation, and every other organization in the field. I went to secondhand bookstores and picked up old issues of *Mental Hygiene* and *The American Journal of Psychiatry.* I talked for hours with Dr. Hugh M. Galbraith, the city's top psychiatrist, who had spent five years as assistant superintendent of a state mental hospital in New Hampshire. As I sat in the city room picking through the pile of books and magazines in front of me, my fellow reporters would come by the desk, look me over and shake their heads sadly.

When I finished the "thing"—we all then referred to it wearily as the "thing" —I lugged the 80 pages of copy over to Harold Johnson. He smiled wanly and pulled out his red pencil.

Next day when I arrived at the office there was a note in my mailbox from Harold. It said: "You've done it, boy."

That was all. But it was plenty.

The People React

Now, *The Daily Oklahoman* is a conservative family paper. It long ago acquired the nickname "The Great Moral Daily." Could it afford to print George Tapscott's photographs, 35 of the grisliest pictures you've ever seen? Some of them showed patients groveling about the floors and wards sans the slightest stitch of clothing. The pictures were referred to the publisher for decision.

In his 70's, E. K. Gaylord is still in the midst of every Oklahoma battle for civic improvement. Nevertheless, advanced social welfare and psychiatric movements were as unfamiliar to him as they were to the average Oklahoman. The main elements in Gaylord's pioneer struggle to remarkable success had been physical ones—building a state and developing a vast communications empire.

We had not long to worry, however. After he had finished looking through the pictures, he turned to his managing editor and asked: "Were these pictures taken in the mental hospitals?"

"Yessir."

"Well, what are we waiting for? Run 'em!"

The first article of the series took up the entire front page of the feature section, and smack in the center of the page, six columns wide and two thirds of the page deep, was a frightful picture taken in one of the women's wards. Many of my friends told me later that they lost their breakfasts after looking at it.

The banner head, splashed across the top of the page in 72-point type, read: MISERY RULES IN STATE SHADOWLAND. An editor's note warned squeamish readers: "This story is not easy or enjoyable reading." The article began:

> In many ways the treatment of our mentally ill in Oklahoma today is little better than in the times when they were chained in cages and kennels, whipped regularly at the full of the moon and hanged as witches.

Three more Sunday full-page layouts followed. Picture after shocking picture smashed at the readers. Weekday articles on the various state institutions hammered home the points.

The first article, after cataloguing ten major and 22 important additional deficiencies of the mental hospitals, concluded this way:

> The above list of deficiencies merely scratches the surface. It doesn't take into account the many shortcomings of the state board of affairs in its outmoded supervision of all state mental hospitals; it doesn't point out the fact that Oklahoma does not possess one child-guidance clinic designed to diagnose and treat the behavior problems of childhood forerunners of mental breakdown in maturity. Further, it doesn't even begin to suggest the frightful squalor these unfortunates live in – the terrifying atmosphere of hopelessness in institutions where thousands of patients are penned in day after day and night, endlessly starting at blank walls.

The office phones began ringing madly, and letters poured in—over 300 a week. They came from ministers, legislators, educators, former mental patients, relatives of mental patients and just plain citizens.

A woman reader in Woodward wrote: "Several people have suggested you put this series in pamphlet form and distribute it to every member of the legislature the day the session opens. If you do this it will be the finest service you've ever rendered the people of Oklahoma. I have a son in one of the mental institutions, and I'd be more than willing to contribute a sizable sum to defray the cost of printing."

We got scores of letters like that. We got poems from former mental patients. We got proposed bills from candidates for the legislature. We got demands for investigations from veterans' and other civic organizations.

The avalanche can be summed up by a quote from a reader in Kingfisher: "I find the inevitable reaction to your articles is horror and a wish to do something about these conditions. What can we do *now?*"

That is characteristic of the Oklahoma spirit. To the writer, a native New Yorker who bought a one-way ticket out of there in 1945 to get away from that jaded "we've seen everything" attitude, Oklahomans will always be a strange and wonderful breed of people. It takes a lot to get them started, but when they've made up their minds, they want to act in a hurry.

Top management at the paper decided, with Gaylord waving an impatient go-ahead, to bring the series out in pamphlet form. We printed 10,000 copies and worked out the best mailing list we could—ministers, educators, doctors, every legislator and candidate and every welfare organization in the state. Requests were so numerous that we had to print another 5000.

The arousement of the people was a sudden and wonderful thing. But now that they were aroused, how channel their crusading zeal? Checking around, I found Oklahoma was one of the few states in the country which had never had a mental-hygiene society. Also, we were cut off, deep in the heart of the Southwest, from the activities of national organizations in the field. All the big social-welfare outfits seemed to concentrate their energies in the East.

The development that brought action was a letter from a reader in El Reno announcing that he had started a Mike Gorman Fund for the mental hospitals. He enclosed $11. In the next five days I got 23 more letters and the fund totaled $115.

I had heard there was a small group of people in Tulsa who had formed a committee to keep mental patients out of jail during the period preceding their commitment. On November 21, 1946, I flew over and met with them. They agreed a state society was needed. Since the legislature was convening in a month, we called a mass meeting for December 3, in Oklahoma City's municipal auditorium.

That day the auditorium was packed with ministers, oilmen, lawyers, farmers, social workers—and people. Then and there the Oklahoma Committee for Mental Hygiene was born.

Since we had no time, nor the money, for a professional fund-raising campaign, we depended on the papers to print an appeal for funds to finance our legislative fight. In one of the most generous and moving demonstrations I have ever witnessed, $7000 poured in within two weeks from 2913 individual contributors. The largest contribution was $100 from the First Baptist Church of Okmulgee. Practically all of the contributions were accompanied by a long letter—many of them scrawled in pencil and full of misspelled words—pledging heartfelt support.

We were in business.

The Senate Investigates

THE FUR began to fly on December 7 when a special state senate investigating committee went down to the hospital at Norman. I celebrated my 32nd birthday by going down with them.

Now, none of these men had ever investigated a mental hospital before. They were oilmen, ranchers, farmers, newspaper publishers, and so on. They knew much more about Bang's disease in cattle than about mental disease in humans. The assistant superintendent, knowing their deep interest in farms, spent two precious hours in showing them the hospital farm and dairy. About 11:30 a.m. I testily suggested there were some human beings in the hospital, too. I asked the assistant superintendent to take them into the "cafeteria," the low-ceilinged, foul-smelling hall where the attendants threw the food at 500 chronic women patients at a time.

Two of the senators couldn't take it; they rushed out. The others stood, looking as though they were riveted to the floor. When the group came out the assistant superintendent suggested lunch. There was a deadly, green silence.

As we approached the wards the assistant superintendent stopped every now and then to say hello to a patient. He greeted a number of them as "Doctor." This puzzled one of the senators, who asked the assistant superintendent why he was humoring the patients this way.

"But they are doctors," he replied quietly. "We have a number of doctors here, most of them in their 50's and 60's, who broke down from overwork during the war."

The senator who had asked the question looked down at his feet. His fellow senators looked very thoughtful.

Apparently they were beginning to realize that all strata of society were represented in mental institutions. And they were soon disabused of the idea, which they probably held when they started the tour, that mental patients spent their entire time throwing rocks or golf balls at each other.

The senators were about ready to leave the secluded block when the last cell was opened. The confined woman, gray-haired and dignified in appearance despite her disheveled clothing, came over the threshold and looked pensively at the group. She finally fixed her gaze on one of the senators. He became increasingly uncomfortable and started to leave. All of a sudden she blurted out: "Senator . . .!"

The senator jumped as if he'd been shot. The other senators looked aghast at the thought that these people had a memory.

She was a highly excitable, manic patient. She rushed to the senator and pumped his reluctant hand. She told him how many times she had voted for him. She talked of her brother who was a doctor, of another brother who was a lawyer. She asked the senator how they were. They were all right, he guessed. He took out a handkerchief, painfully mopped his brow and was visibly shaken as we continued our tour.

We went into the ward building for war veterans. One of the patients, dressed in a natty blue suit, had a copy of *Time* in one pocket and a copy of *The Daily Oklahoman* in the other. Again the unbelieving looks. "You mean these patients can read?" they seemed to say.

One of the senators suddenly pulled me aside and asked if the man in the blue suit wasn't So-and-So, "one of the finest newspaper reporters in the state in his prime."

I said it was, and took the senator over and introduced him to the reporter. They launched into a 20-minute political conversation while the other senators stood and gaped.

That group of legislators had a few new ideas when they went home that night.

The legislature hadn't convened a week when the skillet began to broil. The Oklahoma Committee for Mental Hygiene, seeking guidance in its legislative fight, brought Justin G. Reese,

chief field worker of the National Committee for Mental Hygiene, down for a week's speaking tour. A fighter blessed with a fiery eloquence, he charged in his first speech that dogs in Oklahoma were receiving better care than the patients in its mental institutions.

This irritated the conservative senators, and Louis Ritzhaupt, the only doctor in the senate, thundered: "I think it is time we, as members of the senate, served notice that our Oklahoma institutions are as good as will be found anywhere in the world. An untrue picture of these institutions has been painted in the newspapers."

Governor Roy Turner, who had just taken office, got a quick baptism of fire. In his inaugural message to the legislature he had spoken about the legislators not being magicians in setting up a mental-reform program.

Reese came right back. "The Governor is a little mixed up," he said. "It's not magic that's needed—it's money. For years Oklahoma has treated the state institutions as though they were places of magic, able by some sleight of hand to take care of 10,000 mental patients with funds which wouldn't care decently for 1000."

For a week charges and countercharges flew thick and fast. Then the legislature started nightly hearings on the budgets for the mental hospitals. These sessions, closed to the public in other years, with the state hospital superintendents meekly presenting their estimates and hoping for a legislative crumb, were now jam-packed with interested citizens.

I Go to Colorado

MEANWHILE, Carl Stuart, managing editor of *The Daily Oklahoman,* was carefully planning the paper's strategy during the legislative session. He wanted to run a series on what some other state was doing in the way of decent care for the mentally ill. I showed him a list which rated New York, New Jersey, Connecticut and Illinois at the top.

He looked it over thoughtfully.

"No, Mike, that won't do," he said. "We've got to find a state which is not only comparable to ours in population and finances but which is known to Oklahomans. I don't want to face the old boomerang about the East having several centuries and accumulated wealth in their favor."

We combed a little further, and hit upon Colorado.

There was a great lesson for Oklahoma in the work of Dr. Franklin Ebaugh, director of the Colorado Psychopathic Hospital at Denver. Dr. Ebaugh had been a pioneer in smashing down the artificial distinctions between the physical and mental illnesses. He had a full-time psychiatrist working in practically every major department of Colorado General Hospital.

I started off my series on Ebaugh's work with a quote from one of his writings stating that mental disorders would soon be treated on the same basis as physical disorders. "We are approaching the time," he wrote, "when general hospitals with their splendid delivery rooms, solaria for the tuberculous and modern facilities of all types will also have provisions for the adequate care and treatment of mental patients."

I pulled a fast one here. I pointed out, at the end of the article, that this statement had been written in June 1925! Oklahomans who were fighting introduction of psychiatric units into general hospitals blushed furiously.

After finishing up with Ebaugh, I journeyed down to Pueblo to study the big Colorado state institution which housed 5000 patients.

Dr. Felix Zimmerman, when he became head of Colorado State Hospital in 1928, fell heir to an institution even worse than any of the Oklahoma mental hospitals. But he had one tremendous asset: he wasn't afraid of the state legislature. In 1929 the Colorado legislature did what it had always done with the mental budget—chopped it to pieces. Zimmerman rushed to Denver and amazed the legislators by throwing the keys to the hospital in their stupefied faces.

"I was kind of afraid they'd take me up on it, but I really meant it," Zimmerman told me, smiling as he recalled the incident. "I told them I was a psychiatrist, and my job was to take care of those sick people. If they didn't give me the money to do the proper job, they could have the keys and run the place themselves."

The legislature backed down and restored the slashes. Since then Zimmerman has waved the keys in front of the legislature many times, but they've never called him on it.

He was a new breed of hospital superintendent. He did things which shocked the old-liners. Feeling the hospital was cut off from the community, he got the state to provide liberal sums so the employes could buy homes in Pueblo. He encouraged his doctors to join the various civic clubs, take an active part in the community. Instead of hiding his institution behind walls of isolation, he encouraged the public to come out and visit his place. Every Sunday was open house.

These facts were presented in our series of articles on Colorado. It sustained public interest in the legislative hearings on the mental bills. We got another flood of letters asking us to reprint this one as a pamphlet, too. Under the title "Let There Be Light," we printed 10,000 copies, and soon were out of them. We attached three powerful editorials to the pamphlet, the sum of which was an aggressive call upon the legislature to "blueprint a realistic attack upon the state's No. 1 health problem—mental illness."

Fuel for the Flames

DURING March, 1947, the campaign lagged. A 46-page mental-health bill, repealing Oklahoma's outmoded 1917 Lunacy Law, had been drawn up in December, 1946. It established enlightened commitment procedures, removed the state mental institutions from politics by setting up a medically controlled mental-health board, provided for appointment of a psychiatric director of the state's seven mental hospitals and opened the way for a broad clinical and preventive program.

The bill ran into all sorts of obstacles. It was so long and so full of psychiatric terminology that many legislators were actually afraid of it. It was bounced from committee to committee. We were trying to push hearings on it, but were getting nowhere fast. Just when things looked darkest, however, two sensational developments occurred.

I was pacing the floor at home one Sunday evening when the phone rang. It was an anonymous tip reporting the severe beating of an elderly patient—whose name the informant gave me—at the Central State Hospital in Norman.

Officials were thunderstruck when I walked into the main building at Central State at 8 p.m. that day. After recovering from their initial shock, they pieced out a fantasy about the old man, who was 89, being a violent patient who had to be continually restrained. I asked to talk to the attendants who had beaten the old man.

Then it all came out. They admitted

the beating had been administered by two patients who were working as attendants in the ward. Officials said it would do no good to talk to the patient-attendants. I said I wasn't going to leave the hospital until I talked to them.

The elder of the two was a paranoid praecox, a patient suffering from a disordered personality with dangerous delusions. Yet he had been in charge of a ward at night for the past 18 months! He told me he had tried to choke the 89-year-old man because he was making a noise. The other attendant, a powerfully built low-grade moron who came from one of the finest families in Oklahoma, admitted having struck the old man a number of times. I checked and found there were 60 patients acting in similar capacities as ward attendants at the Norman hospital.

Next day we took some pictures of the old man, and I tried to write the story. I felt like a fool, sitting there in the middle of the city room, the tears pouring down my face as I angrily thrashed my typewriter. I was sorry for the old man, sorrier for the poor patient-attendants who knew not what they did, and sorriest of all for all of us who had let horrible things like this come to pass.

Our 200,000 readers got a powerful shock when they picked up their papers the next morning. Splashed across the center of page one, two columns wide and six inches deep, was a gruesome close-up of the old man's beaten face.

We had just started getting a flood of reactions on this story when I received a call from the state commissioner of charities and corrections. He told me he was leaving for Fort Supply hospital to investigate the death of a mental patient there. He said reports indicated the patient had been beaten to death by a group of attendants.

The next few days were slightly hysterical. Little could be done in prosecution of the Norman case, since the patient-attendants could not be held legally responsible. But the Oklahoma Committee for Mental Hygiene issued a smashing statement demanding full prosecution for the attendants in the Fort Supply beating.

In the meantime the patient had been buried. I called the superintendent. Had there been an autopsy before burial? He said there hadn't. Why not? Well, he hadn't thought it was necessary.

I called the chairman of the board of affairs, who had charge of the mental institutions. How about an autopsy? He said no money was provided for such a contingency. I suggested, politely, that it might be wise to find some money for one.

The pathologist's report was somewhat of a surprise. Although the patient had a tremendous three-inch bruise on his stomach and countless bruises all over his body, the report said "the patient died of self-inflicted violence."

That "self-inflicted violence" phrase didn't sit well. The state, pushed by the chairman of the board of affairs and the state commissioner of charities and corrections—both determined to get to the bottom of the mess—requested a coroner's inquest. It was held a few days later. Despite the "self-inflicted violence" report of the pathologist, the jury declared unequivocally that "the patient had died of violent means at the hands of an instrument or instruments unknown."

PUBLIC FUROR over the beatings hit the legislature with terrific impact. On the day both beatings were splashed across the front page of *The Daily Oklahoman,* most of the legislators rose in righteous wrath to denounce the foul blot upon Oklahoma's fair name.

Representative John T. Levergood proposed an amendment to the mental-health act making it a felony instead of a misdemeanor for an attendant to abuse a patient in a mental institution. It set a penalty of a five-year prison term, a $500 fine, or both, for an attendant guilty of such a felony. It made any superintendent or psychiatrist who aided or abetted such practice equally liable to prosecution. Very strong medicine, but the legislature was up in arms, and the amendment was later incorporated in the mental-health act.

The amendment precipitated a fierce debate. Senator Louis Ritzhaupt, the doctor who a few months before had declared Oklahoma's mental institutions among the finest in the world, got up in the senate and minimized the whole thing. He said beatings like those at Fort Supply and Norman were common in every mental institution.

The roof fell in on Senator Ritzhaupt. Dr. Hugh Galbraith said in a public statement: "These beatings have occurred, and will continue to occur as long as the indefensible practice of using mentally sick patients as attendants is continued."

Joseph K. Peaslee, newly chosen executive secretary of the Oklahoma Committee for Mental Hygiene, joined the offensive.

The attack on Ritzhaupt seemed to galvanize the legislature. Hearings were finally scheduled on the mental-health act, and we all breathed a sigh of relief.

OUR RELIEF was short-lived. The hearings bogged down in complex discussions of proper psychiatric treatment and the splitting of legal hairs over the involved commitment sections of the mental-health act. Then on April 8 the senate appropriations committee whacked $173,000 off the salary budget at Central State, thus cutting the heart out of our reform movement at the state's biggest mental hospital.

We had to get some public pressure, and quick. The State Federation of Women's Clubs was holding its convention in Oklahoma City at the time, but I didn't connect it up with the idea of a protest until my wife suggested she go see her mother, who was a district president and one of the big powers at the conventions. Her mother explained that the women were ready to go home. My wife poured it on. My mother-in-law quick to see the light, went into action.

She rounded up the members of the executive board, and they promptly passed a hot resolution demanding that the cuts be restored. They sent wires to the Governor and every key legislator. The most powerful women's organization in the state, with 7000 members, their word was mighty. The budget cutters began to weaken.

W. Russell Borgman, chairman of the state board of affairs, informed the legislature that several doctors at Norman would quit if the cuts went through. Between Borgman and the women the job was done. The cuts were restored.

While the legislature was backing and filling, the good people of Oklahoma had been pushing the fight on other fronts.

From the first the ministers had taken up the cause. Firmly convinced of the need for close cooperation between religion and psychiatry, they called from the pulpits for their brethren to enlist in the fight. And the good people did act.

But the legislative session was drawing to a close, and we still didn't have our mental-health bill. Every time the senate leaders would agree to bring it up, a tornado or something equally devastating would occur. Finally, during

the last week in April, Senator Perry Porter, floor leader and a supporter of the bill, said he'd bring it up on Tuesday morning.

When the bill at last reached the floor, Senator Ritzhaupt immediately leaped to his feet. A powerful speaker, he began to tear the bill to pieces. Dosing his speech liberally with "neuropsychiatric," "psychopathic," "stuporous schizoid," and so on, he soon had his fellow senators on the ropes.

Several senators got up to defend the bill, but their unfamiliarity with its psychiatric provisions doomed their efforts. At intervals Ritzhaupt introduced crippling amendments.

I was just thinking of how I was going to leave Oklahoma — by train or plane—when the senate president recognized Senator Fred Chapman, a burly plain-spoken millionaire from the rich farmlands of southern Oklahoma, who may be short on formal education but is long on honesty.

Chapman started to answer Ritzhaupt. He sounded all right until he hit the word "psychiatric." He bucked it, he tried to rope it, but he couldn't get over it. Finally he tossed it aside.

"Mebbe I can't pronounce the danged word," he bellowed, "but I know in my heart this is a good bill. I have seen conditions in these hospitals. My constituents want this bill, the people, the people of this state want it, and everyone tells me it'll help the poor sick people in these institutions. Let's cut out fiddling around and pass it!"

Chapman's speech was the clincher. One after another of Senator Ritzhaupt's amendments was beaten down. He finally got up on the floor and withdrew the rest of them. On roll call he voted for the bill himself. He had been licked "fur and squir," and from that day on he was an active supporter of a sound mental-hygiene program.

We Get into Hot Water—and Out

WHILE we were concentrating on the mental-health act, we had pretty much neglected building appropriations for the hospitals. However, we were confident the legislature wouldn't cut the funds proposed.

We were wrong. On a Friday, five days before the close of the session, a million dollars was whacked from the appropriation for new buildings. In defense of the cut the axe-wielders argued that not a single dollar was being appropriated for buildings at any of the many other state institutions, that we were getting plenty as is. How could we get back at them? Everyone told me it too late to do anything.

I put a piece of copy paper in my typewriter and beat out an editorial. I threw the facts and figures out the window, wrote something that I wanted to get under the hides of the legislators.

Here's the brief editorial, headed "Two More Years of Misery":

> The legislature is in a hurry to get home.
>
> Speeding along toward adjournment, the house-senate conference committee has slashed a million dollars from the appropriations for new buildings at seven mental hospitals.
>
> It is probably unkind to remind the 21st legislature that the joint house-senate appropriations committee, back in February, agreed that the total building appropriation of three millions was the minimum needed to relieve the barbaric over-crowding at all state mental institutions.
>
> In a few days the members of the 21st legislature will hurry happily down the statehouse steps and head in the direction of the warm May sun. But 10,000 mental patients in this state cannot head for home, nor can they bask in the rays of a benevolent sun. Crammed together in dilapidated buildings, they will continue to live out their days in filth and misery.
>
> Nor will these mentally sick people be able to protest this slash. They have no lobby. They cannot threaten the 21st legislature with retribution at the polls.
>
> But if these unfortunates had a voice, could they describe the heart-break that will be visited upon them for the next two years because of this million-dollar cut? Could they tell the legislators of the miseries of living in shadowland endless day upon endless day, and of the hope they had had that at last a sympathetic legislature would hear their cries for help?
>
> Even if they had the voice, they couldn't be heard. Their words would be too tired and weary. They have seen legislatures come and go, with their solemn pledges in February and their ruthless slashings in May. They would chide themselves for the naive hope that the 21st legislature would have been different.

The legislature whipped up a collective froth in less than an hour after the paper hit the streets. Members vied with one another in denouncing the paper. To cap the climax, a satirical resolution was introduced in the house by Representatives D. A. Segrest and George Campbell. In their wrath they hit out at not only *The Daily Oklahoman* but also the Tulsa *World* and the Tulsa *Tribune*. The resolution suggested that since these "alleged newspapers," which had hitherto advocated that the legislature "keep appropriations within the constitutional limits," had now "seen fit to boost their circulation by a series of unreliable and inaccurate sob stories . . . a tax of one-half cent on each and every paper published by said newspapers be levied for the express purpose of providing adequate buildings for the mental hospitals in the state of Oklahoma."

This indignant resolution precipitated a fiery debate until, amid hysterical hubbub, Speaker Raymond Board roared that the measure would have to be assigned to a committee. Representative Joe Harshbarger moved that it be sent to the committee on deep-sea navigation. Oklahoma, dry in more ways than one, hasn't enough water to justify a deep-creek committee. The resolution was accordingly sent to the fictitious committee.

Next day, when tempers had cooled a bit, much of the cut was restored. We were afraid, however, that legislative resentment over the editorial might defeat the mental-health bill in the house.

From 10 p.m. until midnight supporters of the bill scurried around getting the conferees to put their names on a compromise report which had been hastily drawn up. The newly elected president of the Oklahoma Committee for Mental Hygiene, Mrs. Thomas W. Leach, wife of a wealthy Tulsa oilman, stationed herself near the legislators' rest room. "The legislature had been in session for 14 hours, so I figured that was a good place to be," she said.

A little after midnight enough signatures had been obtained to push the report over the top.

Next day, the last day of the session, the mental-health bill was passed.

We Had Come a Long Way

WE HAD COME a long way in a few short months. While many Oklahomans were still stumbling over such words as "psychosis" and "schizophrenia," Oklahoma had advanced a generation in its approach to the problem of mental health.

Appropriations for mental hospitals were more than double those voted by any previous legislature. In addition to three and a half million dollars for new

buildings, an increase of more than one million was provided for additional personnel and considerably upped salaries. Provision for a minimum addition of 19 doctors, 21 nurses, 300 attendants, 12 occupational and recreational therapists and five social workers was incorporated in the various bills.

The model mental-health act was the greatest achievement of all. It set up voluntary admission of mental patients with the classification "mentally ill" instead of "insane." Counties were enjoined, under penalty of law, from putting patients in jail before commitment to hospitals.

Under the new act a voluntarily admitted mental patient could not be held in hospital more than 60 days unless the superintendent himself filed a written appeal for an additional stay. This appeal would be reviewed by a board of medical examiners. The bill surrounds the patient with legal and medical safeguards, including the right to review of his case at his own request or that of any member of his family, right to apply for writ of habeas corpus and protection against attendant and employe abuse.

The mental institutions were taken out of politics and placed under a mental-health board composed of the dean of the University of Oklahoma medical school, the state commissioner of health, the chairman of the board of affairs, a psychiatrist and a general medical man appointed from the public by the Governor.

Under the board was established the post of medical director of the mental institutions, qualifications for which were most rigid. The medical director was given complete control of the administration of the hospitals and the power to investigate and remedy—by subpoena if necessary—any abuses in the care of the mentally ill patients.

Provision for setting up mental-health clinics, under the joint control of the state department of health and the medical director, signalized a new day in the early treatment and prevention of mental illness.

Meanwhile *The Daily Oklahoman* had been through one of the most punishing campaigns in journalistic history. In the short space of nine months we had carried more than 200 major news stories and 60 editorials and editorial columns on every conceivable facet of mental illness. We had run the gamut from sentiment to fact to pointing the finger. I had written a long series of editorial columns against mechanical restraint of patients, quoting reams of statistics culled from practically every state in the country. I had followed it with a long survey of clinical and preventive work in other states.

But the response had been worth all the sweat and blood. The legislature, at first disinterested and then somewhat hostile, had overcome its prejudices and risen to great heights as it enacted one of the finest sets of mental-health laws any state can boast. Governor Turner had been a pillar of strength behind the mental-hygiene reform program during the last month of the session, and has continued since then to be a strong advocate of every reform proposal. Best of all, the good solid people of the earth had swarmed to our support—from the wheat fields, the oil wells, the alfalfa patches. They had trudged to the capitol and given their representatives some of the dangdest plain talk they'd ever bent an ear to. They had sat down, after a backbreaking 12 hours in the fields, and penciled messages demanding that Christian justice be meted out to their 10,000 brethren confined in the mental hospitals.

ANYBODY knows that a good mental-health bill doesn't necessarily make good mental health. After the uproarious campaign of getting the bill passed, Oklahomans could have sat back and pointed to the statute books with self-satisfaction. They didn't. A series of rapid-fire actions have served to buttress the bill.

First, the Oklahoma Committee for Mental Hygiene, which had spent every last cent in its treasury, raised over $35,000 for intensive educational and promotional work. The campaign was put over almost singlehandedly by its dynamic new president, The Rev. Bill Alexander, who also spearheaded the fight to secure an out-of-state man as medical director of the state's mental hospitals.

During the summer 31 students at the University of Oklahoma banded together and petitioned the biggest mental hospital to let them work there. They came from practically every department in the school—not just a flock of psychology majors. They were the cleanest, nicest, most sincere kids I've ever met. They had read all the stuff about the mental hospitals and they wanted to pitch in and help. The work was appallingly tough—most of them were given jobs as ward attendants—and the hospital in summer was a steaming cauldron. But they stuck it out, pioneers blazing a new trail in a pioneer state.

Up to now we had done little on our most important front: attacking mental illness in its early stages. But under citizen pressure for intensive early treatment the first clinical psychologist ever employed in a state mental hospital was assigned to the Central State staff. And on November 1, 1947, with the help of the Oklahoma City chapter of the American Business Club, we opened the first mental-hygiene clinic in the state of Oklahoma.

Dr. Bill Lemmon of the University of Oklahoma had his heart set on a mobile psychological unit. He wanted to take his graduate students to the state institutions and the schools and turn them loose on testing and interviewing. The Oklahoma Committee for Mental Hygiene bought him a station wagon.

The next day Bill bundled the unit in it and tore out for Enid. He's never stopped since. The first week he went up to the institution for mental defectives, he uncovered three patients perfectly capable of leading normal lives. The superintendent, who has given him 100 percent cooperation, got one of them a job and placed the other two, who were still of school age, in the public school. It's been something like that every week since. The Oklahoma City schools are so sold on Lemmon they've set up one of the most comprehensive personality-guidance programs in the country. One of Lemmon's graduates is now a full-time psychological counselor for the schools.

I HAVE HEARD a great deal in my time about government by the people, but this is the first time I ever saw it actually happen. The Oklahoma experience proves to me that, in spite of stubborn opposition from politicians and the obstruction of indifference in high places, the people *can* govern themselves if they really want to. When *The Daily Oklahoman* blew its first blast in this fight, any shrewd gambler would have given odds that nothing would happen. Everything did happen. You can't understand American democracy or calculate the future of this land unless you reckon with the holy power of an aroused public.

•

THE NATIONAL MENTAL HEALTH FOUNDATION

urges every citizen to join in its attack on

"AMERICA'S No. 1 HEALTH PROBLEM"

MENTAL ILLNESS

OUR OBJECTIVES

To achieve public recognition that mental illness is not a disgrace, that it may afflict anyone and that in many cases it is curable.

To remedy the shocking conditions in our public mental institutions and insist that the highest attainable standards of treatment and care be provided for the mentally ill.

To further the development of preventive mental hygiene facilities.

AMONG OUR ACTIVITIES

The Foundation has, during the past two years, been responsible for the publication of reports on conditions in state mental hospitals, which have received nationwide press and magazine publicity and have led to widespread popular demand for reform.

The Foundation has organized citizens groups throughout the country which are working for improvement in the treatment of the mentally ill.

The Foundation has produced two mental health radio series which have been heard on a total of 325 stations as a means of public education; has published book and pamphlet literature to help the average citizen understand mental health problems in his home and community.

Re: The New British National Health Service

Great Britain's newly operating National Health Service is of such widespread interest that we think you may want accurate information to correct some distortions which have been widely circulated in the press.

This report covers:

1) Background information on the Act
2) Statements and misstatements
3) What British doctors, laymen, and officials say

If you desire more copies, I shall be happy to send them to you or to people you may suggest.

I THE STORY OF BRITISH NATIONAL HEALTH SERVICE

First Started in 1912

Great Britain launched its National Health Service July 5, 1948. This act extends complete medical service to all British people far beyond the limited benefits provided by the National Health Insurance Act of 1912.

This early act was first opposed by the British Medical Association (BMA). Later, it was so enthusiastically received that in 1928 the BMA recommended expanding it to provide broader service to more people. The BMA's own Medical Planning Commission blueprinted a comprehensive plan in 1942.

Sponsored by Winston Churchill

In 1944, Prime Minister Churchill proposed:

> "....a national health service in order to ensure that everybody in the country, irrespective of means, age, sex or occupation, shall have equal opportunities to benefit from the best and most up-to-date medical and allied services available....We welcome constructive criticism; we claim the loyal and active aid of the whole medical profession."

The BMA approved the Act after compromises, acceptable to both sides. But the basic principle of compulsory national health insurance itself was never disputed.

Declared the BMA in April, 1948:

> "The Doctors Want A Comprehensive Service. Doctors are not against a National Health Service. They approve of the bulk of the present Act. Doctors have been fighting for years to get their patients better medical service."

Cost of Service

In 1946, officials estimated the Act's cost at £ 152,000,000 ($608,000,000). Rising costs of hospital operation, drugs, doctors' fees, etc. have upped this estimate to £ 218,000,000 ($872,000,000). This still averages less than $20 per Britisher annually. (Compare this with the extravagant figures quoted in the U.S. on British costs.)

II STATEMENTS AND MISSTATEMENTS

Dr. Fishbein's "Research"

"The greatest folly in the world" is what Dr. Morris Fishbein, editor of the Journal of the American Medical Association, called the British Act in September 1948. "An even greater folly would be the attempt to offer a similar service in the United States."

(more)

The "research" behind this conclusion is related in his diary, published in the JAMA. It reveals that he spent less than seven days in Great Britain -- was most impressed with wining and dining, the Olympics, and celebrities. Here are a few entries:

First day: Spent several hours with bigwig physicians. "There was much talk of the new health Act and what's wrong with it and right with it." Second day: Dinner at the Athenaeum Club with the King's Physician and the Chief of the Ministry of Health. Talk, "somewhat of the National Health Act ....flowed merrily on through half the night...."

The Olympic games, the theater, and sightseeing took the next two days. On the fifth, Dr. Fishbein observed general practitioners "at their tasks with the National Health Act." Finally, before enplaning to Paris, he talked to Ministry of Health officials and collected "the forms and the regulations which are the heart, soul, and digestive tract of a national health insurance system."

Biased and superficial appraisals like Dr. Fishbein's have previously provoked the BMA and the Ministry of Health to publish rebuttals. In 1939, a hostile article in the Chicago Tribune evoked this flat contradiction from the BMA Secretary:

> ".....The medical profession regards national health insurance as a social development which has improved immeasurably the health of the people covered by it, at the same time raising the standard of medical practice....."

Just two years ago, a pamphlet of the N.Y. State Medical Society declared:

> "The British people are aware that compulsory sickness insurance is providing them with second-rate care. In 1936, 600,000 workers failed to register for the services of insurance physicians, even though they had paid their sickness insurance taxes."

The 600,000 figure constituted less than 4 per cent of those eligible to register. It largely represented Christian Scientists; cultists; and just plain careless people. Ministry of Health figures for 1936 show that 96 per cent were registered under the first act.

As for the new act, the AMA's own British correspondent reported in September, 1948: "Between 92 and 93 per cent of the population have registered." They expect 95 per cent.

III WHAT BRITISH DOCTORS LAYMEN & OFFICIALS SAY

The King's Physician

Lord Moran (Dr. Fishbein's wining and dining companion) said:

"It was the war which, by rubbing the nation's nose in the facts, prepared it for reform and educated many in the medical profession to accept change."

Dr. H. Guy Dain, Chairman of the Council of the British Medical Association, declared at an Association dinner on July 1, 1948, four days before the new Service actually began, that "... doctors would put their best efforts into making it a really fit and proper and good Service for the people of this country."

The BMA has issued a pamphlet for practicing physicians to explain the act to their patients. While the U.S. press often plays up isolated refusals by British MD's to cooperate, these extracts show the cooperative spirit of the profession as a whole:

"July 5,1948, was a notable occasion in our history. On that day the National Health Service started -- the foundation of a comprehensive service for the entire community. The medical profession pledged itself at the start to do everything it could to make the Service a success. But -- and there is a very big 'but' .... The Service cannot be a success unless the three parties concerned help to make it so: Doctors, nurses, and the other workers in the Service; the Government and the administrators; the public .. All have a part to play. Each should try to appreciate the others' difficulties.

"How Everyone Can Help. It is fair to the public that they should be told the truth about these and other deficiencies. The doctors will work their hardest to have them removed. So will everybody else. But it will all take time. Do not expect too much too quickly.

"Meanwhile, there are ways in which everyone can help his or her doctor to get around his work:

"Please ask the doctor to call only if you can't get to his surgery and you really need him. Wherever possible, if you want the doctor to visit you, ask him before he starts his rounds. This helps him to plan his day, avoids needless journeys, and makes the best use of his time."

(more)

A month later, the LANCET, long-established, independent British medical publication, said:

> "Most practitioners would agree, we believe, that the month (the first month of the National Health Service) has brought fewer changes than they feared. It is true that, for many of them, surgeries have been unusually heavy; but some of the extra work will not have to be repeated. Patients . . . have come to ask questions, or hand in forms. Others have waited for July 5th before presenting themselves to have their eyes tested or their minor operations arranged."

By October, the new Health Service had been operating three months. Said THE SPECTATOR, British conservative weekly:

> "In general the new machinery seems to be running smoothly for both doctors and patients.....the chaos of the week or two before and after July 5th, when most patients and some doctors were uncertain exactly what they ought to be doing, sorted itself out more quickly than might have been expected, thanks very largely to the devoted work of the staffs of the local Executive Councils.....The National Health Service obviously can be worked.....Defects will become obvious as time goes on, but with the willing cooperation of the profession and lay bodies concerned and wise and helpful guidance from the centre, these can be remedied and the service made one of which the Nation may justly be proud."

British Labor's Point of View

The General Secretary of the British Transport and General Workers Union, replied to Dr. Fishbein's attack on the British Health Service:

> "..... The shortages of doctors, hospitals and nurses referred to by the Journal exist, and will have to be made good. At the same time, we believe that the skill and efficiency of our doctors and other health workers are not below the standard of any other country. Indeed, we are justifiably proud of the achievements of British medicine in many fields. The object of the National Health Service is to make that skill available on a wider basis to the whole community."

The British Ministry of Health (official statement):

> ".....The Service has so far operated with remarkable smoothness. It was fully expected that July 5, would be the signal for an avalanche of complaints. Actually the volume of complaint and criticism has been small.

(more)

"It was always made clear that the mere inauguration of the new Service would not usher in a medical Utopia. But the Service will enable the nation gradually to make the best possible use of existing resources, and as conditions permit, to expand their scope and build new hospitals and health centers.

"The real test of the efficiency and resiliency of the new Service will come with the winter. There are certainly no signs that the Service is creaking. Doctors, dentists, chemists and opticians may certainly all be busy. Part of this may be due to the back-log caused by people waiting until the Service opened on July 5th. But there is no evidence that they are being submerged and at breaking point. Independent observers certainly do not reach such a conclusion."

The Committee for the Nation's Health plans to issue further interim reports to keep you informed about the British National Health Service.

If you wish data on some particular aspect of the Act or want to check information on it reported in the press, just communicate with our Washington or New York office.

Washington, December 1, 1948 - 80th Congress - Issue No. 96

PRESIDENT TRUMAN'S SOCIAL LEGISLATION PROGRAM and the 1948 DEMOCRATIC PLATFORM

President Truman has indicated his intention to press the 81st Congress for early approval of his legislative program as outlined in his recommendations to the 80th Congress, and the 1948 Democratic Platform. The first official disclosures of which specific bills he will ask Congress to enact during 1949 and his preferences as to priorities may not be expected until he sends his three major messages to Congress in January. They are the Budget, the State-of-the-Union, and the Economic Messages. He may also subsequently send special messages on special problems such as housing, social security, and so forth.

Preliminary Activities: In the meantime, the President is carrying on a series of consultations with the heads of federal agencies, the Democratic leadership of Congress and his political and government advisors in his efforts to formulate his program for the 81st Congress. The following factors are of special note:

1. The head of each federal agency has submitted to the President a list of legislative proposals recommended for inclusion in the President's program. These proposals, however, do not become an official part of the agencies' programs until after they are approved by the Bureau of the Budget as being in conformity with the President's program. In view of the substantial Democratic majorities in both branches of Congress, a bill which is not supported by the federal agency having jurisdiction will have small chances of receiving early and serious consideration by Congress.

2. The scope and size of existing programs will depend upon the funds which are appropriated by Congress. For the most part, the recommendations of federal agencies for appropriations for the next fiscal year commencing July 1, 1949 have already been submitted. In his Budget Message to Congress in January, the President will submit not only his recommendations for continuing, and decreasing or expanding existing activities, but also his estimates for initiating new ones pursuant to his immediate legislative program.

3. Before the 81st Congress convenes, decisions will have been made by the Democratic leadership as to the chairmanships of congressional committees and the

IMPORTANT: File each issue for future reference since the Bulletin will frequently refer back to information reported in previous issues. Buy a ring binder at any stationer and insert each issue.

HOW TO SECURE COPIES OF BILLS: Write for single copies to the Superintendent of the Document Room, U. S. Senate or House of Representatives, Washington 25, D. C., depending upon whether you want a Senate or House Bill.

subcommittees which will have jurisdiction over specific subjects such as health, education, and so forth. Assignments will also be made in regard to the membership of these committees and subcommittees. These decisions are of the greatest importance to the ultimate fate of proposed legislation because most of the important work of Congress is done in committees rather than on the floor of Congress. The chairman of each committee wields great power in deciding which bills are to be considered and acted upon, and in what order of priority. The membership of the House Rules Committee is of special importance because of its power to prevent bills from reaching the floor of the House for debate and action even after they have been reported favorably by the regular committees.

This issue of the bulletin reports on President Truman's principal recommendations for social legislation, the action taken by the 80th Congress on some of his proposals, and the provisions included in the 1948 Democratic Platform on these several subjects.

* * * * * *

DEPARTMENT OF HEALTH, EDUCATION, AND SECURITY

A bill (Senate bill 140) was reported favorably to the Senate to create a Cabinet Department to be known as the Department of Health, Education, and Security to discharge the functions now vested in the Federal Security Agency. The purpose of the bill is to provide for more effective administration of functions already being performed by federal agencies in the fields of health, education, social security, and related services contributing to individual, family, and community well-being.

The bill did not reach the floor of the Senate for debate and action largely because congressional leaders felt it desirable to postpone any major reorganizations until after the Hoover Commission had completed its comprehensive study and submitted plans for the general reorganization of federal agencies. No action was taken on this measure in the House.

In his message to Congress on this subject, President Truman presented this recommendation in general terms emphasizing that the "size and scope of the Federal Security Agency and the importance of its functions clearly call for departmental status and a permanent place in the President's Cabinet." In the light of the testimony submitted by the Federal Security Agency on Senate bill 140 it may be expected that the President will indicate his preference for a simple bill creating the new department, outlining its general mandate, and transferring to it the present functions, powers, and duties of the Federal Security Agency. It is not considered likely, however, that the President will send specific recommendations to Congress on this subject until after he has had an opportunity to consider the report of the Hoover Commission.

PUBLIC HEALTH SERVICES

The United States Public Health Service now administers a number of public health programs including special programs relating to venereal diseases, tuberculosis, communicable diseases, cancer, heart diseases, dental diseases, and the construction of hospitals and public health centers. The major part of its $160,000,000 appropriation is earmarked for grants-in-aid for various community disease control programs, medical research, and the training of needed health personnel.

President Truman has recommended that Congress expand the present program for public health and related services pointing out that "they have not yet reached a large proportion of our rural areas, and, in many cities, they are only partially developed." He asked that federal funds for these purposes be increased and distributed "in proportion to state and local expenditures and should also vary in accordance with the financial ability of the respective states." In his 10-year health program, the Federal Security Administrator recently recommended to the President that "the present system of federal grants-in-aid through state health departments be expanded promptly." The Democratic Platform does not contain any specific reference to this subject other than a general pledge for "the enactment of a national health program for expanded medical research, medical education, and hospitals and clinics."

The 80th Congress appropriated substantially all the funds requested by the Public Health Service for its existing public health programs and, in addition, passed several important health bills, namely, the National Heart Act, the National Dental Research Act, and the Water Pollution Control Act.

MATERNAL AND CHILD HEALTH SERVICES

The United States Children's Bureau now administers federal grants-in-aid programs dealing with maternal and child health services ($11,000,000 annually), and services for crippled children ($7,500,000). President Truman's proposed national health program calls for increased federal grants for these purposes to the end that no area "should be without community health services, such as maternal and child health care." He urged the adoption of a preventive health program to include "systematic and widespread health and physical education and examinations." The Democratic Platform states: "We will continue our efforts to expand maternal care, (and) improve the health of the nation's children." In this connection, the Federal Security Administrator recently recommended to the President that the fixed ceilings on federal appropriations for these programs be removed in order that present public programs might be extended to reach all children needing services.

NATIONAL HEALTH INSURANCE

During the past three years, President Truman repeatedly urged Congress to enact legislation for a national health program, and emphasized that the "heart of the program must be a national system of payment for medical care based on well-tried insurance principles." The National Health Insurance and Public Health Bill (S. 1320 and H.R. 3548) is designed to carry out the President's major health proposals in this regard. This bill would establish a national system of health insurance for prepaid medical care including all needed preventive, diagnostic, and curative services. It is estimated that it would cover approximately 85 percent of the population, and would be financed largely by social insurance premiums to be levied one-half on employed persons and one-half on their employers.

Proposals to establish a system of national health insurance have been the subject of extensive hearings by the Senate Committee on Labor and Public Welfare. At the conclusion of its hearings this year, the committee issued a report stating that its Subcommittee on Health was unable to arrive at any definite conclusions with respect to many of the basic issues involved in this and other proposed health legislation. Accordingly, it unanimously voted to continue its study with the view toward submitting a report and recommendations to the Senate during the early part of 1949.

In his last message to Congress (when he recalled it for a special session last summer) President Truman listed "a comprehensive health program, based on health insurance" as one of the measures which "the next Congress should take up immediately." It should also be noted that when the President sent his budget message to Congress last January, he had recommended that Congress appropriate $15,000,000 to launch this program. This fund was to be supplemented during the first year or two by a payroll tax of one-half of 1 percent of individual salaries up to $4,800 a year. Thereafter, the payroll tax would be increased to a higher level not specified by the President. More recently, Federal Security Administrator Ewing, in response to President Truman's request for recommendations for national health legislation recommended the enactment of a federal law setting up a system of national health insurance. In releasing this report on September 2, 1948, President Truman indicated his support of this recommendation. The Democratic Platform adopted in July, 1948 does not include any specific reference to health insurance other than a provision favoring "insurance against loss of earnings on account of illness."

MEDICAL EDUCATION

In his message to Congress outlining legislation for adoption of a national health program, President Truman listed the lack of a sufficient number of professional personnel - doctors, dentists, public health and hospital administrators, nurses, and others - as one of the basic problems. He called upon Congress to authorize the federal government to "undertake a broad program to strengthen professional education in medical and related fields. . . where necessary through federal grants-in-aid to public and nonprofit private institutions."

More recently, the Federal Security Administrator reported to the President that "the first health goal" is to increase the number of medical and health personnel. To this end, he recommended that federal aid (at least $40,000,000 a year at the outset) should be provided for these purposes, including salaries, equipment and construction:

1. To assist schools now operating to maintain adequate standards of training.
2. To permit expansion of schools now operating so that they can accept more students.
3. To help organize additional schools, and to help those now being organized to get into operation at the first possible moment.
4. To provide scholarships and fellowships for qualified students without regard to race, creed, or sex.

In releasing this report, the President indicated his general approval of this recommendation. The Democratic Platform calls for the enactment of a national health program providing for expanded medical education.

NATIONAL SCIENCE FOUNDATION

President Truman had requested Congress to enact legislation to establish a National Science Foundation with authority to support basic scientific research (including medical research), and to provide scholarships and grants for this purpose.

The 80th Congress passed a bill in 1947 for this general purpose, but the President vetoed it because of its administrative provisions. During the 1948 session, Senate bill 2385 was passed in the Senate in a form which more nearly conformed with the President's recommendations,

but the bill died when the 80th Congress adjourned. On the House side, a similar bill (H.R. 6007) was reported favorably to the House but was not reached for debate and action.

President Truman is expected to renew this recommendation to the 81st Congress in line with the pledge contained in the Democratic Platform for "the early establishment of a national science foundation under principles which will guarantee the most effective utilization of public and private research facilities."

FEDERAL AID FOR ELEMENTARY AND SECONDARY SCHOOLS

The 80th Congress had given serious consideration to a bill introduced with bipartisan sponsorship to provide federal grants-in-aid to the states for the support of elementary and secondary education. In brief, this bill (Senate bill 472) authorizes the annual appropriation of $300,000,000 for grants to the states for the general purpose of enabling them to provide a minimum annual expenditure of $50 per pupil. In order to help equalize educational opportunities as between the high-income and low-income states, the bill provided variable grants ranging from $5 per child in the wealthiest states to about $25 per child in the least wealthy states.

The bill passed the Senate by a vote of 58 to 22. In the House, it was reported favorably by the Education Subcommittee which studied the measure, but was not acted upon by the full House Committee on Education and Labor. The House Republican leadership indicated that because of the effect on the federal budget of increased expenditures for national defense and foreign aid purposes, action on this proposal had to be postponed.

The President had repeatedly urged Congress to enact Senate bill 472 and appropriate funds to launch this new federal-aid program. Toward the end of the 80th Congress he addressed a letter to Speaker Martin expressing his conviction that "the increases which have become necessary in other federal expenditures present no valid reason for delaying federal aid to education." When he called Congress back for a special session last summer he again included the enactment of Senate bill 472 on the list of bills which Congress "can and should act on" at the special session. The Democratic Platform declares: "We advocate federal aid for education administered by and under control of the states. We vigorously support the authorization . . . for the appropriation of $300,000,000 as a beginning of federal aid to the states to assist them in meeting the present educational needs."

SCHOOL LUNCH PROGRAM

Among the President's long-range recommendations to Congress is one calling for the expansion of the school lunch program "until we are sure that every American school child gets an adequate diet." He also asked for a study of "the possible need for food and nutrition programs to reach low-income families." This coincides with the pledge in the Democratic Platform for -

"adequate financing for the school-lunch program; the use of agricultural surpluses to improve the diet of low-income families in case of need."

The 80th Congress voted the $75,000,000 appropriation requested by President Truman for the current fiscal year. This is $6,000,000 less than the appropriation for the previous fiscal year.

OLD-AGE AND SURVIVORS INSURANCE

Extensive studies have been made of needed changes in the old-age and survivors insurance system by congressional committees and the Federal Security Agency, and there are many indications pointing to probable action by the 81st Congress. Last May, President Truman urged Congress to make a number of improvements in this program including the following:

1. To provide more adequate benefits under old-age and survivors insurance by -

   a. increasing benefits by at least 50 percent;
   b. reducing the eligibility age of women from 65 to 60 years;
   c. permitting persons receiving benefits to earn up to $40 a month (instead of $15) to supplement their benefits;
   d. raising the limit on earnings taxable under the law from $3,000 to $4,800; and
   e. moving forward from January 1, 1950, to January 1, 1949 the date for increasing the tax rate from 1 to 1½ percent.

2. To extend coverage for old-age and survivors insurance as rapidly as possible to approximately 20,000,000 persons now employed in jobs not covered by the law.

   Shortly before Congress adjourned last June, the House passed a bill (H.R. 6777) which provided for extension of coverage to approximately 3,500,000 additional persons (including employees of nonprofit organizations on a voluntary basis, and state and local governmental employees - not covered by other systems - on the basis of state compacts); increased the benefit payments to the first dependent child of a primary beneficiary, and increased allowable earnings of a beneficiary to $40 a month. The Senate Finance Committee tabled the bill because there was insufficient time to consider it particularly in the light of the detailed and comprehensive report of its Social Security Advisory Council. The Administration objected to the bill on the grounds of its inadequacy.

The President has recently expressed his intention to renew his recommendations to Congress for the improvement of the old-age and survivors insurance program in conformity with the pledge of the Democratic Platform which states:

> "We favor the extension of the social security program . . . to provide additional protection against the hazards of old age, disability, disease, or death. We believe that this program should include increases in old-age and survivors insurance benefits by at least 50 percent, and reduction of the eligibility age for women from 65 to 60 years; extension . . . to all workers not now covered. . ."

PUBLIC ASSISTANCE

The 81st Congress is due to take some action on the public assistance provisions of the Social Security Act. The 80th Congress had adopted amendments which will expire on June 30, 1950 which temporarily increased the federal share of the costs for old age assistance, aid to dependent children, and aid to the blind. When these temporary amendments were adopted, several congressmen expressed the thought that agreement might be reached on needed basic changes in the public assistance programs before the date when these temporary amendments are due to expire.

Legislation on this subject traditionally originates in the House Ways and Means Committee which has given considerable study to these programs during the past four years. In anticipation of action by the 81st Congress on revisions of the social security laws, the Senate Finance Committee set up the Advisory Council on Social Security which recently submitted a report outlining its recommendations for changes in the public assistance programs.

In a special message to Congress last May, President Truman recommended that the public assistance provisions of the Social Security Act be amended to -

1. Permit the federal government to match more fully the higher payments which many states find necessary to meet the needs of recipients.

2. Provide federal grants to help cover the cost of aid to persons not included in the present categories (old-age assistance, aid to the blind, and aid to dependent children.)

3. Provide federal grants to help cover the cost of essential welfare services which avert or reduce the need for assistance.

4. Relate federal grants more equitably to the financial resources and needs of each state.

The bill which is generally considered as carrying out the President's recommendations is the proposed "Public Welfare Act" (H.R. 3636, S. 1355). This bill is sponsored by the American Public Welfare Association and incorporates the recommendations of the Federal Security Agency. On this subject, the Democratic Platform pledges "improved public assistance for the needy."

DISABILITY INSURANCE

President Truman has recommended that the present old-age and survivors insurance program be broadened to include insurance against the loss of earnings due to temporary or extended disability extending for 6 months or more. No action was taken on this proposal by the 80th Congress. The Social Security Advisory Council in a report to the Senate Finance Committee also recommended the adoption of such a program substantially along the same lines proposed by the President. The Democratic Platform calls for the extension of the social security program to provide for "insurance against loss of earnings on account of illness or disability."

UNEMPLOYMENT INSURANCE

President Truman has recommended that Congress amend the federal law regarding unemployment insurance to extend coverage to at least two important groups now excluded:

1. Employees of small firms - those employing less than eight persons
2. Federal employees

The 80th Congress took no action on this proposal. In the light of the pledge of the Democratic Platform calling for extension of unemployment insurance "to all workers not now covered," President Truman is expected to renew this recommendation to the 81st Congress.

USES: The 80th Congress rejected President Truman's recommendation to retain the United States Employment Service in the Labor Department. In conformity with

the pledge in the Democratic Platform to strengthen this Department, the President may be expected to ask the 81st Congress to transfer the USES and the unemployment compensation functions of the federal government from the Federal Security Agency to the Department of Labor.

VETERANS' AFFAIRS

In the field of veterans' services and benefits, President Truman's general position is that although "some amendments to veterans' legislation may still be required, no major new programs of assistance appear necessary." He emphasized the need for attaining more effective administration of existing programs for veterans. The Democratic Platform pledges "the continuance and improvement of our national program of benefits for veterans and their families." Also -

> "The level of veterans' benefits must be constantly reexamined in the light of the decline in the purchasing power of the dollar brought about by inflation.
>
> "Employment and economic security must be afforded all veterans. We pledge a program of housing for veterans at prices they can afford to pay.
>
> "The disabled veteran must be provided with medical care and hospitalization at the highest possible standard."

The 80th Congress passed several bills increasing veterans' benefits to offset the impact of increased living costs, and appropriated substantially all the funds requested by the Veterans' Administration for medical and hospital care.

HOUSING

The principal housing bill considered by the 80th Congress was the bipartisan Taft-Ellender-Wagner long-range housing bill (Senate bill 866). This bill seeks to establish a permanent national housing policy and a basis for a home construction program designed to average 1,500,000 homes a year during the next 10 year period. In brief, the bill consists of a series of titles providing various aids to the building industry as well as provisions for slum clearance, and subsidized public housing for low-income families.

The bill was passed by a voice vote in the Senate, and a similar bill was reported favorably to the House by its Committee on Banking and Currency. When the bill was considered by the House Committee on Rules (which is responsible for scheduling bills for House debate and action) the housing bill was "tabled" with a 6-2 vote. Opposition centered on the provisions for slum clearance, rural housing, and public housing. When President Truman recalled Congress last summer for a special session he listed action on Senate bill 866 as one of the two "must" items. The Republican leadership countered with a policy statement that "such a program involves serious complications and differences of opinion which cannot be dealt with adequately at this special session" and added that the "million new dwelling units (which) are being constructed this year . . . practically exhausts the materials and labor available for the purpose." Instead, Congress enacted "The Housing Act of 1948" (Public Law 901) which includes virtually all of the aids to private enterprise low-cost housing included in Senate bill 866, but not its provisions for slum clearance, farm housing, and public housing.

When President Truman signed the housing bill passed last summer, he issued a statement declaring that he was approving the measure because it would be of some help in meeting the critical housing shortage. However, he sharply criticized it as failing to make any provisions for slum clearance, farm housing, public low-cost rental housing and also criticized its housing research features as inadequate. He has since stated that he will recommend that the 81st Congress enact housing legislation which will include these provisions. The Democratic Platform pledges: "We shall enact comprehensive housing legislation, including provision for slum-clearance and low-rent housing projects initiated by local agencies."

DISPLACED PERSONS

When the President signed the Displaced Persons Act of 1948, he stated that he did so with "very great reluctance . . . in the expectation that the necessary remedial action will follow when the Congress reconvenes." The provisions to which he objected include:

1. The "cut-off" date of December 22, 1945 which renders ineligible for admission here those persons who entered Germany, Austria, or Italy after this date.

2. The requirement that charges the displaced persons admitted to future immigration quotas of their countries of birth, up to 50 percent of the quota per year.

3. The provision which earmarks 40 percent of the visas for persons from the Baltic states and east of the Curzon line in Poland.

4. The restrictive requirements, such as prior assurance of suitable employment, and "safe and sanitary housing" without displacing a United States Citizen.

The Democratic Platform criticizes this law as imposing "un-American restrictions based on race and religion upon such admissions" and pledges new legislation to admit a minimum of 400,000 displaced persons found eligible for United States citizenship.

ADDITIONAL RECOMMENDATIONS

Among the other recommendations which President Truman has previously sent to Congress and which are also included in the Democratic Platform are the following:

1. A comprehensive anti-inflation program including stronger rent controls and authority to institute a rationing system, as well as price and wage controls.

2. Extension of the coverage of the Fair Labor Standards Act, and the adoption of a minimum wage of at least 75 cents an hour in place of the present 40 cents an hour.

3. Legislation to assure equal pay for equal work regardless of sex.

4. Repeal of federal taxes on the manufacture and sale of oleomargarine.

5. Appropriation of emergency federal funds for the relief of individuals and municipalities affected by floods, tornadoes, and other disasters.

6. A civil rights program as previously recommended to Congress including an anti-poll tax bill, an anti-lynching bill, and a fair employment practices bill.

7. A constitutional amendment on equal rights for women.

MEMO TO SUBSCRIBERS

The following listing of back issues is intended to serve a two-fold purpose:

1. Subscribers may find it helpful in connection with the foregoing material to refer to back issues for background information.

2. New subscribers may wish to obtain back issues which are of special interest to them. The charge is 25¢ per issue.

Issue No. 8 summarizes Senator Taft's health bill to provide federal grants-in-aid to assist the states in providing health, hospital, and medical services for persons having insufficient income to pay the whole cost of such services.

Issue No. 10 summarizes the National School Health Services Bill to provide federal grants-in-aid for school health services.

Issue No. 13 summarizes the long-range Taft-Ellender-Wagner housing bill.

Issue No. 21 summarizes the Public Library Service Demonstration Bill to provide federal grants-in-aid to set up demonstrations of public library service for communities now inadequately served.

Issue No. 23 summarizes the findings and views of the Senate Banking and Currency Committee as to the nation's housing problems and the need for enactment of the long-range Taft-Ellender-Wagner housing bill.

Issue No. 26 summarizes the "National Health Insurance and Public Health Act" which is designed to carry out President Truman's recommendations for a national health insurance program.

Issue No. 27 summarizes the bill reported to the Senate for the creation of a Department of Health, Education, and Security to supersede the Federal Security Agency.

Issue No. 33 summarizes the bill to provide federal aid for elementary and secondary education as reported to the Senate. The amendments approved by the Senate are reported in Issue No. 65.

Issue No. 38 summarizes the bill favorably reported to the House for the establishment of a system of universal military training.

Issue No. 39 summarizes the "Public Welfare Act" which incorporates the recommendations of the Federal Security Agency for revision of the public assistance provisions of the Social Security Act.

Issue No. 40 summarizes the bill to establish an Office of Recreation Services in the Federal Security Agency to aid the states in the development of community recreation programs.

Issue No. 41 summarizes the National Social Insurance Bill which is designed to carry out President Truman's recommendations for the expansion of the present program of contributory insurance to provide protection to virtually all workers and their dependents with protection against loss of earnings due to old age, premature death, and disability of more than 6 months' duration.

Issue No. 43 lists the laws and appropriations approved during 1947.

Issue No. 47 summarizes President Truman's social legislation program as discussed in his state-of-the-union message to Congress in January 1948.

Issue No. 48 summarizes President Truman's budget message to the 81st Congress in January 1948 on both existing and proposed programs.

Issue No. 50 deals with the general subject of federal grants-in-aid programs including: purposes, types, amounts of grants, and problems in need of study.

Issue No. 53 summarizes the report to Congress by the U.S. Children's Bureau of its maternal and child health and welfare programs and the need for expanding them.

Issue No. 54 (supplemented by Issue No. 59) summarizes the provisions of the Local Public Health Services bill to provide increased federal grants-in-aid for local public health services.

Issue No. 64 summarizes the National Science Foundation bill as originally introduced. The amendments which were adopted by the Senate are reported in Issue No. 70, page 375.

Issue No. 65 reports the action taken by the Senate on the bill to provide federal aid for elementary and secondary education and the principal issues involved in this legislation as disclosed by the debates in the Senate.

Issue No. 69 summarizes the recommendations of the Senate Advisory Council on Social Security for expanding and liberalizing the old-age and survivors insurance program.

Issue No. 72 summarizes the act liberalizing subsistence allowances for student veterans; the House-passed bill for Southern regional compacts; and other matters.

Issue No. 76 summarizes President Truman's special social security message to Congress urging adoption of a 5-point program.

Issue No. 79 summarizes the act which temporarily increased the federal share of the cost of the three public assistance programs - old age assistance, aid to dependent children, and aid to the blind.

Issue No. 80 reports the appropriations voted by Congress for the various health, education, welfare, employment and related programs of the Federal Security Agency.

Issue No. 81 reports on several matters including the general provisions of the dental research and heart acts; the appropriations for school lunches, books for the blind, and research on aids to disabled persons; and special housing for paraplegic veterans.

Issue No. 82 reports on several matters including bills to liberalize veterans' benefits to offset increased living costs.

Issue No. 84 summarizes the provisions of the Displaced Persons Act of 1948.

Issue No. 85 gives the President's explanation of his reasons for vetoing the bill to permit states, in determining income and resources of blind persons for purposes of aid to the blind, to disregard earnings up to $40 per month.

Issue No. 87 reports on several matters including the Housing Act of 1948.

Issue No. 88 summarizes the report of the Senate Advisory Council on Social Security with respect to a proposed program for permanent and total disability.

Issue No. 90 summarizes the report of the Senate Advisory Council on Social Security on (1) financial assistance, medical care, and other services for recipients of public assistance, and (2) maternal and child health and welfare services.

Issue No. 92 reports the issues underlying the consideration of proposed health legislation to be studied by the Senate Committee on Labor and Public Welfare.

Issue No. 95 deals with proposals to extend social security coverage to employees of nonprofit organizations.

In the AMA Journal:

December11,1948

From California:

> Then A la meda C ounty Medical S ociety ha s a d vertised a gua rentee of medical care for all who nee it, regardless of their a bility to pa y . From the 750,000 persons in the county, there has not been one bone fide case reported to the headquarters office of a nyone's being refused medical care becaus e of lack of money with which to pay the doctor. The association has also repeatedly adver tised a request for complaints on excessive fees and other unethical a cts, a nd reports that although there ha ve been answers to the request, they have been few, and even these usually proved to be primarily a misunderstanding.

NB. If the A MA approves reasoning like this, then it is time some of the boys took time off to take a course in sociology which would prove to them that not only is Calif one of the richest states in the union, but that Alame da county is largely urban, and wealthy. What about race problems...How much of the actual problem is being overlooked?

IMPLICATIONS OF RECENT AMA ACTIONS

Fight for Control Leads to Rejection of Hawley Proposal

As predicted, the American Medical Association's House of Delegates turned down Dr. Paul Hawley's plan for a national insurance company to coordinate the Blue Cross Hospital Plans and the Blue Shield Medical Plans now operating separately under control of various State Medical Societies.

While Blue Cross leaders and some large Blue Shield Plans (e.g. Michigan and Massachusetts) favor the program, AMA leaders and constituent medical societies who want to maintain local medical control over voluntary health insurance waged a bitter campaign. They won out -- at least for the record.

After the House of Delegates turn-down, Dr. Hawley is reported to have announced his own decision to proceed with a national plan "to stave off Government compulsory health insurance". Dr. Fishbein immediately countered with a statement of "AMA's policy" to keep voluntary insurance down to "the state level but not on the national level".

Objective:- Multi-Million Dollar Lobby

If the AMA does raise a"$3,500,000 political war chest to fight 'socialized medicine'", the organized medical lobby will be a two-headed Goliath with unprecedented financial resources. For this $25 levy on the AMA's 140,000 members is presumably in addition to the continuing drive of AMA's existing propaganda machine, the National Physicians Committee.(NPC). NPC recently appealed for double its current rate of collections approximating a half million dollars in 1948.

What role will NPC play now? Perhaps it will continue its raw smear campaign while AMA and constituent medical societies work on congressmen more subtly through their private patients.

(more)

170

AMA's Move May Disrupt Organization

The House of Delegates' move to raise funds for its so-called "educational campaign" against National Health Insurance may cause a serious split within the ranks of organized medicine.

Responsibility for carrying through on the assessment is thrown upon state and local medical societies. (The AMA's membership exists only by virtue of membership in these constituent bodies.) The $3,500,000 question is: How many of the 2,000 county and 49 state and district societies will actually vote the assessment?

Resistance is inevitable. Many physicians believe in the very National Health Insurance program for which AMA is asking funds to fight. Others, regardless of their position on National Health Insurance, will resent an assessment intended for legislative propaganda to be conducted under the pseudonym of education by societies incorporated for scientific and educational purposes. Certainly legal questions of charter and tax exemption are involved.

The AMA has already been asked by the District of Columbia Medical Society to "more fully explain" the assessment. Furthermore, it is reported that "local physicians resent the secrecy surrounding the AMA's action....."

Lobby Investigation May Affect Further Action

With the medical lobby already spending more than any other single registered group, its activities are marked for sharp public scrutiny. The announced support of President Truman and members of Congress for a thorough Congressional investigation of lobbying may influence the decision of many physicians.

AMA Delegates Not Representative of Rank and File

A study of the composition of AMA's governing body, its House of Delegates, reveals that it does not represent the rank and file of American physicians. A check for age, residence and type of practice of the 155 Delegates (elected by the state medical societies) shows:

1) While nearly 50 per cent of all practicing physicians in the United States are less than 45 years of age, 95 per cent of the Delegates are over 45 years of age. Seventy per cent are over 55 and nearly 30 per cent are 65 years or older.

2) Half of the country's physicians are general practitioners. But there are only 15 general practitioners among the 155 Delegates. Ninety per cent are full or part time specialists.

3) As would be expected from the above, most Delegates come from large cities, few are from rural areas. While 30 per cent of all doctors live and practice in communities with less than 5,000 population, only 8 per cent of the Delegates come from such communities.

(more)

Not All Doctors Wear AMA Blinkers

Do all doctors follow the AMA "party line" against National Health Insurance? The magazine, MEDICAL ECONOMICS, (distributed free of charge to all physicians) recently printed the following results in answer to the question:

"Would you participate in the Wagner-Murray-Dingell program if it became law?"

Yes	15%
No	61%
Undecided	24%
Total	100%

Breakdown by states and large cities showed wide variations. In New England and the Middle Atlantic states, almost half the doctors said "yes" or were "undecided". In some eastern cities, one doctor out of three said he would participate in a National Health Insurance program. A substantial number of others are "undecided".

Considering the stream of condemnation and mis-information regarding National Health Insurance which the AMA has poured out to physicians over the years, instead of an anticipated 85-90 per cent opposition only 61 per cent of all doctors would record themselves against participation. Four out of ten are either open-minded on the subject or ready to participate. Five out of ten Eastern doctors feel this way.

The question which MEDICAL ECONOMICS asked of physicians last Spring was an academic one because most doctors answering it did not expect a national health insurance bill to be enacted in the immediate future. The contrast between answers to a theoretical question and a realistic one has been illustrated twice on a large scale in Great Britain. A plebiscite showing a great majority of British doctors against cooperating with the new National Health Service was transformed, by the time the law actually went into effect last July, into a very large majority who would and did cooperate. The same had happened in 1911-12, at the time of the first British national health insurance law.

The British experience is not a guide for us. But reports, including Dr. Fishbein's own predictions, encourage the belief that when a national health insurance law is passed in this country the great majority of our physicians will participate.

PH centers - diagnostic facil.
Rehabilitation of disabled.

4) T Mat. & child health + welfare services.

5) Triple fed. aid to medical research.
Cancer, heart, chronic disease
Mental health
Dental care

Payment for Med. Care

Only 1 in 5 can afford nec. med. care -
National Health Ins. -

Nat'l Health Ins.

1) Payroll tax - ins. premiums to Nat'l Health funds -
Free choice of Dr. - but Dr. paid from fund -
Each Dr. can decide whether or not to practice under the system -
Prof. & lay ~~other~~ in each city decide method of payment -
No compulsion upon indiv. to participate.
Dr. not compelled to take patient.
Compulsory nature of

PAGE PARTIALLY ILLEGIBLE

plan exagg.

All employers & employees estab. by their Congressional reps. shall pay health premiums — the compulsory feature —

2) Admin. mainly by states & localities & fed govt handles finances —

3) Arg. re insufficient medical personnel: Other parts of health plan to cope with this in long run

Health ins. → ↑ abil. to pay & ↓ greater support

for personnel + facils. —
also better distrib.
Also ↑ incentive for
medical training —
steady effective
demand for
services + facils.,

4) Arg. re high costs:

Admin. costs in
voluntary plans now
about 10-12% —
costs prob. won't be
this high —

5) Arg. that quality of
medical service will
be lowered:
Plan cannot help

PAGE PARTIALLY ILLEGIBLE

- but raises stds. for millions who now have no care - other groups (top 20%) OK anyway -
- As facts, expand, so will services.

- How about rural people & others not on payroll?
- Dep. on Congress - hope to extend Soc. Sec. system -
- ditto health ins. -

Hope to cover self-employed too

How about unemployable etc? —
Not covered unless legisl. will include non-contributory assistance.

Drs. fees —
Under plan — joint prof-lay agreement re approp. fees

for people not covered — fees untouched by plan.

PAGE PARTIALLY ILLEGIBLE

Poor States would gain from national system –

Present voluntary plans, industrial plans, etc. could fit into plan – could even serve as admin. units, etc –

Coverage would probably start on basis of Old Age & Survivors Ins. – which now covers c. 43,000,000 –

Prob. not all services covered at

first a/c 1+d.
personnel + facils.

Dr. Paullin – says if
have better nutrition
educ. housing etc. –
would need to 1
no. of drs. and to
expand med. schools –

How about red tape
for doctors?
Under plan, dr. works
for himself – not
a govt employee –
govt merely collects
fees for drs.

AMERICAN ASSOCIATION OF SOCIAL WORKERS
11 Pryor Street, S. W.
Atlanta 3, Georgia

December 9, 1948

RECEIVED
DEC 13 1947
Regional Council

Dear Member and Friend:

You are cordially invited to attend an open meeting of the Georgia Chapter, American Association of Social Workers, to be held at 7:30 P.M., Tuesday, December 14, 1948, at the auditorium of the Y.M.C A., 145 Luckie Street, N.W.

The proposed national health program outlined by Oscar R. Ewing, Federal Security Agency Administrator, in his recent report to the President, "The Nation's Health - A Ten Year Program," will be discussed by our guest, John L. Thurston, assistant administrator for program, Federal Security Agency, Washington, D. C.

Mr. Thurston has had wide experience in state as well as federal service dating back to 1937. During the war he served as a regional assistant director of the War Manpower Commission. Before assuming his present post he was an aide to John R. Steelman, the President's assistant. His specialty is health and social security.

The topic for discussion is of great interest to us all. Our speaker comes well qualified to assure us an exciting evening. We urge you to attend. Please invite your friends.

Cordially yours,

(Mrs.) Florine J. Ellis
Chairman

National Health Insurance Bills Introduced

National Health Insurance Bills were introduced last week immediately following President Truman's State of the Union message to the Joint Session of Congress.

The President again recommended "a system of prepaid medical insurance which will enable every American to afford good medical care" and forthrightly called for action "without further delay".

The Senate Bill, sponsored again by Senators Murray, Wagner, McGrath, Pepper, Chavez and Taylor is S-5, and the companion House Bill, sponsored by Congressman Dingell, HR-783. The provisions of the measure, introduced as first in a series of Social Security Bills, are identical to those of S-1320 and HR-3548, the Health Insurance Bills introduced in the 80th Congress. Briefly the National Health Insurance Legislation provides:

1. A system of health insurance, national in scope, and covering approximately 85 per cent of the population. This includes employees, self-employed persons in business for themselves, and their dependents.

2. Insured persons eligible for benefits would be entitled to medical and dental service from general practitioners and specialists, home nursing care, hospital care, laboratory service, x-rays, expensive prescribed medicines, eye glasses and special appliances.

3. Free choice of doctor and dentist by the patient is guaranteed, as well as the right to change one's choice.

(more)

170

2 OUT OF 3 AMERICANS CANNOT AFFORD ADEQUATE MEDICAL CARE

4. Every qualified doctor, dentist, nurse and hospital is guaranteed the right to participate or not, and to accept or reject patients. These guarantees apply to organized groups of practitioners, clinics, consumer cooperatives and similar health service plans as well as to individuals. Every hospital that participates is guaranteed freedom from governmental supervision or control.

5. Payments for services would be made from the insurance fund instead of the patients having to pay the costs directly. The method of payment is to be decided by the practitioners who furnish the service. The legislation contains guarantees that the amount of payment will be fair and adequate to physicians and hospitals.

6. Provision is made for grass-roots administration of the program. In each local area, administration would be carried out with the help and participation of local citizens, including members of the medical profession. Each State is given the right to administer the system through its own state agency, and to divide the State into local areas. The State plan must meet certain general requirements stated in the bill. At the Federal level, administration is under a 5-man board, assisted by an advisory council of lay and professional people.

Early Committee Action Hoped For

The legislation was again referred in the Senate to the Committee on Labor and Public Welfare and in the House to the Interstate and Foreign Commerce Committee which has jurisdiction over health legislation. (The revenue and taxing provisions will have to be considered in separate legislation. which will go to Senate Finance and House Ways and Means Committee.)

Early consideration in Committee hearings, possibly through joint sessions, is expected. If subcommittees are established, the press for consideration of other legislation need not interfere with prompt action on the Health Bills.

While Committee assignments have not been completed (as of the date of this writing) the Committee membership is shaping up rather favorably. This is particularly so on the Senate side where the Committee on Labor and Public Welfare consists of:

Democrats	Republicans
1. Elbert D. Thomas - Utah (Chairman)	1. Robert A. Taft - Ohio
2. James E. Murray - Montana	2. George D. Aiken - Vermont
3. Claude Pepper - Florida	3. H. Alexander Smith - New Jersey
4. Lister Hill - Alabama	4. Wayne Morse - Oregon
5. Hubert H. Humphrey - Minnesota	5. Forrest C. Donnell - Missouri
6. Paul H. Douglas - Illinois	
7. Matthew M. Neely - W. Virginia	
8. ....appointment to be made to fill unexpired term of Senator Barkley from Kentucky

FACTS ABOUT THE NATIONAL HEALTH INSURANCE AND PUBLIC HEALTH ACT

(S.5 and H.R. 783)

March 1949

FACTS ABOUT THE

NATIONAL HEALTH INSURANCE AND PUBLIC HEALTH ACT

(S.5 and H.R. 783)

1. WHAT IS THIS ACT?

This measure would provide health insurance for our people regardless of residence, race, creed, color, or economic status. (p.4)*

2. WHAT MEDICAL CARE WOULD I HAVE?

Preventive (check-ups, inoculations, etc. to keep you from getting sick unnecessarily); diagnostic (to find out what is wrong with you when you are sick); and curative (to cure you after you are sick).

This means services by a family physician, services of specialists when required, hospital care (60 days hospital care, except for tuberculosis and mental diseases); laboratory and x-ray services; unusually expensive medicines; special appliances and eyeglasses; dental care and home nursing to limited degree. (p. 5)

3. WILL I BE ELIGIBLE?

Yes, you and your dependents (wife or disabled husband, parents, children if dependent and under 18 years of age), if you are:

a. employed or self-employed
b. receiving old age or survivors benefits
c. receiving civil service benefits

*Page numbers refer to Bill S. 5, 81st Congress, 1st Session.

d. a needy person whose contributions to the insurance fund are paid by a public agency (pp. 13, 65)

4. HOW MUCH WILL I HAVE TO PAY FOR THESE SERVICES?

1½% of your earnings up to $3,600; your employer would contribute another 1½% up to $3,600. If you are self-employed, you would pay 3% up to $3,600 of your own earnings. (pp. 52, 59)

5. WILL I HAVE FREE CHOICE OF DOCTOR AND HOSPITAL?

Yes, you can choose your own doctor, hospital, group clinic, specialist, dentist, or nurse from among all the practitioners and institutions in your community that serve under the Act. (p. 9)

6. WILL DOCTORS CHOOSE THEIR OWN PATIENTS?

Yes. Doctors will be free to accept or reject patients, just as they do now. (p.10)

7. MUST DOCTORS SERVE UNDER THE ACT?

No, not if they do not wish to. By merely declaring he does not want to serve patients under the National Health Insurance Act, a doctor can remain outside of it. (p. 16)

8. WILL MY MEDICAL RECORDS BE OPEN TO PUBLIC INSPECTION?

No, of course not. Your medical records must be held confidential, just as doctors hold such information confidential now. Statistics may be compiled from the records, but the identity of any individual may not be revealed. (p. 44)

9. HOW WILL DOCTORS BE PAID?

They will be paid by the method a majority of the doctors in a given area or locality prefer. Doctors will be paid by a fee-for-each-service, by salary, or on a per capita (so much for each person on the doctor's list) basis; or by a combination of these methods, as the majority may determine. (p. 20)

10. WHAT HAPPENS IF I BELONG TO A VOLUNTARY HEALTH INSURANCE PLAN?

Voluntary health insurance plans could continue to provide you with services under this Act, and be reimbursed from the Health Insurance Fund. (p. 17)

11. HOW WILL THIS ACT HELP ME IF I LIVE IN A RURAL COMMUNITY?

You would have more doctors at your disposal. The Act will make it possible, through added financial aid from the Insurance fund, for more doctors to go to rural areas. It will also help to expand local public health services, rural hospitals, and ambulance service. (p. 68)

12. HOW WILL THIS ACT BE ADMINISTERED?

a. The funds will be collected by the Federal government along with other social security payments. (p. 51)

b. Each state government will divide the state into local service areas and appoint local committees and officers. (p. 29, 33, 34)

c. Doctors and laymen in the localities where the services are rendered and

received will run the program. (p. 25)

d. The local set-up will consist either of a local administrative committee or of an administrative officer working with an advisory committee. Such local committees will include both lay and professional people, appointed by the State. (p. 26)

e. National and state advisory councils will have similar representation. (p.42)

f. At the Federal level, administration will be by a board (within the Federal Security Agency) of five full-time officials. (p. 38)

13. HOW WILL THE HEALTH OF OUR COUNTRY BE IMPROVED?

a. (1) Everybody will be able to get preventive medical services to keep away sickness.

(2) You will get all physicians and hospital services when you are sick, without worry about expense. You pay as you go, a little every month, sick or well. When you get sick, you will have prepaid your doctor and hospital bills.

b. Doctors will be able to practice in rural and poor areas with assurance of adequate income.

c. There will be more money for more hospitals, needed now in many places.

d. There will be funds for grants-in-aid to proper agencies for medical research, for better treatments and cures.

e. Properly qualified persons will be able to get more and better professional training, ending the present shortage of

doctors, nurses, and other medical workers. (pp. 57, 82)

14. IS THIS THE WAGNER-MURRAY-DINGELL BILL?

The present National Health Insurance and Public Health Act is an improved version of the original Wagner-Murray-Dingell Bill, with additional Congressional sponsors.

15. WHO SPONSORS THE NATIONAL HEALTH INSURANCE ACT?

It is sponsored in the Senate by Senators Wagner, Murray, Pepper, Chavez, Taylor and McGrath, and was introduced on January 5, 1949. In the House it is sponsored by Representatives Dingell and Celler.

16. WHAT GROUPS TESTIFIED AGAINST THIS BILL?

The American Medical Association and some of the allied professional groups controlled by the American Medical Association.

17. WHAT GROUPS TESTIFIED IN FAVOR OF THIS BILL?

The American Federation of Labor and the Congress of Industrial Organizations, along with many consumer, church, farm, cooperative, and veteran organizations.

Also supporting the Act are two medical organizations -- The Physicians Forum and the Committee of Physicians for the Improvement of Medical Care.

TO: ORGANIZATIONS INTERESTED IN NATIONAL HEALTH INSURANCE

FROM: Chat Paterson

To keep you posted on important new developments on the national health insurance scene, here are:

1. A SUMMARY, ANALYSIS, AND EVALUATION OF THE HILL BILL, S 1456:**

This bill proposes to subsidize membership in voluntary insurance programs for those who can't afford the premiums. No definition of who is eligible . . . but means test is inevitable. Cost of program not computed.

2. A COMMENT ON THE NEW TAFT BILL, S 1581:**

Same sponsors (minus Ball) . . . . same "charity medicine" dressed up with a few good ideas taken from the national health insurance program.

3. RESTRICTIONS ON FREE ENTERPRISE IN MEDICINE:

An important study just presented to the President last week. It discloses how organized medicine block independently-sponsored health insurance plans through restrictive state laws, boycotts, reprisals, and other professional pressures.

Your members -- especially those living in the 22 states with restrictive laws -- may want copies. Up to 5 copies may be obtained by writing to the Committee. Bulk orders can be arranged at cost ... the price per copy depending on quantity.

A new bill incorporating President Truman's health program will be out shortly. More on this soon.

** Extra copies available at your request.

America needs "a system of pre-paid medical insurance which will enable every American to afford good medical care . . . without further delay."—President Harry S. Truman, January 5, 1949.

SUMMARY OF THE VOLUNTARY HEALTH INSURANCE BILL, S. 1456

(Sponsored by Senators Lister HILL (D. ALA.); Herbert O'CONOR (D. Md); Garrett WITHERS (D. Ky.); George AIKEN (R. Vt.); Wayne MORSE (R. Ore.). Introduced March 30, 1949.

PURPOSE: To provide federal and state supported memberships in voluntary non-profit health insurance programs to all persons unable to afford the premuims.

Promote enrollment through employer participation; extend voluntary programs in rural areas.

Coordinate and strengthen each state's existing health facilities.

SERVICES: Insurance against the cost of surgical, medical, diagnostic and out-patient clinic services in a hospital up to 60 days per year.

COVERAGE: Only people who cannot afford to join voluntary plans. Under Surgeon General's guidance, each state agency would set up tests to determine who is "unable to pay subscription charges", in whole or part. A "service card" entitling that person to membership in a voluntary plan would be issued.

HOW FINANCED: Bill calls for a "sum sufficient" to meet these expenses. Amount is unspecified. Sponsors say it can't be determined until after each state surveys its needs.

States are required to match federal grants on a sliding scale from one third to three quarters, depending upon population and per capita wealth. Both federal and state funds would come out of general tax revenues.

FEDERAL ROLE: The Surgeon General, with approval of the Federal Hospital and Medical Care Council, and Administrator, sets overall standards: for the state agency to determine who is eligible; the qualifications of prepayment non-profit health insurance plans; the general operation of the state agency.

The ten-man advisory Federal Hospital and Medical Care Council would be appointed by the Administrator for five year terms. Four members must be either doctors or hospital administrators. Two members must be experienced in voluntary insurance plans. Four members, familiar with needs, must represent consumers.

STATE ROLE: A state desiring to participate shall submit a plan to the Surgeon General which must:

a--designate a single state agency as the administering body
b--set up a state council with same ratio of representation as federal council; intra-state regional councils are quired, but no ratio is fixed
c--provide for the issuance of "service cards" to certified needy persons for membership in a voluntary plan
d--prepare to reimbuse the voluntary plan for expenses of such needy or unemployed
e--survey and map expansion program for diagnostic facilities, care for mental, tuberculous, chronic disease and long term patient
f--recommends methods to encourage medical practice in rural areas.

3/31/49

ANALYSIS OF SENATOR HILL'S "VOLUNTARY HEALTH INSURANCE" BILL (S. 1456)

The bill proposes to authorize grants "so that hospital and medical care may be obtained by all persons." Those "unable to pay all or part" of voluntary plan charges would be given "service cards" entitling them to protection against the costs of hospital and medical care.

These objectives are highly laudable. But examination discloses that they cannot be accomplished by this bill. The measure suffers from 7 very grave defects:

MEDICALLY INCOMPLETE: The bill does not meet the average family's day-to-day medical needs. It offers no protection against the costs of routine illness, check-ups or innoculations etc. Nor does it provide for the services of a family doctor or specialist in home or office. It does not provide for preventive medicine.

IT IS A BLANK CHECK: The sponsors do not even attempt to estimate how much this program will cost the taxpayer. How many billions it will drain from the Treasury annually will depend on where each state wants to draw the line between those who can afford voluntary plans and those "unable to pay the costs".

Today, less than one out of every 50 persons is enrolled in voluntary programs offering reasonably complete protection.

CHARITY MEDICINE: To be eligible for a "service card", an individual must apply to a bureau and declare his inability to afford the fees of a voluntary program. This, in effect, constitutes a medical dole.

INADEQUATE ADMINISTRATION: Most voluntary medical care programs, such as Blue Shield, vest control even over such non-professional matters as administration, fees, extent of services etc. with doctors and deny it to consumers. Thus, while the general taxpaying public will foot the bills, it will be denied a majority voice on the federal and state advisory council.

This sets a very dangerous administrative precedent.

MAL-DISTRIBUTION: Voluntary health insurance plans are entirely inadequate to carry a nation-wide load. The largest combined plan which would qualify under the bill is Blue Cross-Blue Shield. About 10 million people have such combined coverage today. Of these, 8½ million live in seven high income states.

FOR RURAL AREAS - ONLY A PROMISE: The bill states the need to bring medical and hospital facilities to rural areas. Yet it purposes no concrete aids, offers no inducements by way of scholarships to medical students, ambulance service, subsidy to young doctors settling in rural areas or other aids such as is proposed in the President's program. Rural people eligible for "service cards" would seldom find a voluntary program in their areas to cover their medical or hospital costs. Less than 3 per cent of America's rural population presently subscribe to Blue Cross, thereby receiving hospital protection.

VOLUNTARY COVERAGE IS INCOMPLETE COVERAGE: Even among the more comprehensive voluntary prepayment plans, subscribers today are protected on the average for only 35 per cent of their annual sickness bill. Even where the items of service are covered, only 65 to 85 per cent of the bill is defrayed by insurance.

In general, voluntary plans are not a national solution to our national health problem because:

a. Benefits are inadequate. Comprehensive insurance protection reaches relatively few persons - actually less than 3% of the population. They have been held back by the opposition of medical societies. The plans sponsored by medical societies provide only very limited services.

b. Voluntary plans have no sliding scale of payments to match incomes. They charge a flat rate, usually high, for limited benefits that cover only a fraction of the population.

c. Many plans offer only cash payments instead of actual medical services. These payments cover only part of the costs of care.

d. They have the smallest coverage where the need is greatest - in rural areas and among lower income groups.

SUMMARY

Senator Hill's bill represents a small step - and in the wrong direction. It turns the clock back to the "charity principle" of the 19th century.

By way of contrast, "The National Health Insurance and Public Health Program" (S. 5) sets forth a comprehensive health program, as recommended by President Truman in several messages to Congress. This bill includes insurance against the costs of medical care for practically everyone, federal aid to the states for public health, for research and for medical education, for maternal and child health programs, for hospital construction. The program would be administered with federal, state and local participation, with emphasis on local responsibility.

The National Health Insurance Program is based on the principle that people should pay their way in proportion to their means, in this case by small regular payments into the insurance fund, and should therefore have needed medical services as a right, not as a charity.

President Truman said in his special Health Message to Congress May 19, 1947, regarding national health insurance: "It is - in the long run - far less costly and more effective than public charity or a medical dole."

On the other hand, the so-called voluntary health insurance bill, S. 1456, is based on the principle of public medical charity. It would establish a means test, thereby necessitating a bureaucracy to investigate constantly into what category every American family will be placed. Local participation and local responsibility are not provided. It pins its faith on voluntary programs which give inadequate coverage, have high administration costs, and cannot possibly substitute for a national health insurance program.

STATEMENT BY DR. CHANNING FROTHINGHAM
Chairman, Committee for the Nation's Health

(Dr. Frothingham has twice been president of the Massachusetts Medical Society)

"The so-called 'health insurance bill' introduced today (March 30) by Senator Lister Hill and a group of other Senators is either a fraud on the American people or a proposal to appropriate billions of dollars out of the Treasury without any assurance that it will provide adequate medical care. It is impossible to decide which category the bill falls into because it is so vague in its terms. But it cannot escape one or the other of these two classifications.

"The ambiguity of the bill is its failure to define the persons 'unable to pay the costs' of medical care who would be eligible for federal help. Would these include only the bottom 20 per cent, as in the Taft proposal, or the bottom 50 per cent? If only the bottom 20 per cent, then it only includes those families making less than $1200 a year and therefore chiefly those already dependent on charity.

"The real problem we are trying to meet with our proposal for national health insurance is the families making between $1200 and $5,000--which includes about 90 million people. How many of these would Senator Hill include? If he goes up to $3,000--the figure which the AMA fixed ten years ago as the level of medical independence--he covers most of the people and provides for paying

billions of dollars out of the Treasury. Perhaps that is why his bill carries no limitation on the appropriation.

"On the other hand, unless he goes at least that high he does not begin to meet the medical problem facing the nation. He and his colleagues apparently assume that because 52 million people have some kind of medical or personal insurance the problem is well on the way to solution. But do they realize that in 1947 all of these voluntary plans combined paid only 10 per cent of the nation's medical bill because the protection provided under these voluntary plans is so limited?

"Who is going to pay the other 90 per cent? Does Senator Hill propose to pay it out of the Treasury as the British are now doing? Now isn't it more sensible to do as the President proposes--collect a nominal amount from every worker every pay day to insure his medical costs of all kinds? That is the sensible, sane and American way of doing the job.

"It would involve no means test, no bureaucracy of social workers to investigate the financial status of all families and no invasion of private rights. It would leave the patients and the doctors as free as they are today. It would provide local administration whereas the Hill measure would set up a centralized authority to decide who is eligible for charity and who is not."

A COMMENT ON TAFT BILL

Senator Taft's bill is an old political substitute for national health insurance now decked in new phrases. But it is still charity medicine - poor man's medicine - replete with a means test and all the odious implications involved. It was decisively opposed in the last Congress by every major public interest group and will undoubtedly be rejected again this year. This bill is inimical to the sound financing of medical care. It is unsound to administer.

Representatives of labor, farm, coops, veterans, professional and women's groups have repeatedly testified that the American people want - and sound medical practice requires (1) that funds be handled by experienced local administrators; (2) that they be responsible to the people in each community footing the bills. This is scrupulously provided for in the National Health Insurance plans.

Yet the Taft measure ignores this sound principle and allows organized medicine to decide how the public's money shall be spent. The people who pay the bills are denied any real voice. Organized medicine would run the whole show.

To turn control over to the local medical societies, lock, stock and barrel, is simply to invite and subsidize all the abuses practiced by organized medicine, as shown by the report just presented to the President. Medical societies, in blocking all voluntary plans they cannot dominate, have proved the folly of this proposal. For, in effect, it blindly empowers these monopoly groups to decide which plans shall receive public funds for medical care to the needy. It is a safe prediction that comprehensive consumer sponsored plans, now fought by medical societies, will be frozen out.

Worst of all, the Taft bill fails to meet the real health needs of the American people. Our basic problem is not the penniless. They are but a small portion of the population and most of them now get medical care. Our real problem is to enable four fifths of our people - the great middle class making less than $5000 annually - to meet the high costs of medical care. The Taft bill does nothing for these self-respecting people. Instead of sensibly meeting these costs through a pay-as-you go national health insurance plan covering everybody, Senator Taft merely proposes a return to a medical dole for the indigent.

To receive benefits under the Taft bill, a person would first have to be certified as needy, after investigation of his finances. This is humiliating to recipients, destructive to our democratic principles, and inevitably requires a means test and a bureaucracy of investigators.

Ever since the introduction of social security, the American people have renounced the means test and the tactic of reducing people to accept charity.

The sharpest indictment of the grave threat in the Taft bill to our democracy comes from the author himself. Referring to the dangers of the "means test" in his bill, the Senator blandly admitted: "Unquestionably it does deprive the recipients of charity of some freedom, but as long as four fifths of the people remain their own bosses, there is no serious infringement on the principle of liberty for the entire people."

With this concept of "Taftonian democracy" announced at Pittsburgh only a few months ago (February 19, 1949), the Senator is publicly recorded ready to write off freedom for a considerable portion of the American people with his so-called health bill.

REPORT TO TRUMAN CHARGES
MEDICAL MONOPOLY BLOCKS
VOLUNTARY HEALTH INSURANCE

Monopoly practices of the American Medical Association's state and county societies are depriving American families of better and more comprehensive medical insurance plans at reasonable costs, according to a study presented to President Truman at the White House today by the Committee for the Nation's Health.

The report entitled "Restrictions on Free Enterprise in Medicine," was prepared by the Committee on Research in Medical Economics, under the chairmanship of Michael M. Davis, Ph.D., noted authority on health insurance.

The twenty-four page document discloses that state and local medical societies use restrictive state legislation, boycotts and other professional pressures to block the growth of health insurance plans providing comprehensive medical services and sponsored by industries, unions, cooperatives, farmers and other consumer groups. Special laws instigated by medical societies have been enacted in 22 states, in effect preventing the establishment of voluntary health insurance plans unless these are controlled by organized medicine.

These states are: Alabama, California, Florida, Illinois, Iowa, Kansas, Kentucky, Louisiana, Maine, Massachusetts, Michigan, Minnesota, Montana, New Hampshire, New Jersey, New Mexico, North Dakota, Ohio, Pennsylvania, Rhode Island, South Carolina, and Tennessee.

The report traces the two principal restrictions imposed by these laws on right of free enterprise in medicine:

MORE.....

"The managers and workers of an industry, the members of a labor union, the people in any other group who receive health services and pay the bills, cannot establish a health insurance plan with the doctors of their choice. Plans sponsored by such non-medical society groups have usually been designed to provide comprehensive medical service, preventive and curative, whereas the plans set up by medical societies, with a few exceptions, provide a limited scope of service--usually only surgery and obstetrics. There is much loss in preventing the development of comprehensive service insurance plans."

"Such laws also restrict professional freedoms on the part of the doctor. A doctor cannot join with a number of selected associates to practice as an organized professional group and then make contractual arrangements with prospective patients who would like to receive care from the group and to pay for this care on an insurance basis."

The report also describes efforts by organized medicine to fight local consumer sponsored insurance plans in Oklahoma, California, Oregon and the District of Columbia. (The Department of Justice has announced that pre-trial hearings in the government's anti-trust case against the Oregon State Medical Society, et al. are set for April 18, with the trial itself scheduled to begin June 7.) These cases, says the report, "exemplify a nation-wide pattern of behavior by the American Medical Association and its state and county subsidiaries." Similar pressures are operating "beneath the surface in other states and counties," according to the study.

Dr. Channing Frothingham, past president of the Massachusetts State Medical Society and chairman of the Committee for the Nation's Health, told President Truman, "Here is evidence that the 140 million consumers of medical care cannot hope to get the comprehensive protection they need from voluntary health insurance plans because of organized medicine's monopoly controls."

The report declares:

"The medical societies not only refuse to sponsor the type of health insurance plan which high professional opinion has recommended as able to offer the most ade-

MORE.....

quate medical service at reasonable cost, but also have endeavored to prevent their individual physician members from participating in such plans.

"They have choked the development of medical insurance plans offering comprehensive health services, in favor of plans offering only very limited services.

"They have restrained doctors from free experimentation in improved forms of medical service and have prevented the people from experimenting with improved methods of payment for service.

"Such policies are un-American restrictions upon free enterprise in medicine. They are disadvantageous to the public. They are a blot upon the medical profession. Foresighted, fair-minded physicians ought to assist labor, business, farm, cooperative and civic organizations in removing these restrictions promptly from the American Scene."

The Study declares that the AMA defends its opposition to consumer medical plans on the ground that it is guarding the "standards and quality of medical service." But states the report, on the basis of past operations "the medical societies cannot claim that the health insurance plans which they control guarantee the quality of professional care." On the other hand, the study points out, many of the consumer operated plans do provide high quality of medical care through group practice and preventive medicine which have been repeatedly recommended by professional authorities.

Dr. Frothingham said: "If organized medicine is sincere in its new found admiration for voluntary health insurance (which it once condemned as a "half-baked scheme...socialism and communism... inciting to revolution") let it join with consumers, farmers, and labor to repeal these restrictive laws and to stop its county societies from boycotting tactics. Let the public and the doctors alike be free to develop and maintain sound prepayment plans."

LEGISLATIVE MEMORANDUM

NATIONAL HEALTH INSURANCE HEARINGS BEGIN MAY 16

Hearings in the Senate on health legislation begin this week. The first bills to be heard before Senator Murray's Subcommittee on Health are a series of bills dealing with particular diseases (epilepsy, arthritis, rheumatism, etc.)

The National Health Insurance and Public Health Act, S. 1679 (see enclosed summary), Senator Taft's "health" bill, S. 1581 (similar to S. 545 of last year), and Senator Hill's "voluntary" health bill, S. 1456, and Senator Lodge's "drug" bill, S. 1106, are the major bills dealing with the problem of paying for health and medical services. Hearings on these bills are scheduled by the Murray Subcommittee to begin Monday, May 16. No terminal date has been announced.

Senator Murray has stated that his Subcommittee "was unanimous in its desire to conduct hearings which will be both thorough and expeditious" and has therefore "asked Senator Hill's Subcommittee to take over certain relatively non-controversial titles appearing in several bills." Senator Murray added "we intend to hold hearings on the balance of these major bills concurrently."

This means that before May 16, hearings on legislation offering amendments to the Hospital Survey and Construction Act and bills proposing to extend public health services will be conducted by Senator Hill's Subcommittee as follows:

Wed., May 4	Hospital Construction	S. 614
Thurs., May 5		Title III of S.1679
Mon., May 9		Title IV of S. 1581
Tues., May 10	Public Health Legislation	S. 522
		Title V of S. 1679
		Title V of S. 1581

America needs "a system of pre-paid medical insurance which will enable every American to afford good medical care . . . without further delay."—President Harry S. Truman, January 5, 1949.

The Hospital Construction Amendments offered in S. 614 (Hill, Taft, Ellender and Smith) and Title IV of the Taft-Smith-Donnell Bill S. 1581 are practically identical. Senators Pepper and Holland have offered amendments to S. 614. The amendments in Title III of the omnibus National Health Insurance and Public Health Act, S. 1679, are similar, but in some important respects liberalize the Act much more fully.

Attached is a table of comparison which may be of interest to you and serve as a guide in the presentation of testimony on the legislation.

TESTIMONY

If your organization wishes to testify on any of the pending bills, write, wire, or phone Mr. Earl Wixcey, Chief Clerk of the Senate Committee on Labor and Public Welfare, U. S. Capitol.

Important to emphasize the fact that if we provide more facilities and personnel for health and medical care, we must also make sure that the people are able to pay for their services.

SENATE COMMITTEE ON LABOR AND PUBLIC WELFARE

Subcommittee on Health:

Senators:

Murray, Chair.	(D. Mont.)
Pepper	(D. Fla.)
Humphrey	(D. Minn.)
Neely	(D. W.Va.)
Taft	(R. Ohio)
Smith	(R. New Jer.)
Donnell	(R. Mo.)

Subcommittee on Hospital Construction and Public Health Units:

Senators:

Hill, Chair.	(D. Ala.)
Douglas	(D. Ill.)
Withers	(D. Ken.)
Taft	(R. Ohio)
Smith	(R. New Jer.)

HOSPITAL CONSTRUCTION AMENDMENTS

	Present law	S. 614, 1581	S. 1679
LIFE OF PROGRAM	Expires on June, 1952	Extends program through June 1955. [S.614, Sec. 2(a); S. 1581, Sec. 401 (a)]	Extends program through June 1957 [Sec. 307, p. 53]
ANNUAL APPROPRIATION AUTHORIZED	$75 million	Increases to $150 million [S. 614, Sec. 2 (b); S. 1581, Sec. 401 (b)]	Increases to $150 million [Sec. 312 (b) p. 64]
FEDERAL CONTRIBUTION FOR CONSTRUCTION OF PROJECTS	May not exceed 1/3 of the cost	Matching formula liberalized so that all approved projects within a state might receive a federal contribution of from 1/3 to 3/4 of the costs, depending upon the state's per capita income. [S. 614, Sec. 3 (a) and (b); S. 1581, Sec. 402 (a) and (b)] Pepper-Holland amendment to S. 614 would make the liberalized formula retroactive.	Matching formula liberalized so that approved individual projects might receive a federal contribution of from 1/3 to 2/3 of the costs, depending upon standards and priorities determined by the State [Sec. 306, p. 52] This liberalized formula is made retroactive so that it may apply to projects approved prior to the enactment of this amendment. [Sec. 312 (c), p. 64]
PROJECTS ELIGIBLE FOR AID	"Includes public health centers and general, tuberculosis, mental, chronic disease, and other types of hospitals, and related facilities such as laboratories, out-patient departments, nurses' home and training facilities - operated in connection with hospitals, but does not include any hospital furnishing primarily domiciliary care";	No Change	The provisions are broadened so as to include "facilities for the group practice of medicine and dentistry (or both) by or for a cooperative or other non-profit corporation or association." [Sec. 305, p. 52 and Sec. 309, p. 59]

	Present law	S. 614, 1581	S. 1679
GRANTS FOR STUDIES AND DEMONSTRATIONS IN THE COORDINATION OF HOSPITALS AND RELATED FACILITIES ON A REGIONAL BASIS	No provision	[S. 614, Sec. 5; S. 1581, Sec. 404]	[Sec. 336, p. 63]
AID TO STATES FOR ADMINISTRATIVE EXPENSES			Annual appropriation of $1 million [Sec. 303 (b), p. 49]
REQUIRING MINIMUM FUNDS FROM THE STATES FOR ADMINISTRATION		[S. 614, Sec. 4; S. 1581, Sec. 403, p. 40]

Re: MAJOR HEALTH BILLS BEFORE CONGRESS

Here is an analysis of the three major health bills before Congress. This was prepared in response to your requests for a comparison of the basic principles, finances and operations of the NATIONAL HEALTH INSURANCE BILL (S. 1769); the TAFT BILL (S. 1581) and the HILL BILL(S. 1456).

You received copies previously of the Hill bill and of the new comprehensive National Health Insurance bill. We can furnish you with more copies if you desire. To complete your legislative set, you will receive a summary of the Taft bill in the next few days.

May we remind you that the Senate Subcommittee on Health under Senator Murray will start hearings on these bills May 16. The Subcommittee on Health of the House Interstate and Foreign Commerce Committee will start independent hearings May 17. If your organization wishes to testify and has not yet requested time, phone, wire or write to the Clerk of both the House and Senate Subcommittees. Your testimony will gain effectiveness through presentation to both House and Senate members.

If you will send us advance prepared statements of your testimony, we shall try to help you obtain the fullest possible press and radio coverage.

America needs "a system of pre-paid medical insurance which will enable Americans to afford good medical care . . . without further delay."—President Harry S. Truman, January 5, 1949.

CAN THE HILL OR TAFT BILLS OPERATE WITHOUT A MEANS TEST?

Some sponsors and supporters of these bills declare that no means test would be necessary to determine eligibility for aid under these bills. Is this view correct?

"Eligibility" Easily Determined for the Indigent Only

Persons who receive their subsistence from public funds (usually through welfare departments) are already certified, after a means test, as also unable to pay for medical care. Therefore, these persons could be certified without additional investigation as eligible for benefits under the Hill or Taft Bills.

Major Problem Not the Indigent

Such persons, however, constitute a very small percentage of the population at the present time. The real problem concerns self-supporting persons who are "unable to pay all or part" of the cost of medical care or of the subscription charges of voluntary insurance plans.

Family Income as the Test?

Hill bill supporters propose as one way to determine eligibility: set a family income limit. If Joe Doakes and his family are below the specified income limit, they would be able under the Hill bill to get subscribers' cards in a Blue Shield and Blue Cross plan, either without charge, or by paying part of the premium.

Ascertaining Family Income Requires a Means Test

Joe Doakes' pay check may be much less than his family income. His wife or one or two of his children may be wage earners and they may work for several different employers. Almost 1/3 of all families in the United States have more than one earner.

When two or more wage earners are in a family, especially when they work for more than one employer, the family income cannot be determined until after Joe Doakes has filled out a family income form which must then be checked through individual investigations by an official agency.

In other words, the use of family income as the test of eligibility would require a means test.

What Would Happen Without a Means Test?

Could eligibility be determined by individual income, judged by the weekly or monthly earnings of an employee, and ignoring size of family and other factors?

Yes - it is administratively practicable to define those income groups which are below a specified limit and therefore could receive benefits under the Hill Bill. If an employee's pay check is taken as the criterion of his ability to pay, no other test would be necessary.

The Dilemma

However , serious inequities would result from using this method. John Doe and Joe Doakes and Tom Brown for instance, side by side with the same rate of pay. John is a man of 40 with a wife and three children. Joe is 30 with no dependents. Tom has a wife and an 18-year old son, both at work. Tom's pay check is the same as John's or Joe's but represents only half of his family income.

Many working families are affected by such situations. The "rough and ready method" of basing eligibility on the individual pay check would therefore raise an immense amount of trouble.

The Means Test is Costly and Objectionable

Departments of public welfare and many private philanthropic organizations have had long experience with the means test. They know that determining a family's ability to pay for medical care requires skilled investigation.

Moreover, it is difficult at best to determine ability to pay for medical care in general, as would have to be done under these Bills. Most welfare departments and medical social workers have to determine eligibility only after need arises for care in a particular illness. The probable cost of the illness is one of the important elements in ability to pay.

To be done well, the means test must be fair to families and at the same time prevent abuse of public funds. This calls for many employees and is costly. If done in a slap-dash way, it may be cheaper but it is also full of mistakes.

The mistakes would prevent some people from obtaining needed care. They would let other people get care who are not entitled to it, and then would give rise to a flood of embittered complaints which would be administratively costly and difficult to handle.

Conclusion

A means test is necessary to the Taft and Hill bills if injustice to individuals is to be avoided and if public funds are to be safeguarded.

RECEIVED
MAY 9 1949
Southern Regional Council

COMPARISON OF THE THREE MAJOR HEALTH BILLS

BEFORE THE EIGHTY-FIRST CONGRESS

1. The National Health Insurance and Public Health Bill (S. 1679; H.R. 4312, 4313) is a comprehensive health program. Its sponsors are Senators Thomas (D.Utah), Murray (D. Mont.), Pepper (D. Fla.), Wagner (D. N.Y.), McGrath (D. R.I.), Humphrey (D. Minn.), Chavez (D. N.M.), and Taylor (D. Idaho); Representatives Dingell (D. Mich.) and Biemiller (D. Wis.). This bill incorporates the recommendations in President Truman's special message.

2. The "Voluntary Health Insurance Bill" (S. 1456), sponsored by Senators Hill (D. Ala.), Withers (D. Ky.), O'Connor (D. Md.), Aiken (R. Vt.), Morse (R.Ore.). No companion House bill.

3. The "National Health Bill" (S. 1581), sponsored by Senators Taft (R. Ohio), Smith (R. N.J.), and Donnell (R. Mo.). No companion House bill.

Under National Health Insurance, present expenditures for medical care would be channeled through a national health insurance fund. By stabilizing purchasing power, the fund would enable almost all Americans to enjoy adequate medical care at little increased cost.* National Health Insurance uses general taxation only in minor degree--for certain special services only.

The Hill and Taft bills would appropriate funds from general taxation to subsidize the inadequate purchasing power of an unspecified but limited portion of the population.

---

*George Soule's recent study, "The Costs of Health Insurance," estimates that even if the employer passed on his 1½% to consumers, nevertheless the total 3% of payroll costs would come to no more than workers now average for physicians and hospital services. Copies of this report can be secured on request from the Committee for the Nation's Health.

The Hill and Taft Bills--an Overall Analysis

Both bills are politically vulnerable because they rest on the charity principle. Widespread and strong opposition to "charity medicine" was demonstrated in the Senate hearings of 1946 and 1947. It should be demonstrated again this year.

The Taft bill does not authorize, and the Hill bill would be unlikely to lead to the authorization of sufficient appropriations from general revenues to serve more than a small fraction of the population. Just to support a poor-man's system of medical care for only 20 per cent of the population would take an appropriation of about a billion dollars a year.

Some of the proponents of these bills, however, hope to solve enough of the medical-cost problem to:

(a) pay the deficits of hospitals either directly or via Blue Cross;

(b) take the edge off demands for national health insurance.

Both the Hill and Taft bills provide an administrative set-up which would place control in the hands of organized medicine and its allies. The Hill bill would put Blue Cross and Blue Shield plans in a position to control all voluntary health insurance in the United States. It would probably choke all other types of plans, except commercial insurance. There is nothing in the Taft bill to prevent a similar development in many states.

The Hill bill would extend partial medical service, limited almost entirely to hospitalized illness. This system would be under the control of private organizations. Large sums of public money would be disbursed without public accountability or supervision. The Taft bill would permit states to establish such a system.

The Charity Principle

The Hill and the Taft bills propose extending the charity principle to the large number of persons who are ordinarily self-supporting but who "cannot afford to pay the whole cost" of needed medical care. The Taft bill allots insufficient funds to achieve this end. The Hill bill calls for no specific appropriation. It

would pay federal funds (supplemented by state funds) to voluntary health insurance plans, through which persons unable to pay these premiums could receive some needed services.*

National Health Insurance rejects the charity principle, is based on providing benefits as a right to all contributors and their dependents in return for a very small pay-roll deduction.

The Means Test

The Taft bill, as did its predecessors, requires a means test.

Possibly to avoid widespread opposition to this charity principle, some Hill bill supporters suggest that no means test is required. The bill itself does not define any standards of eligibility or methods of determining it.

The means test cannot be effectively avoided in either the Hill or Taft bill. Suggested alternatives to a means test are either impractical or inequitable. A full treatment of this issue is contained in the attached memo, "Can A Means Test Be Avoided Under the Hill and Taft Bills?"

Care of the Indigent

All three bills recognize that a small fraction of the population is now dependent upon charity. They could not belong to any contributory health insurance plan unless premiums are paid in their behalf.

National Health Insurance provides for such payment by state and local governments into the national health insurance fund. This policy would tie in with established practices of some public welfare departments and with the programs of liberalized public assistance incorporated in the Forand and Doughton bills

---

*The title of the Hill bill and the publicity about it implies that government funds would pay the premium charges in Blue Cross and Blue Shield plans for eligible persons; that these persons would receive membership cards in these plans. Actually the Hill bill provides that the government funds would be used to pay hospitals and physicians directly for services rendered such persons.

(H.R. 2645 and 2892), recently heard by the House Ways and Means Committee.

The Hill and Taft bills would treat as charity cases both those who are now dependent on public assistance and persons who are otherwise self-supporting and able to pay their medical expenses if insurance premiums were scaled to earnings. The latter can be accomplished only through national health insurance.

Private Control of Public Funds

The Hill bill would hand over large but as yet unspecified funds to private organizations with no provision for public accountability, for standards of service and of administration, or for any public supervision to maintain standards or to require reasonable economy.

The Taft bill would permit similar loose policies on the part of states.

In both bills, administration on federal and state levels would be essentially in the hands of organized medicine and its allies.* Under the Hill bill, the federal advisory council and the corresponding state councils would have a majority of physicians, hospital administrators and voluntary insurance plan administrators. Furthermore, these councils would not be merely advisory, but would have power to approve or disapprove administrative action.

The overall administration of the Taft bill would be under the proposed new "National Health Agency" in which preventive and curative medicine would be separated. The Public Health Service would operate apart from the medical care program. The new "Office of Medical, Dental and Hospital Services" would run this program and be under the direction of a physician. The federal and state councils would be mainly professional, with only minor public representation.

Under the National Health Insurance Bill, the principle of public responsibility is maintained throughout. Local, state and federal bodies, whether advisory

---

*Neither bill provides for local responsibility as does the National Health Insurance Bill.

or administrative, are required to have a majority of representatives of the public (labor, farmers, and other "consumers" of medical care), the professions and the hospitals. The only exceptions are committees dealing solely with professional matters.

How Many Would the Taft Bill Cover?

The Taft bill authorizes a specified annual appropriation rising to a maximum of $300 millions. Let us make the liberal assumption that state contributions of new money would make a total of $500 millions a year. Senator Taft has repeatedly stated that his bill is designed to take care of the very low income groups only. It should be recognized that they would require more expensive care per individual than the population as a whole.

Under these conditions, not more than 10 million persons could be furnished care by a half-billion dollars under the Taft bill. This would mean only those families with incomes under $1000 a year who already are on charity.

How Many Would the Hill Bill Cover? What Would It Cost?

Cost is not estimated nor is an appropriation authorized. The lower the income set by each state, the fewer people would be helped and the less the cost. And vice versa.

Suppose that the Hill bill made it possible for 10 million low income people to enroll in Blue Cross-Blue Shield plans. What would the cost be?

Since these individuals require considerably more medical care than the general population, the per capita cost would average at least $50 annually. Total cost would come to half a billion dollars each year--and for only a small part of our people.

To double present Blue Cross-Blue Shield enrollment would require an annual per capita cost of $30. Total cost for the federal government would come to a billion dollars each year. Even so, only a minority of the population would be covered--and for hospitalized illness only.

Effects Upon Existing Voluntary Plans

The limited medical and hospital services provided for in the Hill bill correspond generally to the specifications of a combined Blue Cross-Blue Shield plan.

The state health departments under the Hill bill would usually be the administering agencies. They are in most instances deeply influenced by the state medical societies. The state advisory bodies under the Hill bill would be controlled by those interested in Blue Cross and Blue Shield. Such an administrative set-up would almost certainly lead to the framing of regulations that would practically place Blue Cross and Blue Shield in control of all non-profit health insurance in the United States.

Under the Taft bill, the Administrative set-up would probably have similar results although there is some chance for variation among the states.

Neither the Hill nor Taft bill bars a state agency from contracting with one voluntary insurance plan or with one type of plan to the exclusion of others.

The National Health Insurance Bill specifically provides against such action. It recognizes various types of eligible plans, including cooperative and other consumer sponsored health plans.

How Would Cooperatives and other Plans Providing Comprehensive Medical Services Be Affected?

The Hill bill virtually restricts services to hospitalized illness. Hence insurance plans providing comprehensive services could get aid in enrolling low-income subscribers for part of their services only. They would have to charge these subscribers additional for home and office care. This obviously would raise great difficulties for both consumers and the administrators of the plans.

The regulations drawn by state agencies would probably place group-practice comprehensive plans at such a disadvantage that no more could be organized and existing ones would be gravely endangered.

National Health Insurance provides payment for actual services received, therefore is not concerned with mere cash indemnities. Voluntary insurance plans providing or organizing services would be recognized.

How Would the Hill Bill Affect Commercial Insurance Companies?

Insurance companies writing cash indemnity policies for surgical services and hospitalization could get aid from public funds in states where Blue Shield operates through insurance companies. At present, there are six states in which the Blue Shield plan makes no contracts with subscribers for services but merely recommends a list of approved insurance companies.

As the Hill bill is now written, private insurance companies would thus be able to get public funds to pay part or all of the cost of policies for eligible persons. Presumably they could also obtain reimbursement of their administrative expenses for enrollment of new eligible subscribers.

Special Health Bills

The Sub-Committee on Health also has before it special bills such as federal aid to professional education. This subject is also dealt with (in different ways) in Title I of the National Health Insurance Bill and in Title VI of the Taft bill.

Aid to professional education is closely related to national health insurance, since there is little use in training many more doctors, dentists and nurses unless the people--especially in low income states and rural areas--have the purchasing power to support this additional personnel in the places and for the people that need them. National health insurance is necessary to create that widespread purchasing power.

A Federal Program to Meet Health Needs

American workers desire first-rate medical care at a reasonable cost. They want help in keeping well, prompt and good care if symptoms develop, and comprehensive insurance against the cost of medical expenses, both in short and long periods of illness.

That is why the CIO has for years supported a national program of health insurance and improved health services.

Americans naturally turn to their government to help them achieve their goals. More than a century ago they carried on a similar fight for public education against the opposition of those who thought that working men's children didn't deserve it. Fourteen years ago we secured passage of a national program of old age insurance, which has thoroughly proved its value although it needs to be extended and improved.

American workers know that the nation and their own earnings can support good medical care if the government promotes expansion of facilities and helps the people to pool the risk, contributing some funds from general revenues. CIO members are indignant at the continuing delay in enacting such a program.

Joe Worker and his family illustrate the typical situation in many wage earners' families. Joe is tired after many long years of work. Hours were long during the war, and working conditions were not of the best. He looks older than his years, even though he doesn't know what's wrong with him. Why waste money on going to the doctor, now that it is so hard to make ends meet?

His wife does go to the doctor—she has a pain in her back that she cannot seem to get rid of. Maybe a specialist would be able to help her more, but

Guernsey-Montgomery for the Economic Outlook, CIO.

she is afraid of expensive treatment. She gets along as best she can.

John, aged 12, is in good health. They do not have many worries about him, except trying to get enough meat and milk and bread to keep up with his appetite. Little Mary, aged 4, has not been so strong. They have made it a point to take her to the doctor regularly even though this has cost quite a bit. They have read the bulletins of the U. S. Children's Bureau about the importance of regular examinations, vitamins, and so forth. One of these days they are going to have to have her tonsils out, at quite a cost, but if that is the worst, they will be able to meet it.

There are many families much worse off than Joe Worker's. They have been overwhelmed by long-drawn-out illness which has cut off the father's income at the same time that huge bills have piled up. Their small savings have been spent for doctors' bills, and yet they have not been able to get as good care as needed. Many families live in smaller or poorer communities than Joe Worker, where there are few or no doctors.

There are plenty of statistics, for those who like them, to show the weaknesses of our present hazardous system of looking after the people's health.

Why should there be so many Americans in poor health? Well, the U. S. Public Health Service tried to answer that question by studying what happened in Hagerstown, Maryland, where they had been keeping track of the health of growing children for about twenty years. Most of the Hagerstown boys who were rejected for military service because of medical defects had those same defects when they were children. For example, three-quarters of the children who were rated as underweight and undernourished 15 years earlier were rejected by Selective Service. Half the children who were later disqualified because of eye defects had poor vision 15 years earlier.

What's the use of examining children, and writing down on a record what's wrong with them? Of course, the Public Health Service doctors hoped their parents would have those defects taken care of. But how? If they didn't have the money, how could they? Several studies have shown that people go into debt for medical reasons more than for any other reason.

That's why insurance against medical costs is so important. Illness often strikes individuals without warning, but for large groups of people, it is easy to predict how much sickness there will be, say, in a year. Then if every one in a large group regularly contributes a little to a common fund, each family unfortunate enough to be stricken with illness will be able to get the right kind of medical care when it is needed. The bigger you make the group, the less each individual has to pay because then you're spreading the risk more. That's why the government should create one big medical insurance system for everybody.

Private insurance companies do not offer a way out for American workers. Most of the group plans of the insurance companies pay back to subscribers not more than 70 cents out of each $1 paid in. More than 30 percent normally goes for administrative expenses, reserves and profits. Fees are too high and not graded according to income.

Some unions have filled in the gap with sickness insurance plans in wage agreements and have thus greatly helped their members. These plans generally provide cash benefits and payment of hospital and surgical bills. A few unions have also established medical centers for their members. But most of these union plans, like other voluntary plans, do not cover ordinary medical service, nor can they include an all-out attack on the nationwide problem.

Only a little over a third of our total population now have any kind of protection against medical or hospital costs under voluntary prepayment plans or through commercial insurance. Only two and one-half percent of the American people have insurance for comprehensive medical care, which in most cases is not as good as would be provided under national health insurance. Of the 50 million people who have some kind of medical or hospital insurance, half have protection only against hospitalization.

Many of the prepayment plans which provide physicians' services are very limited. For instance, most of the plans give you only surgical care in a hospital. If you have pneumonia, you have to bear the doctor's cost yourself.

The Blue Shield medical care plans sponsored by the medical societies are especially limited. They usually cover only surgical services, sometimes only in the hospital, and often for a short period. They do not take care of the expenses of going to the family physician for preventive treatment or simple illness. They won't admit old people and exclude ailments known to exist when a person joins.

Full cost of the covered services is met by the membership fees only for the lowest income groups. If a family's income exceeds a certain limit, only minimum charges are covered and the doctor can add whatever he wants in a separate bill to be paid by the patient. Many union members complain that as a result their bills run as high as before they got the so-called protection of a Blue Shield plan. The membership fees themselves run relatively high,

Guernsey-Montgomery for the Economic Outlook, CIO.

since the same amount is charged to everyone and since the administrative cost averages 17 percent.

The Basis for Good Health

If we want to make our people's health as good as it can and should be, there are many things that should be done. Some of these things can be done through union collective bargaining, and some need legislation.

Here are some of the basic improvements that have to be made:

Every family must have a decent level of living so that they can buy enough food, live in a good home and have warm enough clothes, plus recreation, vacations and other essentials that contribute to mental as well as physical well-being. The unions' drive for higher wages with prices kept at reasonable levels is a basic approach to improved health.

Efforts toward adequate housing, more playgrounds and similar programs are also essential. So, too, are other types of social security to provide incomes during unemployment, old age and in case of death of the wage earner. These programs need to be much improved if all workers are to be protected against these hazards and if the benefits are to assure health.

Working conditions must be improved and hours shortened to prevent overstrain, work accidents, slow or sudden poisoning that results in occupational disease, and so forth. The unions have long grappled with these evils through their shop committees and through legislation. But much still remains to be done.

Even with these basic improvements in levels of living and working conditions, there still would be sickness—not as much, but enough to cause a lot of trouble if you are not prepared for it.

People would still need good medical care. Families would still need an income while the worker was sick and unable to work. And the only way for everybody to be protected from the hardships brought on by disease and disablement is to have national legislation.

Essential Health Measures

Here are some of the protections a good national health program can give us:

1. Improved community action to provide modern hospitals, pure water, adequate sewage disposal, and to see that eating places are clean, that contagious diseases are isolated and cured, etc.

2. Greatly increased research to add to our power to cure and prevent disease. The miracles achieved through smallpox vaccination, diphtheria inoculation, the sulfa drugs and penicillin, must be repeated against other scourges—the common cold, cancer, heart disease, tuberculosis.

3. There must be a greatly increased emphasis on preventing disease and on checking it before it grows serious. Medical schools and doctors must stress prevention, and health insurance would help, since Joe Worker would not have to worry about

the cost involved in going to a doctor at the first sign of illness—or before, for regular check ups.

4. There must be increased health education so that the people understand how to prevent disease and why they should follow the doctor's directions. Here the public schools have an important job, which some of them are already performing very well.

5. The financial barriers to medical care must be removed by a system which makes medical services free or which, through an insurance fund, assures payment of doctors' fees no matter how much care may be required. Joe Worker and his family should be able to get care not only from their family doctor but from specialists when needed. They should be able to get the most up-to-date laboratory tests and treatments, and hospital care, or nursing care at home. Dental care, too, should be included, although it is a shocking fact that there are just not enough dentists to take care of all dental needs.

6. More doctors and nurses and laboratory technicians will be required, too, and the standards of the medical schools and of these professions will need to be raised. The doors of the medical schools must be opened to students on the basis of ability, and the outrageous discriminations on the basis of race or religion or sex must be removed. Hard-working doctors and dentists must be aided to keep up with the latest marvels of modern science, through scholarships that permit refresher courses, as well as through association with research centers. Development of group practice must be encouraged, since the wonders of modern medicine can best be made available where a number of doctors come together, as at the Mayo Clinic, to pool their specialized knowledge. Unfortunately, at present even when families have the money, they often have no way of selecting a good doctor and avoiding the overcharges and careless treatment that have done so much to harm the reputation of the medical profession.

7. When the breadwinner cannot work because of illness or accident, he must be assured of an income while he is laid up, so that his family does not suffer too much and so that he is relieved of worry about them. All too often a man goes on working when he has been told to stop, because he prefers to run a risk himself rather than have his children go hungry or have his family broken up.

Bills Before Congress

President Truman has called for a national health program which, though short of doing all that needs to be done, would mean a tremendous advance. Public opinion polls that have been taken in various parts of the country show that not only workers, but the majority of the people, want such a real national health program. But it is not going to be easy to get action by Congress.

This program has been presented to Congress in the form of a proposed National Health Insurance and Public Health Act. This bill would establish a national medical care insurance system, and provide federal funds to help the states strengthen their community-wide public health and maternal and child health programs, and pay for medical care for needy persons.

It would also improve the Hospital Construction Act, providing more federal funds to help states and localities build needed hospitals and public health centers, with relatively larger proportions going to the poorer states. Medical education and research would be aided so as to speed up scientific knowledge and the supply of qualified doctors, nurses, and other personnel. Medical cooperatives owned by consumers would be aided, especially in rural areas. So would union medical-service plans.

Some parts of the program were recommended by Congressional committees for action in 1949. The CIO is supporting these separate measures but hopes action will also be taken on health insurance. The latter encounters most opposition, but strong demand is needed for passage of any adequate health laws.

Cash disability benefits to provide an income for the families of workers who are sick or permanently disabled were included in 1949 in an Administration bill to improve old age and survivors insurance. Important medical care provisions for needy persons were similarly included as a transition step in a bill to strengthen public assistance. All these are essential to an adequate health program.

How Families Would Benefit

If the National Health Insurance and Public Health Act becomes law, here is how it would affect Joe Worker and his family. Joe would not have to hesitate to go to the doctor because of the expense involved. The doctor would send the bill not to him but to the insurance fund which would pay it out of money contributed by Joe and his employer and the government. Just how the fund would be built up has not yet been decided. The experts estimate that between 3 and 4 cents would be needed for every dollar paid in wages by Joe's employer. Joe might contribute 1 or 1½ cents for each dollar he earns, and his employer might pay an additional 1 or 1½ cents, with the rest coming from government. This may seem like a large sum but it is actually less than workers' families now spend on the average for far less medical care.

Economic Outlook, CIO.

If Joe makes about $3,000 a year, he would contribute $30 or $45 a year for medical care insurance. For that money, Joe, his wife and two children, and his parents, if they are living with or supported by him, could have all the doctors' and specialists' services they need, some dental care, a large amount of hospital care, and laboratory tests and expensive drugs.

Joe would get a card (everybody would get the same kind of card) saying he and his family were entitled to medical benefits from the insurance system for the year. He could choose any doctor he wanted; his wife or children could have the same or a different doctor.

If Joe needed medical care because of an injury or illness that was covered by workmen's compensation, he would get that care under the workmen's compensation program. But the workmen's compensation agency could arrange to have medical care for work accidents provided through the health insurance system, so that, in every state, Joe could go to his own doctor or any doctor he chose, for such care too.

If any of the family had a serious illness, the insurance fund would protect them from a severe financial drain. Hospital care would be provided for at least 60 days, and longer as funds and facilities permit. Hospitalization for tuberculosis and mental diseases would be provided for not more than 30 days, because there are already special arrangements for long-continued care for persons with these diseases, financed from general revenues.

If Joe's union has a medical-service plan, it would continue to function, and its costs would be met out of the national insurance fund.

Joe's family would benefit from the improved medical care that would result from the grants for research and the provision for fellowships for doctors, to keep them up to date on medical developments. A greater number of well-trained doctors and other personnel would become available. The states would be helped to develop more effective methods for many public health activities, especially in rural and economically depressed areas.

Doctors Also Gain

Doctors, dentists, hospitals, nurses and laboratory technicians would also benefit from the legislation, by being relieved of the bother of collecting bills. They would be sure of getting paid even if their patients were hard up. They would know that Joe Worker and all his friends could choose which doctor to go to. Doctors would continue to have the right to refuse service to those they did not wish to treat.

All doctors and dentists and nurses who have licenses to practice in a state are guaranteed the right to practice under the insurance system. Doctors could be paid either so much per visit (called fee-for-service), or so much a month or year, for each person on their list of patients; or they could be paid a full-time or part-time salary; or some combination of these methods. The doctors in each community would decide by majority vote on the method of payment for their services, but individuals who preferred another method could also arrange to be paid as they wished. Doctors could run offices by themselves or join in group practice.

The bill actually gives the doctors a great deal to

say about the whole program. Doctors and other professional people would help set standards for service. There is some danger, indeed, that the doctors would have too much control over the program and that the patients would not be heard sufficiently on administrative matters. To help prevent this, there is provision for national and local advisory committees on which representatives of the public, as well as the doctors, are included. There are also to be appeals bodies to hear complaints from anyone who feels he has a grievance, whether patient, doctor or hospital.

Why a National System?

The program would be nation-wide so that Joe Worker's family would be covered whether or not he moved to another state. A national system is better than state systems because it gives this coverage and because it helps bring adequate and modern medical care to people throughout the nation.

Health is not a local or state problem primarily. Germs work in the same way in the south or north, and they don't pay any attention to state lines. Epidemics sweep the nation and the world, and must be fought by the same methods in the east or west.

Only the national government can plan effectively for efficient development and use of medical facilities. It needs the cooperation of the states, but it must not abdicate to them.

With a national system, a worker who lived near a state border could go to a doctor in a community across the state line, if that were more convenient or he liked the doctor better than any in his home town. If he really needed it, Joe Worker could get special care and treatment anywhere in the country that there was a doctor or a hospital well equipped to give such treatment.

At the same time, this program would make it possible for doctors everywhere in the United States, not just in a few big cities, to keep up to date with improvements. The poorer states need the most medical care, yet have the fewest hospitals and doctors. With a national system of insurance, doctors, nurses, and dentists, even in the poorer states, could make a good living, have modern hospitals, and keep on learning. In time, the quality and quantity of medical care any worker could get for himself and his family would not depend on where he lived or what he could pay—but only on whether he needed it.

A national system costs less than separate state systems. And if we don't have a national system, we're not likely to have much of a program. A few states might act, but most wouldn't or couldn't. Each state will be afraid of putting its employers at a disadvantage as compared to employers in other states; and so they won't want to ask employees to contribute to the insurance fund.

Experience with unemployment compensation, where the federal government sees that all the states have programs, but where the states set standards for benefits and disqualifications, has shown workers the difficulties, inadequacies, and confusion of state systems.

That doesn't mean there won't be really local administration. The bill provides that there must be local advisory committees in every community; workers would be represented on these committees and could advise on running the program.

Why should we glorify the virtues of state government as it now exists in this country? There is nothing magic that makes state government more responsive to the needs of the people than is Congress in Washington. The U. S. Conference of Mayors has spoken forcefully of the fact that in most states city people cannot meet their problems effectively because the state governments are too much influenced by representatives of rural areas. CIO state industrial union councils are continually confronted with difficulties in securing necessary labor legislation because industrial areas are so under-represented. To quote a publication of the Mayors' Conference:

> "But in our state legislatures today we do not have equality of representation! Fifty-nine percent of the people of this country elect only 25 percent of the state legislators!
>
> "Who are the second-class citizens in this under-represented majority? They are the 84,000,000 people who live in our towns and cities. 59% = 25% is bad arithmetic—and bad government. It hurts not just city dwellers, but everybody."

Doctors For and Against

Many doctors are enthusiastically supporting the proposed National Health Insurance and Public Health Act and are working hard for it through such organizations as the Physicians' Forum. Unfortunately, the American Medical Association is under the control of the more conservative groups who have usually opposed any change in the tradition of medical practice. For example, the AMA fought bitterly against cooperatives to furnish medical care, such as Group Health in Washington. The District of Columbia Medical Society went so far as to refuse membership to doctors on the staff of

Economic Outlook, CIO.

Group Health, and got hospitals to refuse to take Group Health doctors and patients. It required a lawsuit and favorable action by the U. S. Supreme Court to force a change.

The American Medical Association is spending millions of dollars to fight health insurance. It is spreading highly misleading literature about the proposal and has tried to give the impression that doctors would lose the right to take or reject patients and the right to practice as they think best. Doctors are being deluged with literature for themselves and to hand out to their patients, and drug stores are given leaflets to distribute to customers.

Private insurance companies and patent medicine makers, who profit from present poor arrangements, are also fighting bitterly against the Truman health program.

To some extent, the American Medical Association has changed its tactics. It is setting up its own voluntary health insurance plans in many parts of the country. However, these plans cannot meet the basic needs of the people, as shown earlier.

The Taft Charity Dodge

Senator Taft and some other Senators have proposed bills that would pay for medical care only for needy persons. Such proposals would require a means test or paupers' oath, which are repulsive to American workers. The bills also miss the main point of labor's interest in health insurance. We want it not just for the poorest people but for all wage-earners. Workers with relatively good incomes need a national system to give them broad protection and good medical care at reasonable cost. And they don't want to see the program shattered among the states so workers are lost in a medical maze.

Other complicated bills and plans have been proposed that would likewise sacrifice the program to the cry of states' rights, even though avoiding the evil of the means test. One bill would pile up a vast confusion of competing plans aided by federal funds but dependent on changes in present state laws and on regulations drawn up by the states. The program would be costly because of duplication. It would require extensive regulations since federal funds would be used to pay costs of private associations. It would fail of its goal because the individual would be forced to choose among a bewildering array of plans, many of them inadequate and most needlessly expensive. Millions would as a result remain unprotected.

A Chance for Action

Only widespread popular demand can force action of even a mild kind by the present Congress. Although the various health bills have many strong supporters in Congress, many congressmen seem indifferent or hostile. The national health program is likely to become one of the issues in the 1950 elections.

It is possible that this Congress may do something to provide aid for medical education, research, and more hospital construction and community health activities. Such action would make health insurance all the more necessary, since only through health insurance will most people be able to use the new facilities and pay for the services of additional doctors and nurses and other medical personnel.

The real fight on the health program, with the forces that don't want change and don't want better conditions for ordinary people, centers around medical care insurance. The people must make it clear to their representatives that they want an adequate national health insurance program, and that they are going to keep pushing until they have the kind of health program that is needed for themselves and their children and the nation.

the press says . . .

NEW YORK TIMES

"Mr. Baruch urges . . . 'a complete national health program.' As usual, his prescription, applied this time to better medical care, carries in it the valuable ingredients of wisdom and experience."

TIME

"Last week (Bernard Baruch) talked like a Dutch uncle to a Manhattan gathering of 600 medicos and hospital administrators. It is high time, he said, that doctors give up their stiff-necked opposition to compulsory health insurance."

ST. LOUIS POST-DISPATCH

"How can any reasonable man of medicine object . . . to bringing medicine wherever there is the need instead of bringing it only where there is the money?"

OMAHA EVENING WORLD-HERALD

". . . Something should be done about the little people who live in dread of an illness they cannot afford to have."

LOUISVILLE COURIER-JOURNAL

"It is everybody's business. Health is not a copyrighted product, it is a right."

PITTSBURGH POST-GAZETTE

"It is not unreasonable to expect the medical profession to cooperate fully with Government in the adoption of a satisfactory program along the lines proposed by President Truman and Mr. Baruch."

SALT LAKE CITY DESERET NEWS

"Of (newspaper editors) commenting, a large majority favor the plan."

ALLY ILLEGIBLE

IS THERE A NEED FOR A NATIONAL HEALTH INSURANCE PROGRAM?

Two out of three Americans cannot afford adequate medical care. From a report of the American Medical Association.

The President of the United States declared "National health insurance is the most effective way to meet the nation's health needs."

Governor Dewey's Commission on Medical Care reported that a majority of the people of New York State favor a governmental health insurance plan.

Prominent citizens and doctors favor national health insurance. Including:

DAVID SARNOFF	CHANNING FROTHINGHAM, M.D.
GERARD SWOPE	ALLEN M. BUTLER, M.D.
BARRY BINGHAM	ERNST P. BOAS, M.D.
JONATHAN DANIELS	THOMAS G. ADDIS, M.D.

MRS. GARDNER COWLES

INFORMATION PLEASE
ON NATIONAL HEALTH INSURANCE

What medical services would I obtain?

Family physicians	Laboratory
Specialists	X-Ray
Hospital Care	Expensive Medicines, etc.

Could I Choose My Own Doctor And Hospital?

Yes. You have free choice of all doctors and institutions that serve under the act.

Must Doctors Serve Under the Act?

No. Not if they don't wish to.

What if I Belong to a Voluntary Health Plan?

These plans could continue. They would be reimbursed by the health insurance fund.

Where Can I Get More Information?

Write
THE COMMITTEE FOR THE NATION'S HEALTH
1790 BROADWAY
NEW YORK 19, N. Y.

15- Health

FACT SHEET No. 1

DO THE PEOPLE OF THE UNITED STATES NEED A NATIONAL HEALTH INSURANCE PROGRAM?

I. HOW MANY PEOPLE IN THE UNITED STATES NEED HELP TO MEET THE COST OF SERIOUS ILLNESS?

A. Four people out of every five, approximately 117,824,000 Americans, need help to meet the cost of serious illness. (1)

II. HOW OFTEN ARE PEOPLE ILL?

A. Among each 1,000 persons, during a normal year: (2)

1 out of 3 will be sick once
1 out of 7 will be sick twice
1 out of 20 will be sick three times

In addition, many more will suffer unrecognized illnesses, such as heart diseases or cancer in the early stages, so that over half the people in the country are sick at least once during the year. (2)

B. At least 7,000,000 people in the United States are disabled by sickness or other disability in any 24-hour period, half of them for six months or more. (3)

1. One person out of every 20 is afflicted by sickness or disability in any 24-hour period.

III. HOW MANY ACTIVE NON-FEDERAL-GOVERNMENT PHYSICIANS ARE THERE IN THE UNITED STATES?

A. There were 167,459 active non-Federal-Government physicians as of February 15, 1948, including 45,000 who limit their practise to a speciality. Of the remainder 99,572 are general practitioners; 18,487 are hospital interns and RESIDENTS; 4,400 are employed by insurance companies, industrial firms, etc. (4)

IV. IS THERE A SHORTAGE OF DOCTORS IN THE UNITED STATES?

A. Yes. There is a 25% shortage, (5) taking a standard of one active non-Federal-Government physician for every 667 potential patients. (1)

1. There would be only one active non-Federal-Government physician for every 884 potential patients, (4) as against a recognized standard of one for every 667, (1) if doctors were distributed evenly across the country.

2. However, there is less than one active physician for every 3,000 people in 10% of the nation's 3,070 counties; and 75 counties have no active doctor at all. (6)
3. Medical schools would have to double their present training capacities immediately to attain, by 1960, the standard of 1 physician for every 667 persons throught the nation.

V. HOW MANY HOSPITALS AND HOSPITAL BEDS ARE THERE IN THE UNITED STATES?

A. There were 1,468,714 hospital beds in 6,280 hospitals in 1946.(7)
   1. However, there is no approved general hospital in 41% of the nation's counties, with a total population of 15,000,000 people; (3) and 48% of our counties have less than the recognized standard of 4.5 beds for every 1,000 people. (8)

VI. HOW MUCH DO ILLNESS AND DEATH COST THE PEOPLE OF THE UNITED STATES?

A. About $27,000,000,000 a year. This is the estimated total hidden cost of sickness and disability, wage loss to workers and cost to business. (1)

B. In terms of production, loss is about 1,500,000,000 man-days annually. (1)

C. It is estimated that the people of the United States spent $5,600,000,000 in 1946 for medical care, including supplies and insurance. (9)
   1. In contrast with this, we spent $8,800,000,000 in 1946 for alcoholic beverages (9) -- 57% more for alcoholic beverages than for every form of medical care, including supplies and insurance!

VII. HOW MUCH DO WE SPEND FOR RESEARCH FOR NEW TREATMENTS AND CURES TO SAVE OURSELVES FROM DEATH AND DISABILITY?

A. It is estimated that about $28,000,000 is being spent from Federal sources, for research and development in medical and allied sciences. (10)
   1. In contrast with this, approximately $450,000,000 is being spent each year for industrial research. (11)
   2. Congress appropriated $29,866,200 for the Department of Agriculture alone in 1947, for research in the control and cure of plant and animal diseases. (12)

VIII. WOULD A NATIONAL HEALTH INSURANCE PROGRAM COST THE PEOPLE OF THE UNITED STATES MORE THAN THEY SPEND AT PRESENT FOR MEDICAL CARE?

A. The proposed Health Insurance program would cost the people less, on the average, than they spend at present, as shown by the following table: (13)

Annual Earnings	Estimated Present Expenditures (13)	Proposed Bill: 3% of Earnings ($1\frac{1}{2}$% paid by Employee, $1\frac{1}{2}$% by employer)	
$1250	$ 43.00	$18.75	$18.75
2500	74.00	37.50	37.50
3600	143.00	54.00	54.00

IX. HOW MANY PEOPLE IN THE UNITED STATES ARE NOT COVERED BY ANY FORM OF HEALTH INSURANCE?

A. At least 105,000,000 people are NOT covered by any sort of medical insurance plan. (14)

X. HOW MANY PEOPLE ARE COVERED BY VOLUNTARY HEALTH INSURANCE PLANS?

A. Only about 45,000,000 people in the United States have any sort of health insurance. (These figures probably involve considerable overlapping of coverage.) (1)

B. Only about 3,500,000 people were covered by comprehensive medical care plans. (14)

C. After about 14 years, only about 26,444,833 people, about 18% of the people in the United States, were covered by Blue Cross hospitalization plans as of July 1, 1946. (15)

1. It would take 27 years to enroll all the people of the country in Blue Cross plans, if the highest annual rate of enrollment to date were to continue. (16)
2. Only about 20% of all admissions to general hospitals in 1945 were covered by Blue Cross. (17)
3. Of all new patients in New York City hospitals in 1946, both in-patients and out-patients, more than half were treated at less than cost; less than 17% occupied private rooms and paid all expenses. (18)

XI. WHAT DO PUBLIC OPINION POLLS SHOW ABOUT POPULAR DEMAND FOR HEALTH INSURANCE?

A. In a national poll in 1944: (19)

82% thought something should be done to make it easier for people to get medical care.

85% thought Social Security should include doctor and hospital care.

58% were willing to pay a $2\frac{1}{2}$% payroll deduction to provide the money.

(The proponents of the present bills suggest only $1\frac{1}{2}$% deduction)

HOW A NATIONAL HEALTH PROGRAM WOULD SERVE THE SOUTH

Prepared by

Committee on Research In Medical Economics

1790 Broadway
New York 19, New York

Michael M. Davis, Ph.D., Chairman

Southern States spend as much, and often more, for public health, education and other public programs, than do the wealthiest states of the nation, in proportion to their per capita incomes. The Southern States have striven, and are striving mightly, to help themselves, particularly in the field of health. However, such state programs are limited by state incomes, so that the sums alloted to health, proportionately great as they are, are totally inadequate to meet the region's health needs. These facts will be revealed in Part I of the following study. The kind of national effort needed to solve, not only this region's health problems, but the rest of the country's as well, will be described in Part II in its special bearing on the South. In Part III, the statistics of health medical manpower and facilities are given for each Southern State.

Part I

Southern Health Needs and Resources

WEALTH EQUALS HEALTH

Per capita income, the clearest index of a region's wealth, correlates with surprising accuracy with almost any selected index of a region's health. Accompanying statistical data in Part III of this study will show an almost uniform relationship between the number of doctors and hospital beds to population in a given state and the state's rating in per capita income. Approximately the same ratio is reflected in relationships of dentists to population, infant mortality rate, hospital days per capita and other health indices included herein.

LOW INCOME EQUALS POOR HEALTH

One of every two Southern youth - in the prime of life - was unable to meet the minimum physical or mental requirements for military service. These rejections included educational as well as health deficiencies. The rest of the nation furnished 65 eligible soldiers from every 100 men examined. The Southern States averaged only 49.6, a 40% increase of rejectees in the South.

In North Carolina, a state which made one of the poorest showings in draftee rejection rates, a surprising discovery was made. The rejection rate of North Carolina as a whole was 57%, whereas "among draftees who had grown up in North Carolina orphanages and who had not-too-expensive hospital and medical care plus sound but-not-expensive nutrition, the rejection rate had been only 3%!" (1)

Unnecessary death, misery and ill health are revealed clearly in the infant and maternal mortality rates in the South. These figures can be directly linked to desperate shortages of medical personnel and facilities. The reason that nine of the ten states with the highest maternal death rate were Southern States is easily seen in the statistics which show that only five out of ten Southern mothers are able to afford and have available, the protection they need in childbirth, compared to almost nine out of ten outside of the South. Of fourteen states with the least number of hospital beds per population, eleven of them are Southern States.

SOUTH - RECOGNIZING ITS NEEDS - ACTS

Southern States have been among the first in the nation to recognize their own health needs and to take advantage of the provisions

of the Hill-Burton Hospital Construction Act. Mississippi, which ranks 48th in the number of hospital beds per 1,000 population, was the first state to be awarded a contract for the building of a hospital under the Hill-Burton Act. Fielding Wright, the Governor of Mississippi, has said, "Mississippians have long recognized the great health need of better hospital care. We are seeing our plans come true under the great statewide hospital building program now under way."

In 1945 the Mississippi legislature appropriated $5,000,000 to supplement the Federal grants, for the first two years of a long range hospital construction program with the ultimate goal of 4 hospital beds per 1,000 population.

But even such state actions are not an answer to the health dilemma unless the people can afford to pay for the use of those hospital beds once they are in existence.

THE SOUTH'S RURAL PROBLEM

Within the over-all health levels of the Southern States, are records of rural areas revealing even greater disparities and needs. The majority of the population of the Southern States live in rural areas - as much as 77.8 per cent of the population in Arkansas and 80.2 per cent in Mississippi.

> "The medical care problem in North Carolina is to a large degree a rural problem. Nearly three-fourths of our State's population live in open country areas or in towns of less than 2,500 population. The income, particularly

the cash income, of our rural people is relatively low as compared with urban population. Rural people are relatively isolated from hospitals and towns where most of the physicians live." (1)

"The number of general physicians practicing in rural areas, or among rural people, becomes distressingly smaller every year." (I)

"As older rural physicians retire or die, few young physicians move in to take their places." (1)

"The tendency of young physicians to specialize accentuates the rural problem." (1)

"In the poorer rural counties and communities, the shortage of physicians is much more critical than in the richer urban counties and communities." (1)

"The distribution of physicians within counties is just as unbalanced." (1)

"There is also a poor distribution of physicians by race." (1)

A study of the data in Part III, covering all the Southern States, reveals that a large part of the Southern health problem is a rural health problem.

THE SOUTH CAN'T DO IT ALONE

"The individual's inability to pay for needed care has serious effects on the local community and on the state.....where the per

capita income level is low there are fewer personnel, and fewer services are received. Within the states, the deficits are even more marked. . . lack of group purchasing power also makes it extremely difficult to increase such basic resources as manpower and facilities. No matter how humanitarian their purpose physicians, by and large, cannot respond merely to the need of the people. That need must be backed up by enough stable purchasing power to assure the doctor or other health worker an adequate income. What is true of doctors is equally the case with medical colleges, training schools and teaching hospitals." (2)

Since the South's health problem is mainly an economic problem, a problem of the individual's and family's purchasing power for medical care, the solution is to put purchasing power for medical care into their hands. Such a solution is offered in National Health Insurance--a national solution which would particularly benefit low income areas in the nation.

PART II

PRESIDENT TRUMAN'S NATIONAL HEALTH PROGRAM

The President's program as presented in several messages to Congress includes, A. national health insurance, and B. aid to the states to increase and improve medical manpower, hospitals, research, public health services and professional education.

National Health Insurance

(For description of Bill S.5 - HR 783, see Appendix)

SPECIAL BENEFITS FOR THE SOUTH

1. Sickness costs would be spread over the nation as a whole, and the allocation of the national health insurance fund to the states would be such as to increase the amount of money available, in the poorer states, to pay for physicians and hospital services. The money would actually be spent by the states and localities.

2. Purchasing power for medical care of middle and low income families would therefore be increased.

3. Doctors would therefore be attracted to many towns and rural areas from which they have been kept away by the low paying-power of the people.

4. Hospitals could be maintained in such areas, because they would be insured payment from the health insurance fund for the cost of the treatment they furnished insured persons and their families.

5. Because the South has an especially large number of low income families, the South would derive particular benefits.

6. People would feel free to consult their doctors early in the course of a disease instead of waiting until it became serious. They would be able to go to their doctors for check-ups, even though they were not sick. These preventive measures reduce disability of workers and lessen the costs of ill health.

7. Doctors would be free to prescribe whatever their patients need in the way of laboratory tests, x-rays, expensive medicines, and consultations with specialists. Today, doctors are often unable to do their best for their patients because they know their patients cannot afford the cost.

8. The South would be benefitted by the special provisions for rural areas which are included in the national health insurance bill. Any state would be empowered to use part of the health insurance fund to assist localities to provide such services as ambulances, travel expenses for patients and for physicians, nurses, dentists and other professional workers. The plan also would provide for scholarships for rural students to go to medical college or other professional schools and would assist them in settling in areas that served rural people. Income subsidies and guarantees could be obtained by rural areas, where necessary, to recruit and to maintain adequate personnel.

Aid To The States

MORE MEDICAL MANPOWER

President Truman's program includes provision of federal aid to give scholarships to medical students and "...to expand medical colleges, training schools and teaching hospitals, and to establish new ones until, by 1960, our annual production of medical manpower in all categories has increased by 40 to 50 per cent." (2)

On a succeeding page (p. 12) there are printed the standards of medical personnel and hospital facilities needed for adequate service. These standards can be compared with the actual number of physicians in proportion to the population found in each Southern State, as published in Part III. As will be seen from this comparison, the South is low in physicians, dentists, and hospital beds and would, therefore, benefit especially by such measures as the President proposes.

Federal aid for scientific research is also included in the national health program.

MORE HOSPITAL FACILITIES

In the report of Mr. Oscar R. Ewing, Federal Security Administrator, made to the President in September 1948, the needs for additional hospital beds are set forth as follows:

> "To double the number of acceptable hospital beds as rapidly as possible, certainly within 15 years, and, at the least by 1960, to have added 600,000 beds to our hospitals, and built such additional health centers and auxiliary facilities as state-by-state surveys have shown to be necessary throughout the country.
>
> "This can be accomplished (1) by doubling present building under the Hospital Construction Act for the next 3 years and, after that, by increasing appropriations progressively so that the required total is reached; (2) further, by increasing in 1949 the percentage of the Federal contributions and by encouraging the states to make sufficient contributions, so that impoverished areas, which also are the areas of greatest need, will be able to finance their smaller share of total costs; (3) further, by assuring partial Federal financing of operation and maintenance, beginning in 1949, so that inadequate income will no longer constitute a barrier to building hospitals in areas of greatest need." (2)

The South has ~~less~~ fewer hospitals and higher sickness rates than any other region of this country. It would normally be assumed that what facilities and personnel the South does have would be used to maximum capacity. This is not true. Its hospital occupancy rates are actually lower than those elsewhere because of its peoples' inability to pay for these services. The South would not only get more desperately needed hospitals under the President's Health program, but the ability to maintain these hospitals through National Health Insurance.

BETTER SANITATION

A 1946 U. S. Public Health Service survey of sanitation needs

revealed great needs for sewerage disposal systems, water works and especially rural sanitation facilities throughout the nation. The report said, "In general it is in the rural areas that water and waste disposal facilities are least satisfactory." Of existing facilities, it said, "On the basis of bacteriological and chemical tests and sanitary surveys of large numbers of individual water supplies by several State health departments, it has been found that more than 75 per cent of these supplies are unsafe....There is a clear relationship between these unsanitary conditions and the fact that our highest death rates from diarrhea, dysentery and typhoid fever are in areas not served by public water supplies or sewers."

"The task of providing the necessary sanitation facilities to protect the health of the people at present devolves almost exclusively on local communities and states; in the case of rural sanitation, largely upon individual home owners. The greatest needs are in the smaller communities, which will be least able to meet the costs of adequate sanitation. This is clearly a situation in which the State and Federal Governments have a fundamental interest.

"The Eightieth Congress recognized part of the Federal responsibility by enacting Public Law No. 845, which provides for loans to local governments - $22,500,000 a year for each of five years - to assist in building treatment plants to reduce the pollution of rivers and streams ... In the future, certainly by 1960, loans and grants for elimination of water pollution, for garbage disposal, and for rural sanitation should total about $400,000,000 a year." (2)

BETTER CARE FOR THE INDIGENT

People who have no incomes and who are wholly dependent upon charity for their support are usually the responsibility of local or state public welfare departments. Such persons cannot, of course, belong to a health insurance plan which requires contributions from earnings.

Under the national health insurance bill, all persons earning as much as $150 in a year would be eligible to receive service. For people who are below this level of earnings, or who have no incomes at all, the national health insurance bill permits state or local welfare departments to bring such persons and their families into the national health insurance system by paying the required amounts of money in behalf of these persons into the health insurance fund. Generally speaking, this would cost the states and localities less than to provide adequate medical care for these same persons by direct local governments.

MEDICAL CARE UNDER THE SOCIAL SECURITY ACT

Under the existing Social Security law, contributions from federal funds are made to the states for aged persons in receipt of old age assistance, for dependent blind persons, and for dependent children. The federal contributions are, however, restricted with respect to their use for medical care.

Furthermore, there is no provision in the present Social Security law for aid to the states--particularly the poorer states--for medical care for any but the three categories of people just named. President Truman proposes that federal aid be extended so that the poorer states

would have special help in providing medical care for indigent persons besides the three categories--the aged, the blind, and dependent children.

This extension of social security would be of especial value to the Southern States.

HOW A NATIONAL HEALTH PROGRAM WOULD SERVE THE SOUTH

Part III

Standard Of Medical Personnel And Facilities Needed To Provide Adequate Medical Care

REALISTIC STANDARD BASED ON EXPERIENCE

An acceptable and realistic standard of medical manpower can be based on the records of our twelve top states in this respect - on the levels of manpower which they have already achieved. The standards given here are an average of the top quarter of our states.

PHYSICIANS

1 physician for every 667 persons.

DENTISTS

1 dentist for every 1400 persons.

HOSPITALS

The basic standard for the number of general hospital beds per 1,000 population is based on the standard set up by the states under the Hospital Construction Act.

4.5 general hospital beds for every 1,000 persons.

COMPARISON

It is interesting to compare the statistics for the Southern States with the above standards for providing adequate medical care.

HOW A NATIONAL HEALTH PROGRAM WOULD SERVE THE SOUTH

Part III

ALABAMA

How Alabama Ranks Among All States (1)

Per capita income, 1946	46th
Gen. hospital beds per 1,000 pop. 1946	47th
Days of hospital care per capita, 1946 (2)	47th
Number of persons per physician, 1940	48th
Number of persons per dentist, 1940	46th
Per cent of births in hospitals, 1946	48th
Infant deaths per 1,000 live births, 1946	36th
Maternal deaths per 1,000 live births, 1946	45th

Health Services and Records — Comparison

	Alabama	N. Y.	Minn.	Wash.
Per capita income, 1946	$ 733	$1,633	$1,090	$1,346
Genl hospital beds per 1,000 pop., 1946 (2)	2.2	4.8	4.5	3.9
Days hospital care per capita, 1946 (2)	.49	1.42	1.34	1.11
Number of persons per physician, 1940	1,365	496	792	790
Number of persons per dentist, 1940	4,683	1,314	1,344	1,376
Per cent of births in hospitals, 1946	49.2	96.9	95.2	98.2
Infant deaths per 1,000 live births, 1946	37.9	29.1	28.6	33.4
Maternal deaths per 1,000 live births, 1946	2.6	1.2	.9	1.1

Availability of Medical Care in Rural Alabama

		U.S. Average (All Counties)
A. Gen. hospital beds per 1,000 pop. in counties with largest urban place under 10,000 pop., 1942	0.8	3.5
B. Number of persons per effective (3) physician in rural counties with no urban place, 1940	2,797	876

69.8 percent of the population of Alabama live in rural areas as defined by the U. S. Bureau of the Census, i.e. population with residence in open country or in communities of less than 2,500. In "A" above are included counties with urban places up to 10,000 population; those in "B" are counties with no urban place at all. Both "A" and "B" are areas which are "isolated", i.e. do not even border on any county with a large city. The figures given for both "A" and "B" areas show the availability of hospitals and of physicians to be far below standard.

(1) District of Columbia included
(2) Federal Hospitals excluded.
(3) Practicing physicians over 65 years of age counted as 1/3 effective

APPENDIX

WHAT IS NATIONAL HEALTH INSURANCE?

The National Health Bill (S.5 and HR 783) would provide health insurance for people regardless of residence, race, creed or color. About eighty-five per cent of the population would be covered, self-employed persons being included along with salaried workers and wage-earners and their families.

People would be entitled to full services from physicians, both general practitioners and specialists, hospital care, laboratory service, x-rays, expensive prescribed medicines, eye-glasses and special appliances. Limited dental and home nursing service are included.

There would be free choice of physician or dentist and freedom to change one's choice. Physicians and dentists would be free to participate in the health insurance system, or not, as they desire. They could continue to have private-practice patients. They would be free to accept or reject patients, as they are now.

Physicians would not be employees of government, but as individuals, or through medical groups or medical societies would make contracts with the health insurance agency or the locality or the state, to serve insured persons.

These guarantees apply to organized groups of practitioners, clinics, consumer cooperatives and similar health service plans as well as to individuals. Every hospital that participates is guaranteed freedom from governmental supervision or control.

Physicians would be paid according to a method to be chosen by a majority of physicians in any given area: on a fee-for-service,

salary, or capitation basis; or by any combination of these methods. Minority groups of physicians could negotiate the methods which they preferred.

The services would be financed mainly by payment of 1½% of earnings, by regular payroll deductions from employed persons, into the national health insurance fund, an equal amount to be paid by the employer. The 1½% is calculated on annual earnings only up to $4800. Supplementary appropriations to the fund might be made by Congress out of general revenues.

The present expenditures of American families for physicians and hospital services average 3% of income. Most of the money called for by national health insurance would not be a new expenditure.

Decentralized Administration Emphasized

The National Health Act (S.5 and HR 783) specifically states that the funds would be collected by the Federal Government along with other social security payments, and would be allocated to the states according to a method stated in the law. Each state government would work out a state plan of operation, would divide the state into local service areas and appoint local committees and officers. Doctors and lay citizens in the localities where the services are rendered and received would run the program.

The local set-up would consist either of a local administrative committee or of an administrative officer working with an advisory committee. Such local committees would include both lay and professional people, appointed by the state.

State and national advisory councils would have similar representation. On all levels purely professional matters come wholly under professional bodies.

The duties and powers of the Federal Government are limited to the collection of funds, their allocation to the states, and the maintenance of general standards.

FACTS ABOUT

THE NEED FOR NATIONAL HEALTH INSURANCE

1. HOW MANY AMERICANS CANNOT MEET SERIOUS SICKNESS COSTS WITHOUT ASSISTANCE?

Two out of every three persons - about 97,000,000. This number is based on the estimate of the American Medical Association in 1939 that families with incomes under $3,000 need help to meet the cost of serious illness.

2. WHAT DO SICKNESS AND DISABILITY COST ANNUALLY?

In terms of production - About 600 million man-days are lost annually.

In terms of money - - - About $8 billion annually - half in medical costs and half in lost earnings.

The total annual costs of sickness and disability, including direct wage losses, direct business costs, plus "hidden costs" of loss of future earnings because of premature death and disability, come to more than $15 billion.

3. HOW WOULD THE COST OF NATIONAL HEALTH INSURANCE COMPARE WITH PRESENT EXPENDITURES FOR MEDICAL CARE?

In 1946, over $5.6 billion were spent by the people of the United States for medical care, including medical and hospital services, medicines and supplies, and health and accident insurance. In 1941, the total amount spent on medical care was over $3.4 billion.

The amount spent for medical care by families varies with the various income levels.

August 1948

In 1941, the average family with a yearly income of $1,250 spent $43 for medical care.

In 1941, the average family with a yearly income of $2,500 spent $74 for medical care.

In 1941, the average family with a yearly income of $3,600 spent $143 for medical care.

(These figures exclude expenditures for dentistry and home nursing.)

The annual contribution proposed under National Health Insurance would be 3 per cent of earnings, but in the case of employed persons half of this would be paid by the employer. Thus:

An employee earning $1,250 yearly would contribute $18.75

An employee earning $2,500 yearly would contribute $37.50

An employee earning $3,600 yearly would contribute $54.00

Comparison with the above figures shows that the payments required of employed persons under National Health Insurance would be much less than these people spend at present for medical care.

4. DO AMERICANS WANT NATIONAL HEALTH INSURANCE?

A nationwide poll by the National Opinion Research Center in 1944 showed:

82% thought something should be done to help people pay for medical care.

85% thought Social Security should include doctor and hospital care.

58% were willing to pay a 2½% deduction for this care.

FIVE IMPORTANT FACTS ABOUT

THE NATIONAL HEALTH INSURANCE AND PUBLIC HEALTH ACT (S. 1320)

This health insurance bill is not socialized medicine. Socialized medicine means that doctors are employed by government. This bill (S. 1320) is a pay-as-you-go insurance program in the American way. It provides specifically that:

1. Patients have free choice of doctors. (1)
2. Doctors have free choice of patients. (1)
3. Doctors have free choice whether or not to serve under the National Health Insurance plan. (2)
4. Administration would be on the local level. (3) The bill provides that each state be sub-divided into local self-governing areas to insure home control. The majority of doctors in each area may determine for themselves the method of payment. It may be on the basis of a fee for each service, a salary, or a per capita fee (so much for each patient under a doctor's care), or a combination of these methods. (4) This definitely refutes the mis-statement that "a Washington bureau (would) pay all the doctors in the United States to give free medical service to all the people in the United States."
5. Medical care would be based on the insurance principle. This bill (S. 1320) provides insured persons with needed medical care as their right. (5) It is not tax-supported charity limited to those willing to admit they are "medically indigent."

==========

FACTS ABOUT THE

NATIONAL HEALTH INSURANCE AND PUBLIC HEALTH ACT (S. 1320)

1. WHAT IS THIS ACT?

Federal Bill (S.1320) would provide health insurance for our people regardless of residence, race, creed, color, or economic status. (p. 4)*

2. WHAT MEDICAL CARE WOULD I HAVE?

Preventive (check-ups, inoculations, etc. to keep you from getting sick unnecessarily); diagnostic (to find out what is wrong with you when you are sick); and curative (to cure you after you are sick).

This means services by a family physician, services of specialists when required, hospital care (60 days hospital care, except for tuberculosis and mental diseases); laboratory and x-ray services; unusually expensive medicines; special appliances and eyeglasses; dental care and home nursing to limited degree. (p. 5)

3. WILL I BE ELIGIBLE?

Yes, you and your dependents (wife or disabled husband parents, children if dependent and under 18 years of age), if you are:

a. employed or self-employed
b. receiving old age or survivors benefits
c. receiving civil service benefits
d. a needy person whose contributions to the insurance fund are paid by a public agency (pp. 13,60,61,65)

4. HOW MUCH WILL I HAVE TO PAY FOR THESE SERVICES?

1½% of your earnings up to $3,600; your employer would contribute another 1½% up to $3,600. If you are self-employed, you would pay 3% up to $3,600 of your own earnings. (pp.52,59)

---

* Page numbers refer to Bill S. 1320, 80th Congress, 1st Session.

5. WILL I HAVE FREE CHOICE OF DOCTOR AND HOSPITAL?

Yes, you can choose your own doctor, hospital, group clinic, specialist, dentist, or nurse from among all the practitioners and institutions in your community that serve under the Act. (p. 9)

6. WILL DOCTORS CHOOSE THEIR OWN PATIENTS?

Yes. Doctors will be free to accept or reject patients, just as they do now. (p. 9)

7. MUST DOCTORS SERVE UNDER THE ACT?

No, not if they do not wish to. By merely declaring he does not want to serve patients under the National Health Insurance Act, a doctor can remain outside of it. (p. 16)

8. WILL MY MEDICAL RECORDS BE OPEN TO PUBLIC INSPECTION?

No, of course not. Your medical records must be held confidential, just as doctors hold such information confidential now. Statistics may be compiled from the records, but the identity of any individual may not be revealed. (p. 44)

9. HOW WILL DOCTORS BE PAID?

They will be paid by the method a majority of the doctors in a given area or locality prefer. Doctors will be paid by a fee-for-each-service, by salary, or on a per capita (so much for each person on the doctor's list) basis; or by a combination of these methods, as the majority may determine. (p. 20)

10. WHAT HAPPENS IF I BELONG TO A VOLUNTARY HEALTH INSURANCE PLAN?

Voluntary health insurance plans could continue to provide you with services under this Act, and be reimbursed from the Health Insurance Fund. (p. 17)

11. HOW WILL THIS ACT HELP ME IF I LIVE IN A RURAL COMMUNITY?

You would have more doctors at your disposal. The Act will make it possible, through added financial aid from the Insurance fund, for more doctors to go to rural areas. It will also help to expand local public health services, rural hospitals, and ambulance service. (p. 68)

12. HOW WILL THIS ACT BE ADMINISTERED?

a. The funds will be collected by the Federal government along with other social security payments. (p. 51)

b. Each state government will divide the state into local service areas and appoint local committees and officers. (p. 34)

c. Doctors and laymen in the localities where the services are rendered and received will run the program. (p. 25)

d. The local set-up will consist either of a local administrative committee or of an administrative officer working with an advisory committee. Such local committees will include both lay and professional people, appointed by the State. (p. 26)

e. National and state advisory councils will have similar representation. (p. 42.)

f. At the Federal level, administration will be by a board (within the Federal Security Agency) of five fulltime officials. (p. 38)

13. HOW WILL THE HEALTH OF OUR COUNTRY BE IMPROVED?

a. (1) Everybody will be able to get preventive medical services to keep away sickness.

(2) You will get all physicians and hospital services when you are sick, without worry about expense. You pay as you go, a little every month, sick or well. When you get sick, you will have prepaid your doctor and hospital bills.

b. Doctors will be able to practice in rural and poor areas with assurance of adequate income.

c. There will be more money for more hospitals, needed now in many places.

d. There will be funds for grants-in-aid to proper agencies for medical research, for better treatments and cures.

e. Properly qualified persons will be able to get more and better professional training, ending the present shortage of doctors, nurses, and other medical workers. (pp. 57, 82)

****

14. IS THIS THE WAGNER-MURRAY-DINGELL-BILL?

The present National Health Insurance and Public Health Act has replaced the Wagner-Murray-Dingell Bill, and is an improved version of it with more sponsors.

15. WHO SPONSORS THE NATIONAL HEALTH INSURANCE ACT?

It is sponsored in the Senate by Senators Wagner, Murray, Pepper, Chavez, Taylor and McGrath, and was introduced on May 20, 1947. In the House it is sponsored by Representatives Dingell and Celler.

16. WHAT GROUPS TESTIFIED AGAINST THIS BILL?

The American Medical Association, allied medical and dental organizations, some hospital associations and a few insurance companies.

17. WHAT ARE THE GROUPS THAT TESTIFIED IN FAVOR OF THIS BILL?

The American Federation of Labor and the Congress of Industrial Organizations, along with many consumer, church, farm, cooperative and veteran organizations.

Also supporting the Act are two medical organizations -- The Physicians Forum and the Committee of Physicians for the Improvement of Medical Care.

1948

SOME STATEMENTS AND MISSTATEMENTS

ABOUT NATIONAL HEALTH INSURANCE

1. IS HEALTH INSURANCE "SOCIALIZED MEDICINE"?

OPPONENTS of National Health Insurance say:

"The proposals...are in reality State Medicine. If enacted into law and made fully effective, they would destroy the private practice of medicine and dentistry in the United States." (1)

"We are fully convinced that compulsory prepaid health insurance is definitely socialistic." (2)

THE TRUTH is:

President Truman in his message to Congress, November 19, 1945, said: "Everyone should have ready access to all necessary medical, hospital, and related services."

"I recommend solving the basic problem by distributing the costs through expansion of our existing compulsory social insurance system. This is not socialized medicine...Socialized medicine means that all doctors work as employees of government. The American people want no such system. No such system is here proposed." (3)

Elder statesman Bernard Baruch declared: "There is no question -- the need for more medical care exists...Nothing has been suggested so far, which promises success, other than some form of insurance covering these people by law and financed by the government, at least in part -- what some would call 'compulsory health insurance.'...

"It can be devised, adequately safeguarded, without involving what is termed 'socialized medicine.' I do not fear government taking its legitimate part in medicine, any more than I fear it in education or housing..." (4)

2. FREE CHOICE OF PHYSICIAN

OPPONENTS of Health Insurance say:

"The right of the Citizen to pick his own doctor will be wiped out." (5)

"There would be definite limitations in the free choice of physicians and specialists." (6)

THE TRUTH is:

The proposed Health Insurance Bill specifically assures the patient the right to choose and change his doctor. Actually the people would have freer choice than most of us have today, because choice of doctor will not be limited by inability to pay.

The words of the Bill are:

"Sec. 203, Every individual eligible for personal health services available under this title may freely select the physician, dentist, nurse, medical group, hospital or other person of his choice to render such services, and may change such selection." (7)

3. "BUREAUCRATIC CONTROL" OF DOCTORS

OPPONENTS of Health Insurance say:

"...doctors would be subject to bureaucratic control and would be responsible to non-medical persons. A system of bureaucracy would fasten itself to the medical profession like the old man of the sea and would impose all kinds of senseless rules and regulations." (8)

"...will subject to bureaucratic control and supervision the ultimate and confidential relationship between doctor and patient." (9)

"It makes mere political pawns of doctors, dentists, and nurses." (10)

THE TRUTH is:

The National Health Insurance Bill assures professional freedom to doctors. Their medical work is not to be subject to lay direction. Doctors are represented on all commissions and advisory councils. All purely medical matters are to be settled only by doctors.

U.S. Attorney General Thomas C. Clark gave the following opinion in a letter to Senator James E. Murray, May 14, 1946:

"I have found nothing in the legal construction of the proposed legislation which would operate to threaten the dignity of the doctor and patient relationship, lessen the desirable effectiveness of medical ethics, or in any way prove prejudicial to either the profession or the public." (11)

4. "BUREAUCRACY"

OPPONENTS of National Health Insurance say:

"It is also to be noted that in the experience of Europe, there will be an employee of the system, outside the field of the actual delivery of medical service for at least every one hundred persons insured." Thus in the United States (if there were 100 million people insured) there would be a million employees needed. (12)

THE TRUTH is:

This figure is a gross untruth. The number of administrative employees in the well-established European systems is about 1 to every two thousand insured persons. This would mean 50,000 employees if 100,000,000 people were covered by health insurance. (13) Only a small proportion of these government employees would be federal. Most would be local.

5. COST OF HEALTH INSURANCE

OPPONENTS of National Health Insurance say:

"From the beginning the cost of such a system (compulsory health insurance) would amount to between 7-8% of the worker's income...that would be a load of 7 billion by 1960." (14)

THE TRUTH is:

This figure confuses the cost of health insurance with the cost of all social security benefits (old age insurance, etc.).

The best estimates are about twelve billion dollars for the total social security program, including the present taxes, not in addition to them.

As for health insurance, the correct cost figure is 3%. This would mean between three and four billion dollars total, the amount varying, of course, with the wage scales and the amount of employment. This figure would about equal the present payments for physicians' and hospital care now made by our population. People are now spending an average of 3% of their income annually for the physicians' and hospital services which would be provided under the health insurance bill. Their health insurance payments would be a substitute for these present expenditures. (15)

6. ADMINISTRATIVE COSTS COMPARED

OPPONENTS of National Health Insurance say:

"Insurance companies can insure more efficiently than the government." (16)

"In no instance will the cost of such voluntary prepayment medical care approach the great cost which a Federal plan of socialized medicine or political medicine demand." (17)

THE TRUTH is:

These statements are exactly the reverse of the truth. The policies sold by private insurance companies to individuals pay back to the policy-holder an average of only fifty cents on the dollar, or less, for the premiums paid.

Policies sold to employed groups pay back a larger portion, but usually only between sixty and seventy-five cents for the premium dollar.

In other words, the best that insurance companies can do is to show an administrative cost, including profits, of at least 25%. One of the reasons for this high cost is the necessity of maintaining a sales force to get and keep business in competition with other companies.

Many non-profit voluntary insurance plans operate at a 12-15% ratio. Governmental plans which do not have to maintain any sales force, can operate at half this ratio, or less. The National Health Insurance Bill limits administrative costs to 6%. (18)

7. DOES HEALTH INSURANCE INCREASE SICKNESS?

OPPONENTS of National Health Insurance say:

The following quotation has been lifted out of text from the writings of an advocate of National Health Insurance and used as an argument against it:

"The most startling thing about insurance countries is the steady and fairly rapid increase in the number of days the average person is sick. In the United States, average recorded sickness per individual is seven to nine days a year. It is nearly twice that among the insured of Great Britain and Germany and has practically doubled in both countries since inauguration of insurance. It seems to be a safe conclusion that insurance has certainly not reduced sickness." (19)

THE TRUTH is:

It is not the days of sickness that increase. It is the days of treatment! Many illnesses had gone untreated formerly whereas under insurance they are given medical treatment in time, often preventing fatal consequences.

In these insurance systems the period for which benefits are given has been extended from time to time -- therefore it was inevitable that the number of recorded days of incapacity for which cash sick benefit was paid would increase, not because there was more sickness, but merely because cash benefit would be paid for a larger part of the period of illness and incapacity. (20)

8. COMPARATIVE DEATH RATES

OPPONENTS of Health Insurance say:

"Under the medical care now provided in the United States the highest level of health and the lowest death rate ever known under similar conditions are being maintained." (21)

"The Nation's Health problem is not grave, since the United States now (1943) has the lowest sickness and death rate of any large nation in the world." (22)

THE TRUTH is:

Death rates are not a very good measure of a nation's health, and these rates are often not exactly comparable for different countries. Therefore dogmatic statements like the above are not made by scientific people.

So far as the figures go, however, they show that the United States lags behind other countries in many health records.

We have to take statistics of pre-war years since figures during and since the war are either unavailable or not comparable.

In 1934-36 eighteen countries had lower death rates than the United States among persons in the prime of life (age 35-64), Australia, Austria, Belgium, Canada, Denmark, England, Germany, Ireland, Italy, Luxemburg, Netherlands, New Zealand, Northern Ireland, Norway, Scotland, Sweden, Switzerland, and Wales. (23)

Eight countries had lower death rates among children 1 to 4 years old: Austria, Denmark, Luxemburg, Netherlands, New Zealand, Norway, Sweden, and Switzerland. (23)

Seven countries had lower infant mortality rates than the United States: Australia, England and Wales, Netherlands, New Zealand, Norway, Sweden, and Switzerland. (23)

9. UNMET MEDICAL NEEDS

OPPONENTS of National Health Insurance say:

"Much has been said regarding medical neglect. In 30 years of surgical practice I have never encountered a person who suffered for lack of medical care except in a few instances where medical care was not sought or desired. There are very few places in this great country of ours where medical care is unavailable."

THE TRUTH is:

No physician can estimate the number of people who do not come to him when they need care. To find unmet medical needs, it is necessary to interview families themselves, find out what illnesses they have had, what medical care they had - or not had - and what they paid for it. Many thousand families have thus been studied in all parts of this country.

It has been found that among low-income groups from 1/5 to 1/4 of the people obtain no medical care even in illness serious enough to disable for a week or more.

It has been found that the amount of medical service which people obtain is closely proportionate to their incomes. The amount of service may be measured in the number of visits from or to a doctor. Among low income people ($1,000 a year or less), the average number of doctor-visits per year was 2 1/5. Among families with incomes of $3,000-$4,000, the number was 3.0, while among families having $10,000 or more a year the figure rose to 5 1/2.

Yet the amount of illness was less among the high-income people than among the poorer ones. (25)

10. SELECTIVE SERVICE FINDINGS

OPPONENTS of National Health Insurance say:

"Although 40% of our young men examined by Selective Service are rejected because of diseases or defects, this fact is no indictment of the physicians or medical services of this country." (26)

"... about two-thirds of the rejections were for causes which are beyond the powers of the medical profession to prevent or correct, regardless of the amount of medical service available and regardless of the cost of medical care." (27)

These remarks refer especially to the large number of rejections for venereal and mental diseases, heart diseases, etc.

THE TRUTH is:

It is not a question of blaming doctors or anybody else. It is a question of facing facts about existing diseases and defects.

Dr. Leonard G. Rowntree, Medical Chief of Selective Service, said:

"We are not the vigorous people that we thought we were." And..."There is no question but that the high cost of medical care is a factor in a very considerable proportion of those suffering from defects, illnesses, and disease... Conservatively, I would estimate that 700,000 of these men (4,200,000 IV-F's) are rejected for remediable defects. This means 1 out of every 6 men..." (28)

Venereal diseases can be greatly reduced by medical care. "The percentage of infant deaths due to syphilis has been cut one-half" during the last decade. "The syphilis mortality rate for adults has been brought down a third. Admissions to institutions of patients suffering from syphilitic insanity have steadily declined." (29)

A large proportion of the cases of "nervousness," "emotional instability," and "personality disorder" which were rejected could be relieved by psychiatric treatment. (30)

"On the basis of present knowledge, adequate health measures, preventive and curative, could have lowered draft rejections for...various cardiovascular disorders..." (31)

Hernia is easily curable by surgery. (32) Hernia caused 260,000 rejections in 1945.

The United States Public Health Service compared the records of a group of rejectees with the records of these same young men while they were in school 15 years before. A large proportion of the diseases and defects which caused rejection were found to have existed in childhood but had not been cared for. (33)

11. DAYS LOST THROUGH SICKNESS

OPPONENTS of National Health Insurance say:

"In 1900 the average American workman lost 28 days a year from his work because of illness. In 1935, the average workman lost only 8 days of work a year from illness. Our record in illness is $3\frac{1}{2}$ times better than it was at the start of the century." (34)

THE TRUTH is:

These statistics are phoney! The 28-day figure for 1900 is the average number of days-lost by those workers who were sick. The figure for 1935 is the average number of days lost by all the workers, including those who were not sick at all as well as the ill ones.

Neither figure has changed much since 1900. (35)

12. BRITAIN'S MEDICAL SERVICE

OPPONENTS of National Health Insurance say:

"This is how it was in Britain. The doctor got back to his office just at 2 o'clock. 'How many?' he said to his nurse. 'Forty.' Casually, without hurrying he put on his white jacket and poked his head into the waiting room where the 40 patients sat. 'Will those of you troubled with headache please stand,' he said. Six stood. The doctor took identical printed prescriptions out of his desk and handed one to each of the six and dismissed them. Then he said, 'Will those of you troubled with a cough please stand.' Another group got up, and again he handed them printed prescriptions and dismissed them. The others, he took one by one into his private office for a few minutes. Two hours later the office was empty, the 40 patients gone. This was an average of three minutes to a patient." (36)

THE TRUTH is:

This statement has no basis in fact. Dr. Charles Hill, the secretary of the British Medical Association declares it to be "gross libel." He said this in a letter to the Journal of the American Medical Association which was published in that journal on November 9, 1946. In his letter, he labelled the story a "preposterous illustration of the methods of British National Health Insurance Practice" and said further, "this is not the first time I have had occasion to protest against the misleading and inaccurate accounts given, evidently at second hand, by certain American doctors who are endeavoring to avert the introduction of any health insurance scheme into their own country by denouncing the British scheme." TWENTY QUESTIONS ON NATIONAL HEALTH INSURANCE

1. HOW OFTEN ARE PEOPLE ILL?

Among 1,000 average people during a normal year (1)

1 out of 3 will be sick once
1 out of 7 will be sick twice
1 out of 20 will be sick three times

In addition, there is unrecognized illness among many persons who consider themselves healthy..

At least 7,000,000 people -- 1 out of 20 -- are incapacitated by sickness or other disability in any twenty-four hour period. Half of these will remain disabled for six months or more. (2)

2. HOW OFTEN DOES PREMATURE DEATH STRIKE?

In terms of people -- 1,401,719 American civilians died in 1945. One out of every two was under 65. (3)

-- 5,668 mothers died in childbirth in 1945. (4)

-- 104,684 infants died before reaching their first birthday in 1945. (5)

3. HOW MUCH DO MATERNITY AND INFANT DEATH RATES VARY AMONG THE STATES?

Widely. The death rate among women at childbirth is three times as high in the five worst states as compared with the five best. In Connecticut, Minnesota, Oregon, Rhode Island and Utah, 12 to 14 mothers died per 10,000 live births (1945). Compare this rate with 32 to 38 mothers dying in Alabama, Georgia, Mississippi, New Mexico and South Carolina for the same year. (4)

Infant mortality rates tell the same story. In the four best states (Connecticut, Nebraska, North Dakota, Rhode Island), 28 to 30 babies died per 1,000 live births (1945). In the four worst states (Arizona, Colorado, New Mexico and West Virginia) 50 to 100 infants died in their first year. (5)

4. WHAT DO SICKNESS AND DISABILITY COST ANNUALLY?

In terms of people -- 23 million people suffer from chronic disease or physical impairment. (6)

-- Over one billion days per year are lost because of chronic illness. (7)

-- Over 40 per cent of the nation's selectees were unfit for military service. Many had remediable or preventable diseases or defects. (2)

In terms of production

-- About 600 million man days are lost annually. (2)

-- The average industrial worker is off his job about 12 days annually. (2)

In terms of money -- About $8 billion annually -- half in medical costs and half in lost earnings. (2)

The total annual costs of sickness and disability, including direct wage losses, direct business costs, plus "hidden costs" of loss of future earnings because of premature death and disability, come to more than $15 billion. (8)

5. HOW MANY DOCTORS DO WE HAVE?

There were 179,037 registered physicians in the United States in 1942*, including general practitioners and all types of specialists. (9)

The number of active physicians was estimated to be about 139,000, deducting those physicians who do not treat patients. (9)

This was about one active physician for every 1,000 potential patients. Such a ratio is generally regarded as sufficient for good service if doctors were evenly distributed. (9)

If we leave out specialists, there was only one active physician for every 1,500 people in the United States. (9)

6. HOW ARE DOCTORS DISTRIBUTED AMONG THE STATES?

Doctors are not distributed evenly. In the three best states and the District of Columbia in 1940 (California, Massachusetts, New York), there was one active doctor per 411 to 747 persons.

---

* We disregard the war years when the civilian physician force was greatly depleted.

But there was only one active doctor per 1565 to 1784 persons in the four worst states (Alabama, South Carolina, South Dakota, Mississippi). (10)

7. HOW ARE DOCTORS DISTRIBUTED WITHIN THE STATES?

There exist also differences in the distribution of active physicians within the states. The cities have more than their share; the rural areas less. In 1946, for example, 330 counties (10 per cent of the total of 3,070 counties) had less than one active physician per 3,000 population. Seventy-five counties had no active doctor. (11)

8. HOW MUCH DO DOCTORS EARN?

The average net income of doctors in 1941 was $5,047. In 1943, (latest year for which data are available) the average income of physicians rose to $8,688. (12)

However, one doctor in four had a net income of less than $2,000. Only one doctor in eight had a net income of $10,000 or more. (12) This was in 1941. There are no corresponding figures for 1943.

9. DO WE HAVE ENOUGH HOSPITALS?

There were 6,280 hospitals in the United States in 1946. Their capacity was 1,468,714 beds. (13) Four beds per 1,000 population is a minimum standard. Judged by this minimum: (14)

--Almost 5 in 10 counties fall below standard
--Only 1 in 10 meets it
-- Four counties out of every 10 have no approved general hospital. Fifteen million Americans live in these counties with no approved general hospital.

10. WHAT HOSPITALIZATION DO PEOPLE GET?

An average of one in nine persons in the United States was admitted to a registered hospital in 1946.* Of these 15,153,452 patients: (13)

14,782,502	or 97.5	per cent went to general and special hospitals
271,209	or 1.8	per cent went to nervous and mental hospitals
99,741	or .7	per cent went to tuberculosis hospitals

11. HOW MANY NURSES ARE THERE?

There were 173,055 active registered professional nurses in 1941 -- an average of one per 760 people. The best state

* Includes maternity, industrial, eye-ear-nose-and-throat, children's, orthopedic, isolation hospitals, convalescent and rest homes, etc.

(Connecticut) had one nurse per 336 people. The worst state (Mississippi) had one nurse per 2,143 people. (15)

12. IS THERE A SHORTAGE OF NURSES?

Yes. The National Nursing Council's Committee on Statistical Research says we were short 41,000 nurses as of August 1946. (15) Further, there were only 30,899 student nurses that year, compared with 56,567 in 1945. (16)

13. DO WE HAVE ENOUGH FULL TIME PUBLIC HEALTH SERVICES?

No. Forty million Americans live in communities without a public health department. More than half of our counties have no full time public health department. (17)

There is a shortage of 45,000 public health nurses, based on U.S. Public Health Service standard of one per 2,000 persons. (16) Our 1946 national average was only one public health nurse per 6,500 persons. There were only 21,171 public health nurses in 1946. (18)

14. WHAT DO WE SPEND ON HEALTH COMPARED WITH OTHER THINGS?

Item	Amount	Per cent of national income, 1946	
MEDICAL CARE (including insurance and supplies)	5.6 billions	3.4	
Jewelry	1.4 billions	.8	(19)
Tobacco	3.4 billions	2.	
Alcoholic drinks	8.8 billions	5.2	

It must be remembered that medical care is neither a desired comfort like tobacco or jewelry nor a desired necessity like food. It is an undesired necessity.

15. HOW MUCH DO WE SPEND ON MEDICAL RESEARCH?

The Federal Government spends about $28 million a year for research and development in medical and allied sciences. (20)

By contrast, the expenditure for research in plant and animal diseases was almost $30 million for one federal agency alone (1947). (21)

Business spends about $450 million a year on industrial research. (22)

16. WHY DO AMERICANS NEED HEALTH INSURANCE?

Every American may be hit any year by sickness costs ranging from a few dollars to hundreds or thousands of dollars. No one can predict in advance whether his sickness bills next year will

be unimportant or crushing. Therefore, everybody (except the wealthy) needs health insurance.

The people who have no incomes and must be supported by public or private charity, must, of course, have their sickness bills paid for them. But Americans do not want to have to turn to charity as a way of meeting their sickness bills.

17. HOW MANY AMERICANS CANNOT MEET SERIOUS SICKNESS COSTS WITHOUT ASSISTANCE?

Two out of every three persons -- about 97,000,000. This number is based on the estimate of the American Medical Association in 1939 that families with incomes under $3,000 need help to meet the cost of serious illness. (23)

In 1948, the percentage would be at least as high as in 1939, considering the increased cost of living.

At the National Health Assembly held in Washington at the bebeginning of May, 1948, the representatives of 17 national organizations agreed that: "The principle of contributory health insurance should be the basic method of financing medical care for the large majority of the American people, in order to remove the burden of unpredictable sickness costs, abolish the economic barrier to adequate medical services and avoid the indignities of a 'means test'."

18. HOW MANY PEOPLE ARE COVERED BY VOLUNTARY HEALTH INSURANCE PLANS?

According to figures presented at the National Health Assembly, voluntary health insurance plans showed an apparent total of about 45,000,000 members at the beginning of 1948. This figure, however, includes an unknown number of persons who belong to more than one plan, and may be several millions too high.

Not more than about 4,000,000 of these persons were covered by comprehensive medical care plans, providing home and office care from physicians, as well as care in hospitalized illness.

Of the remaining persons, the majority -- 25,000,000 or less have insurance for hospitalization only. The remainder have insurance for hospitalization and also have some of their doctor's fees covered, usually only surgical and obstetrical fees for care while the patient is in the hospital.

19. HOW WOULD NATIONAL HEALTH INSURANCE COMPARE WITH OUR PRESENT SYSTEM OF PAYING FOR MEDICAL CARE?

In 1946, over $5,6[redacted] billion were spent by the people of the United States for medical care including medical and hospital services, medicines and supplies, and health and accident insurance. In 1941, the total amount spent on medical care was over $3,4[redacted] billion. (19)

The amount spent for medical care by families varies with the various income levels. For example, in 1941, the average family with a yearly income of $1,250 spent $43 for medical care. For an income of $2,500, the average expenditure was $74; for an income of $3,600, $143. These figures exclude expenditures for dentistry and home nursing. (24)

The annual contribution proposed under National Health Insurance would be 3 per cent of earnings, but in the case of employed persons half of this would be paid by the employer. Thus:

An employee earning	$1,250	yearly would contribute	$18.75
An employee earning	2,500	yearly would contribute	37.50
An employee earning	3,600	yearly would contribute	54.00

Comparison with the above figures shows that the payments required of employed persons under National Health Insurance would be much less than these people spend at present for medical care. (24)

20. DO AMERICANS WANT NATIONAL HEALTH INSURANCE?

A nationwide poll by the National Opinion Research Center in 1944 showed: 82 per cent thought something should be done to help people pay for medical care; 85 per cent thought Social Security should include doctor and hospital care; 58 per cent were willing to pay a 2½ per cent deduction for this care. (25)

Public opinion polls in several states show:

84 per cent of New York State residents want health insurance. (Poll by N.Y. State Commission on Medical Care, 1946) (25)

70 per cent of Washington, D.C. residents endorse National Health Insurance. (Poll by Washington Post, 1946) (25)

50 per cent of California residents favored some government medical plan. (Poll by the California Medical Association, 1946) (26)

SUMMARY

NATIONAL HEALTH INSURANCE AND PUBLIC HEALTH ACT
(S. 1679, H.R. 4312, and H.R. 4313)

This legislation was introduced in both the Senate and the House of Representatives on April 25, 1949, following the President's special health message to Congress on April 22, 1949. The Senate sponsors are Thomas (D. Utah), Murray (D. Montana), Wagner (D. N.Y.), Pepper (D. Florida), Chavez (D. New Mexico), Taylor (D. Idaho), McGrath (D. Rhode Island), and Humphrey (D. Minnesota). The House sponsors are Dingell (D. Michigan), and Biemiller (D. Wisconsin).

While it carries the same health insurance features as S. 5 and H.R. 783, it is a much more comprehensive piece of legislation. It recognizes the need for:

(1) More doctors, dentists, nurses, hospital administrators and allied personnel.

(2) Research necessary to discover the causes, cures, and prevention of diseases that take a heavy toll of life and productivity.

(3) More hospitals and health centers.

(4) Personnel and facilities, including clinics and ambulance services, in rural and other shortage areas.

(5) More state and local public health services.

(6) More services for maternal and child health care and services for crippled children.

(7) A program assuring everyone of a means with which to pay for the health and medical care necessary to make and keep them well.

It proposes to meet these needs by providing:

(1) Funds for increasing the enrollment in schools of medicine, dentistry, dental hygiene, nursing, public health and sanitary engineering; for expanding the facilities of such schools; and for providing scholarships and maintenance funds to deserving students in these fields.

(2) The establishment of research institutes in the fields of Poliomyelitis, Diabetes, Arthritis and Rheumatism, Multiple Sclerosis, Cerebral Palsy and Epilepsy, and other diseases that take a heavy toll of life and productivity.

(3) Additional funds for the construction of hospitals, health centers, clinics, and group practice facilities under the Hospital Survey and Construction Act.

(4) Special funds ($35 million) to aid rural and other shortage areas in getting and maintaining personnel, hospitals, clinics, group practice facilities, mobile clinics and ambulance services, and funds to establish and operate demonstration farm health cooperatives in selected areas.

(5) Additional funds for the extension of state public health services and for the establishment and extension of local public health departments wherever needed.

(6) Additional funds to carry on programs for maternal and child health care, and for services to crippled children.

(7) The establishment of a national program of health insurance enabling everyone to pay for needed health and medical care services.

****

MORE SPECIFICALLY, EACH TITLE OF THE BILL PROVIDES AS FOLLOWS:

TITLE I

Federal Aid to Medical Education - Provides authorization of federal aid for the education and training of physicians, dentists, dental hygienists, nurses, sanitary engineers, hospital administrators, and other health personnel. Aid is for: the expansion and improvement of existing professional schools; the construction and equipment of new schools; the maintenance of schools through grants for each student up to an average past enrollment and incentives to increase enrollment through much larger grants for each student beyond the average past enrollment; scholarships awarded through the states, including students' tuition and expenses and a substantial sum towards students' maintenance.

Funds to help meet costs and to encourage increased enrollments will go to:

Medical Schools, $300 per student (based on average enrollment over the period June 1947-49) and, in addition, $1700 per student added to that average.

Dental Schools, $250 and $1,300.

Schools of Dental Hygiene, $150 and $800.

Schools of Nursing, $200 and $1,200 where room, board, textbooks, etc., are not provided; $200 for first year students, $150 for second year students and $50 for third year students in schools where these are provided.

Schools of Public Health, $350 and $2,400.

Schools of Engineering, $200 and $1,200 for students seeking degrees in sanitary engineering.

The administration of this Title is under the Public Health Service with a special advisory council. A section giving aid to the training of practical nurses is administered by the Federal Commissioner of Education.

TITLE II

Aid to Medical Research - Authorizes the establishment of additional Institutes in the National Institute of Health, under the United States Public Health Service, especially for "poliomyelitis, diabetes, arthritis and rheumatism, multiple sclerosis, cerebral palsy and epilepsy, and other diseases or groups of diseases." The Surgeon General is empowered to establish one or more additional Institutes, and to terminate or combine Institutes from time to time as may be required. Special advisory councils in each technical field are authorized.

TITLE III

Liberalization of Hospital Survey and Construction Act - This Title (a) doubles the length of the program now authorized, extending it until 1957; (b) authorizes

doubling the annual appropriation from $75,000,000 to $150,000,000; (c) liberalizes the grants-in-aid so that the poorer states may obtain up to two-thirds Federal contribution instead of only a flat one-third as at present; (d) permits grants to clinics and other facilities for group medical and dental practice, not at present authorized; and (e) authorizes a special appropriation for studies and demonstrations in the local and regional coordination of hospital facilities.

TITLE IV

Part A

Special Aid for Rural and Other Shortage Areas - Through an authorized annual appropriation of $35,000,000 for four years, rural and other areas short of personnel and facilities could obtain help to meet a variety of needs, e.g.: (a) Grants or loans guranteeing income to doctors, dentists, and others who would practice in such an area; (b) Aid towards the travel costs of these persons and their families to encourage their establishment in such areas; (c) Mobile clinics; ambulance service in connection with hospitals inside or outside the area; (d) Loans to supplement inadequate local funds for construction under the hospital construction Title; (e) Grants for the maintenance of hospitals, group practice units, health centers and clinics; (f) Grants and loans for construction and equipment of group practice units and of diagnostic and treatment clinics.

These aids to rural and other shortage areas are to be administered by the National Health Insurance Board. This board may deal directly with the local areas until a state plan has been approved under the national health insurance Title. Thereafter, the operations will be part of the state plan.

Part B

Assistance to Farmers' Experimental Health Cooperatives - From authorized appropriations of $10,000,000 for the first year and $15,000,000 for each of four succeeding years, aid may be furnished to rural cooperative organizations established to provide medical services in areas which are in need of such services and in which "surveys indicate that such cooperatives may be practical." Aid may be through (a) technical assistance for surveying needs and for organizing the cooperative and (b) towards the facilities and maintenance of the cooperative during its initial years. Not more than 50 projects, nor more than 2 in any state may receive such aid. This program is to be administered by the Public Health Service in consultation with the Department of Agriculture.

TITLE V

Aid to States for State and Local Public Health Work - This Title broadens and liberalizes the existing grant-in-aid system under the Public Health Service, with the aim of extending local public health units where needed and of expanding and improving special health services under health departments.

TITLE VI

Aid to States for Maternal, Child Health, and Crippled Children's Services - Provides similar expanded grants-in-aid for these functions through the Children's Bureau and funds for the children's Bureau to carry on research in child life.

TITLE VII

National Health Insurance - This Title provides, just as the health insurance titles of S. 5 (81st Congress) and S. 1320 (80th Congress) the following:

1. A system of health insurance, national in scope, and covering approximately 85 percent of the population. This includes employees, self-employed persons, and the dependents of all such persons.

2. Persons eligible for benefits would be entitled to medical and dental service from general practitioners and specialists, home nursing care, hospital care, laboratory service, x-rays, expensive prescribed medicines, eye glasses and special appliances.

3. Free choice of doctor and dentist by the patient is guaranteed, as well as the right to change one's choice.

4. Every qualified doctor, dentist, nurse and hospital is guaranteed the right to participate or not, and to accept or reject patients. These guarantees apply to organized groups of practitioners, clinics, consumer cooperatives and similar health service plans as well as to individuals. Every hospital that participates is guaranteed freedom from governmental supervision or control.

5. Payments to doctors from the fund can be made on a fee-for-service basis (as at present), on a capitation basis (so much for each person who has chosen a particular doctor), or on a salary basis - the decision will be made for each local area by the doctors practicing in that area, but should individuals or groups of doctors in the area prefer a method different from that chosen by the majority, this too is permissible.

6. Provision is made for grass-roots administration of the program. In each local area, administration would be carried out with the help and participation of local citizens, including members of the medical profession. Each state is given the right to administer the system through its own state agency, and to divide the State into local areas. The State plan must meet certain general requirements stated in the bill. At the Federal level, administration is under a 5-man board, assisted by an advisory council of lay and professional people.

7. State and local agencies responsible for the subsistence and health care of needy persons, (persons having insufficient earnings to contribute to the health insurance fund) may provide medical services for these persons by paying into the health insurance fund on their behalf. (The Administration's Public Assistance legislation now before the House Ways and Means Committee provides federal aid to the States to finance this.)

4/26/49

WHAT NATIONAL HEALTH BILLS ARE BEFORE THIS CONGRESS?

1. Two major legislative proposals are before Congress (80th). Each purports to establish a national health program. S. 1320, "The National Health Insurance and Public Health Act," was introduced by Senators Wagner, Murray, McGrath, Pepper, Chavez and Taylor. S. 545, "The National Health Act of 1947," was introduced by Senators Taft, Ball, Smith and Donnell as a "substitute" for the National Health Insurance Program.

2. The National Health Insurance and Public Health Act, S. 1320, sets forth a comprehensive health program, as recommended by President Truman in several messages to Congress. This bill includes insurance against the costs of medical care for practically everyone, federal aid to the states for public health, for research and for medical education, for maternal and child health programs, for hospital construction. The program would be administered with federal, state and local participation, with emphasis on local responsibility.

3. S. 545 provides federal grants to the states, for their use in making some medical care available to that fraction of the population which qualifies as "needy." The program would be administered almost entirely by states without any national standards.

The two measures contrast in the following respects:

NAME OF BILL

S. 1320 - The National Health Insurance and Public Health Act - sponsored by Senators Wagner, Murray, McGrath, Pepper, Chavez, and Taylor.	S. 545 - The National Health Act of 1947 - sponsored by Senators Taft, Ball, Smith, and Donnell.

WHO WOULD BE SERVED BY THESE TWO NATIONAL HEALTH BILLS?

Substantially everyone. All persons (and dependents) who work for a salary or wage and all persons (and dependents) who are self-employed - farmers, business-men, professional men and women, as well as workers in industry, agriculture, commerce, domestic occupations, and federal service. (pp. 60, 61, 65)	Only persons of "low income"-(p.14) that fraction of the population which qualifies as "needy" and would be willing to accept medical care on this "charity" basis. It would be up to the states to decide just who those people are.
Recipients (and their dependents) of Old Age and Survivors Insurance or of civil service benefits. (p. 11)	If a state does not choose, or is financially unable to participate, no one residing within that state would be served.
Needy persons who cannot be insured because of lack of earnings would receive the services of the insurance program whenever contributions to the insurance fund were made on their behalf by a public agency - city, county, or state (p. 13)	The sponsors declared that 20-25% of the population would receive assistance under this measure. (p. 48 of Part 1 of 1947 hearings) Reliable statistics show that the funds authorized would be sufficient to care for only 5-10% of the population.

S. 1320	S. 545
WHAT HEALTH SERVICES WOULD BE AVAILABLE?	
All services necessary to prevent, diagnose, and cure disease. (p. 5)	"General" (not comprehensive) hospital, surgical, and medical services; also periodical health examinations for school children. (p.16)
Care by a general practitioner and specialists, hospital care, laboratory service, x-ray, unusually expensive medicines, special appliances, and eyeglasses. (p. 5)	There is no assurance that medical services will be provided in the patient's home or the physician's office, since the individual state may choose to provide care only in an institution or clinic. (p. 18)
Dental, home nursing, and auxiliary services insofar as personnel and facilities are available. (Children are given a priority on dental care.) (p. 8)	Dental examinations to all school children, but dental care only for those who are "needy" (whatever a state decides "needy" is). (p. 29)
HOW WOULD THESE HEALTH SERVICES BE PAID FOR?	
Through insurance. Workers would contribute a small regular sum, amounting to 1½% of their earnings up to $3,600 (but never more than $54 a year). This would be matched by their employers. (No page reference. Announcements of intention by sponsors of bill are the authority for this statement.)	Through Federal Tax grants and matching state funds. Annual appropriations of $200,000,000 for each of five years from general tax funds for the medical and hospital services. Nearly everyone would therefore be paying for this program through general taxes. (p. 16)

S. 1320

Self-employed persons would contribute 3% of their earnings (but never more than $108 a year).

The Federal Government would appropriate sums to make up the difference between the cost of providing the services and the insurance premiums collected. (The Federal contribution for 1950-52 would be limited to ½% of the estimated annual average of all wages received during the 3 preceding fiscal years, and a 1% contribution on the same basis for 1953-55). (p. 52)

Physicians in each locality would choose the method by which they wish to be paid from the insurance fund for their services (e.g., fee for each service, salary, or according to the number of their patients). (p. 20)

Voluntary health insurance plans could continue to provide services under this bill, and would be reimbursed from the insurance fund. (p. 17)

S. 545

This money would be granted to states wishing to participate. Proportionately larger sums would be allocated to the poorer states. (21) However, each state would have to match the Federal money dollar for dollar. Thus the poorer states would have to put up more money.

States would be allowed to count their present expenditures for medical care as part of their matching funds. Most states already spend more for medical care than they would have to put up to match the federal allotment. Thus there would be little new money to spend, except what came from the federal government. (p. 19)

Voluntary insurance plans could be reimbursed for services rendered but only in behalf of "needy" persons. (p. 18)

S. 1320	S. 545

WOULD THESE TWO BILLS PROVIDE FREE CHOICE?

Patients have free choice of their family physicians and other doctors, hospital, dentist, and nurse. They would also be free to choose to receive their services through a group health association or other approved medical service plan. (p. 9)	"There is no guarantee of freedom of choice of physicians in the Bill." A patient would be restricted in his choice of physician if the state decided to provide services only in an institution or in a clinic. (No page reference. Quote from Journal of AMA July 12, 1947)
Doctors have free choice of patients (p. 9) All physicians, hospitals, dentists, and nurses are free to serve under the Plan or not as they choose; to reject patients when they choose. Just as they may do now. (pp. 14-16)	A patient would be restricted in his freedom of choice of group health association or medical service plan, if a state made an exclusive contract (which the bill permits) with a particular medical service unit.

HOW WOULD THESE TWO BILLS BE ADMINISTERED?

By representatives of the people chosen according to democratic methods.	By people who in effect would be the representatives of "organized medicine" (appointees of the AMA and influenced by state medical societies.)
Major administrative responsibility would be placed in the localities where the services are rendered. (pp. 25-32)	A new Federal health agency, separate from any existing agency would be created. Its head must be a physician, and likewise, under him, the Director
The local set-up would consist either of a local administrative committee or of an administrative officer working	

S. 1320	S. 545
with an advisory committee. Such local committees would include both lay and professional people. (pp. 26-28)	of Medical Care. There is no requirement that these appointees have previous experience in administration.
National and state advisory councils would have similar representation. (pp. 33-42)	Administration would be almost entirely in the hands of the states. After a short initial period, the administrative agency must be the state health department. (pp. 14-17)
At the federal level, administration would be by a board (within the Federal Security Agency) of five full-time public officials. The states would also have their part. (p. 38)	Advisory Councils would be appointed in the Federal Agency and for each state. These would be primarily professional, with no guarantee for even minority representation of the people who pay the bills or receive the services.
All strictly medical matters would be in the hands of physicians. (p. 29)	

Q. HOW MUCH IS ALLOCATED TO MEDICAL RESEARCH AND MEDICAL EDUCATION?

A. First year $10 million and 2nd year $15 million, thereafter up to 2% of the amount available for benefits during the preceding year. (p. 58)	A. Nothing

Q. HOW MUCH IS ALLOCATED TO HOSPITAL CONSTRUCTION?

A. Raises from $75 million to $100 million the Hospital Survey and Construction Act a year after the first year. (p. 82)	A. Nothing

Q. DO THESE TWO MEASURES DIFFER IN UNDERLYING PRINCIPLES?

A. Yes. The National Health Insurance and Public Health Act (S. 1320) moves toward the fulfillment of an important item in the late President Roosevelt's Bill of Rights for all Americans: "the right of adequate medical care and the opportunity to achieve and enjoy good health."

S. 1320 is based on the principle that people should pay their way in proportion to their means, in this case by small regular payments into the insurance fund, and should therefore have needed medical services as a right, not as a charity.

President Truman said in his special Health Message to Congress May 19, 1947, regarding national health insurance: "it is - in the long run - far less costly and more effective than public charity or a medical dole."

On the other hand, the so-called "substitute" bill, S. 545, is based on the principle of public medical charity. It ignores the fact that at least 70 per cent of self-supporting families cannot meet the cost of adequate medical care without financial distress or disaster. These Americans do not want charity. They want a self-respecting method of meeting sickness bills such as the insurance principle provides.

Q. WHO SUPPORTS THESE MEASURES?

A. There were public hearings on S. 545 and S. 1320 from May to July, 1947, and intermittently from January to March in 1948. At these hearings, support for the Taft Bill (S. 545) came only from the American Medical Association, allied medical and dental organizations, hospital associations, and a few insurance companies. No representatives of business, labor, farmers, or other citizen groups testified in its favor.

On the other hand, the people who would receive the services and pay the costs vigorously opposed the charity principle and monopoly control inherent in S. 545. These people, representatives of labor, both A.F. of L. and C.I.O., consumer, church, farm, cooperative, veteran, and some medical groups strongly supported the National Health Insurance and Public Health Act.

Only a small fraction of the people receive the full benefits of modern medecine...(medical science) .

The problem of e gineering a method which will remedy this state involves a ~~such a~~ wide, yet inextricably kin , variety of considerations., that we see that any program working to promote the most thorough degree of health in this country must move forward simultaneously on several fronts: not only in the actual giving and receiving of medical care, but in the requisite fields of medical education, hospitalization, adequate nursing staffs and training facilities, a health education ~~course~~ program which will be easily available to the citizenry, rural and urban, adult and school age. This program would in lude nutrition training, all important in preventing disease and in maintaining a higher degree of health.

It is immedia te ly necessary for the layman to see that without a real purchasing power, there will be no establishing of hospitals in rural regions, nor will there be Doctors willing to set up a practice there since there would be no paying clientele. But if the numbers of people who need medical attention today had the purchasing power to pay for a doctor's attention and ~~a~~ hospital service, there wouls probably be a treblefold demand for the construction and maintenance of hospital facilities, and, most importa nt for the training and invitation to rural areas of young medical men.

Merely the training of more doctors, then, would not be the answer to the nations health problem, because hundreds of people who are now temporarily or chronically ill, have no purchasing power, hence must completely by-pass the needed attention. Until these people aquire, by some m eans, the finanancial position to be able to afford to get help when they are sick, they will continue to be a burden to the standard of the nation's health... and , the demand for medical service(hospita ls, nurses, doctors, etc.) will not increase. Though the actual demand will not increase the ~~demand~~/need will be everpresent.

If these needs, unexpressed, or even surpressed for lack of purchasing power exist now, then what is to be done about it? What is the solution? Several answers have been offered. The American Medical Association , which should certainly be qualified to know, says that the medical profession should be left alone to solve its own problems. That the main need is to increase the number of doctors.... Senator Taft and some others have suggested that there be a large grant of miney , to be proportioned to the states for Charity service. . The Congress pa ssed a Bill in 1946, the Hill-Burton Bill, which attacks one side of the problem, the hospital side. But it becomes evident that there must be an adequate demand for these hospitalfacilities by patients who can payfor the service...and a purchasing power which will draw doctors to the areas needing their service. This purchasing power would be supplied bey the Ewing proposition which has lately been presented to President Truman. This bill is principally concerned with giving the patient the money to pay for medical service. This money comes to them in the form of Health Insurance.

FOR IMMEDIATE RELEASE

The ten year health program mapped by Federal Security Administrator Oscar Ewing to give the rural population "a square deal in medical services for the first time in our Nation's history", was lauded today by Dr. Channing Frothingham, chairman of the Committee for the Nation's Health and former president of the Massachusetts Medical Society. Ewing's Report to the President placed special emphasis on rural health needs.

"Ewing's realistic outline for national health insurance," Dr. Frothingham stated, "would tear down the economic barrier which now prevents two out of three Americans from getting the adequate medical care they need. It would at last free doctors and patients from the tyranny of the high cost of medical care so that everyone, regardless of economic status, could afford the miracles of modern medicine. It would bring to rural areas ambulance services, special scholarships for rural medical students. It would enable our people who live in rural areas to get their fair share of doctors, nurses, and medical facilities.

"The 100,000 practicing doctors throughout the nation, like myself, will be reassured to note that national health insurance does not mean regimentation of doctors or state control, and will not interfere in any way with the doctor-patient relationship. Ewing's detailed blueprint, including a sensible three-year 'tooling up' period to break bottlenecks, contains the most specific guarantees of freedom of choice for doctors and patients. His emphasis on decentralization and local control, with strict check on federal powers, dispels fears of 'state medicine'.

"With this plan, and with the knowledge that public opinion polls have repeatedly demonstrated the American people's desire for national health insurance, it is the duty of Congress to enact this much needed health program.

"As chairman of a nation-wide non-partisan Committee of doctors and laymen," Dr. Frothingham concluded, "I call upon Republicans and Democrats alike to enact this program into law. The time has come to take the politics out of health."

The Committee for the Nation's Health numbers among its officers Russell Davenport, William Green, Bishop Francis J. McConnell, Philip Murray, Bishop G. Bromley Oxnam, Thomas Addis, M.D., Barry Bingham, Morris Llewellyn Cooke, Gerard Swope, Mrs. Gardner Cowles, Mrs. Albert D. Lasker, R. M. Walls, D.D.S., Matthew Woll, and Dr. Michael M. Davis, Chairman of the Executive Committee.

(HIGHLIGHTS OF EWING'S RECOMMENDATIONS FOLLOW)

SUMMARY OF RECOMMENDATIONS FOR NATIONAL HEALTH INSURANCE

"The earliest possible enactment of Government health insurance" is urged by Federal Security Administrator Oscar Ewing as the "best means" to realize the nation's health goals of "complete health and medical services....for every man, women, and child, without regard to his race or religion, the color of his skin, his place of national origin or the place he lives in our land, and without regard for his personal economic status."

In his extensive 186 page report drafting a ten-year national health program, Ewing advises the President that he can see "no other possible way of bringing adequate medical service to fully half of the American people." He warns that 70,000,000 Americans cannot now afford to pay for adequate medical care.

"Improvement of rural health" is emphasized as a requirement for raising the levels of national health. "We can and we should base our planning for health insurance on the premise that farmers and agricultural workers will be included under the coverage of health insurance."

The National Health Insurance program outlined by Ewing guarantees free choice for both patient and doctor. It would be financed for the first three years by a one-half or 1 per cent contribution on the first $4800 earned in a year, this contribution to be made either equally by employers and employees, or as might otherwise be prescribed by law. In subsequent years, the rate of contribution would rise. He also recommends that the program be "administered through Federal-State-local cooperation...so that the keynote is decentralization and local participation."

The report also says: "The law should make special provisions to meet the needs of rural areas and the urban centers which serve them." Particular flexibility is advocated to assure "steady financial support in areas that previously have lacked the funds to attract personnel or to finance facilities...."

In the first "time-table" ever prepared for National Health Insurance, Ewing recommends immediate legislation and then a three-year "tooling up" period to break professional and other bottlenecks.

His report emphasizes that health needs are grave particularly in rural areas, among minorities and other low income groups. Ewing cites the higher death rate and maternal and infant mortality rates in the poorer Southern states as compared with the markedly lower rates in the richer industrial East as evidence that income directly affects health.

Ewing asserts that revision of the American Medical Association's 1939 research figures to allow for the intervening rise of approximately 75 per cent in the cost of living indicates that families with an income below $5,000 cannot now meet serious sickness costs without outside aid. "Nearly 80 per cent of our families (112,000,000) earn less than $5,000 and consequently would have difficulty meeting the cost of a serious or prolonged illness.....Close to 70,000,000 will have difficulty in

(more)

providing adequate minimal care for themselves and their families."

Ewing cites as evidence of the increasing demand for a better way to pay the costs of medical care the unanimous conclusions of the delegates to the National Health Assembly this spring: "The principle of contributory health insurance should be the basic method of financing medical care for the large majority of the American people in order to remove the burden of unpredictable sickness costs, abolish the economic barrier to adequate medical services and avoid the indignities of a 'means test'."

(Representatives of a score of national organizations, including the A.F. of L., C.I.O., farm, labor, cooperatives and others, also declared that National Health Insurance is the only real solution of the nation's health problems.)

Ewing states that voluntary insurance programs alone cannot provide enough medical care at low enough rates to the entire country. Despite the "solid achievements" of the voluntary plans, he points out that less than 3 per cent of the population is covered by comprehensive health insurance.

"As measured against national need, the voluntary insurance plans show these deficiencies: 1) "They offer benefits that are inadequate....They cover only a fraction of the population....and will never be able to cover more than half of the total population"; 2) "They have the poorest coverage where the national need is greatest" -- in low income areas; 3) "the voluntary insurance plans can never do the job that the national interest requires to be done."

The recent Brookings Report, which doubts the need for National Health Insurance, is rejected by Ewing. He avers that American health, while good, "has serious deficiencies."

A four-phase "time-table" for a national health program is presented: 1) Passage of Federal legislation and setting broad policies; 2) A three-year "tooling up" period to establish procedures and coordinate services; 3) Initial operation geared to existing facilities; 4) Ultimate expansion to include complete medical coverage for everyone.

Ewing rejects sharply the contention that National Health Insurance is "socialized medicine" and points to the guaranteed freedom of choice for both doctors and patients and to the strict curbs he proposes be placed on federal powers.

After a careful weighing of the facts, Ewing concludes that in regard to the quality of medical care, the plan "for a Government system of prepaid insurance would.....for the Nation as a whole....work toward a vast improvement."

Social Legislation Summary

80th Congress

A SUMMARY REPORT ON CONGRESSIONAL ACTION IN THE FIELDS OF HEALTH, EDUCATION, AND SOCIAL WELFARE GENERALLY

The role of the federal government in the development and financing of social programs in the fields of health, education, and social welfare generally, is a factor of major importance.

At present, federal grants to the states in these fields alone add up to almost one and a half billion dollars annually. This is in addition to social welfare functions which are federally operated but nevertheless constitute direct aid to state and local governments, as well as voluntary organizations, in planning for needed community services. For example, the federal government assumes the total cost ($6,000,000,000 this year) for many of the medical, hospital, educational, and welfare needs of the veteran population. Also, under the federal old-age and survivors insurance program, benefits are being paid to over two million persons. It is because of these and similar activities that it is now generally held that it is impossible to plan for state and local community services without taking into account possible changes in the federal picture.

Health

Several new health laws were enacted by the 80th Congress, and increased appropriations were voted to expand many of the existing federal-state health programs. The major part of the $160,000,000 appropriated to the United States Public Health Service was earmarked for grants-in-aid for various community disease control programs, medical research, and the training of needed health personnel.

HEART DISEASES: More than one in every three deaths is due to diseases of the heart or circulation. Among children of school age, heart disease (chiefly rheumatic fever) ranks second only to accidents as a cause of death. To help meet this problem, Congress enacted the National Heart Act. In general, this law has a threefold goal:

1. Increased cardiovascular research
2. Improvement and expansion of heart disease detection and diagnostic services
3. Training of workers both in the fields of research and matters relating to the diagnosis, prevention, and treatment of heart diseases

For these purposes, Congress voted an appropriation of $3,144,088 for the fiscal year commencing July 1, 1948.

Nonprofit Tax-exempt Agencies

Two proposals of direct importance to nonprofit, tax-exempt organizations were considered by the 80th Congress.

SOCIAL SECURITY COVERAGE: Nonprofit organizations which are exempt from federal income tax under section 101 (6) of the Internal Revenue Code are now specifically excluded from the old-age and survivors insurance program. Shortly before the end of the session, the House passed House bill 6777 to permit coverage of such organizations on a voluntary basis. Likewise, public employment was covered on a voluntary compact basis. In the Senate, however, no action was taken on the bill because of lack of time to study the proposal. The Senate Finance Committee had received a report from its Social Security Advisory Council recommending compulsory coverage for employees of nonprofit institutions.

TAX-EXEMPT STATUS: The House Ways and Means Committee had considered proposals to require tax-exempt organizations to segregate their commercial activities (income derived from business activities and investments) from their nonprofit operations "to facilitate the collection of income taxes that such profits should be made to bear." The committee decided to take no action on this proposal this year because of lack of sufficient information. Instead, it included in House bill 6712 (a general tax law revision measure) a provision to require additional nonprofit tax-exempt organizations to file annual information returns (Form 990) supplying information relating to their income, expenses, assets, liabilities, and methods of operation. This bill was passed in the House too late in the session to receive consideration by the Senate.

Both proposals are expected to receive serious consideration in the 81st Congress.

SOCIAL LEGISLATION SUMMARY is issued by the Social Legislation Information Service, Inc., 930 F Street, N. W., Washington 4, D. C. It is a nonprofit association which reports impartially on federal social legislation and the activities of federal agencies affecting family life, children, and community services in the areas of health, education, welfare, housing, employment and recreation. The Service takes no position for or against legislation.

This pamphlet is based on information reported in the bulletins of the Social Legislation Information Service.

HEALTH

Continued from Preceding Page

DENTAL DISEASES: Research findings of the United States Public Health Service demonstrated that through the use of a sodium fluoride solution applied to children's teeth, dental decay can be lowered from 40 to 50 percent. Congress voted $1,000,000 to enable the Public Health Service to establish field demonstration units for the following purposes:

1. To publicize and promote interest generally in the new procedure
2. To demonstrate the correct techniques for applying the procedure
3. To serve as a training mechanism for public health personnel

The National Dental Research Act was enacted into law to provide for increased research into the problems of dental health. This law also contemplates increased training of personnel in matters relating to the diagnosis, prevention, and treatment of dental diseases. The law authorizes an annual appropriation of $750,000 for these purposes.

MENTAL HEALTH: A further expansion of the national mental health program was approved. Grants-in-aid for the development and maintenance of community mental health services were increased to $3,550,000 (last year's appropriation was $3,000,000). Likewise, research and training grants were increased to $2,000,000 (last year's appropriation was $1,529,700). Smaller increases were also approved for the various research, training, demonstration, and consultative services of the Public Health Service.

WATER POLLUTION: Evidence was submitted to Congress showing that the pollution of interstate waters constitutes a major health hazard. To help meet this problem, Congress enacted the Water Pollution Control Act to establish a national program for eliminating or reducing water pollution. Federal aid will be in the form of both grants for investigations and planning, and loans to help finance construction of needed projects.

HEALTH APPROPRIATIONS: Among the appropriations voted by Congress for various health programs for the fiscal year commencing July 1, 1948 are the following:

Control of venereal diseases	$17,230,000
Tuberculosis control	9,291,000
General public health work	13,865,000
Control of communicable diseases	7,490,000
National Institute of Health (medical research)	13,670,000
Cancer research and control	14,000,000
Hospital construction program	40,000,000
Construction of a medical research center	40,000,000
Maternal and child health services	11,000,000
Services for crippled children	7,500,000

PENDING LEGISLATION: The Senate Health Subcommittee held very extensive hearings on proposals to establish a national health program. The hearings centered around the Taft Bill (S. 545) to provide $200,000,000 a year in grants to the states for health services for those unable to pay, and the bill (S. 1320) to establish a system of compulsory health insurance. Neither bill was acted upon. It was decided that additional study was needed of existing national health problems and proposed methods for meeting these problems. Among the other bills considered but not passed by the 80th Congress are the following:

A bill to provide federal aid to assist each state in providing full-time local public health services in all areas of the state. (House bill 5644 was reported favorably to the House.)

A bill to provide about $12,000,000 a year to assist states in the establishment and maintenance of school health services for the prevention, diagnosis, and treatment of physical and mental defects and conditions of school children. (Hearings were held on House bill 1980 and Senate bill 1290.)

A bill to provide federal aid to the states in providing various expensive drugs and medical services. (Hearings were held on Senate bill 678.)

A bill to support research and training in poliomyelitis and other diseases. (House bill 6732 was reported favorably to the House.)

A bill to create a National Science Foundation with authority to support basic medical research. (Senate bill 526 was passed in the Senate, but on the House side House bill 6007 was reported favorably but not passed.)

Social Welfare

PUBLIC WELFARE: The largest single federal grant-in-aid program is for federal aid to the states in providing old-age assistance, aid to dependent children, and aid to the blind to more than 3,500,000 persons. For the fiscal year commencing July 1, 1948, it is expected that federal aid will total about $1,000,000,000.

The 80th Congress voted to increase the federal contributions for these three programs by approximately $184,000,000 annually by increasing the share of the costs to be met with federal funds. Congress also allowed the full amount ($3,500,000) of the annual authorization for grants to the states for public child welfare services.

OLD-AGE AND SURVIVORS INSURANCE: OASI coverage now extends to about three jobs out of five. There were over two million persons actually receiving benefits in March 1948, at a monthly rate of $40,500,000.

During the closing days of the 80th Congress, the House passed a bill (House bill 6712) which provided for extension of coverage to approximately 3,500,000 additional persons (some on a voluntary basis), and also liberalized some family benefits—particularly for children. This bill reached the Senate too late for consideration and action. The Senate Finance Committee had received a report from its Social Security Advisory Council recommending a more comprehensive expansion and liberalization of this program.

Congress passed over the President's veto two bills which specifically excluded from social security coverage approximately 500,000-750,000 persons working in such occupations as commission salesmen, life-insurance salesmen, newspaper and magazine vendors, and others considered by Congress to be "independent contractors" rather than "employees".

SOCIAL SECURITY ADMINISTRATION: Congress transferred the U. S. Employment Service from the Department of Labor to the Social Security Administration of the Federal Security Agency. It also required a considerable reorganization of the Social Security Administration by a series of appropriation changes which transferred many of its supervision and planning activities (including its field offices) to the level of the Federal Security Administrator. The appropriation for the Office of the Social Security Commissioner was reduced from $3,131,165 to $302,000. Of the former amount, all but approximately $500,000 was transferred to the Federal Security Administrator or to operating bureaus. Considerable reductions were made in research, statistics, and informational services.

VOCATIONAL REHABILITATION: For the fiscal year commencing July 1, 1948, Congress appropriated $18,000,000 for grants to the states for rehabilitation programs for persons of employable age having physical or mental handicaps which impair their ability to find or hold regular jobs.

Education

FEDERAL AID: For a decade or more Congress has had before it proposals to provide federal grants-in-aid to the states for the support of elementary and secondary education. During the 80th

Congress, a bill (Senate bill 472) for this purpose came closer to final approval than at any other time. In brief, this bill authorizes the annual appropriation of $300,000,000 for grants to the states for the general purpose of enabling them to provide a minimum annual expenditure of $50 per pupil. The bill passed the Senate by a vote of 58 to 22, and was reported favorably by the House Education Subcommittee. It was not acted upon by the full committee and did not reach the floor of the House for debate and action. The sponsors of this bill have indicated that they will have it reintroduced in the 81st Congress.

SCHOOL LUNCH PROGRAM: Federal aid to the states for the school lunch program was continued. For the fiscal year commencing July 1, 1948, Congress voted an appropriation of $75,000,000. This amount is $5,000,000 more than the sum available for the preceding fiscal year, but $6,000,000 less than the appropriations for the fiscal year ended June 30, 1947.

LANHAM ACT SCHOOL AID: Since the war period, Congress has provided financial aid to schools overburdened with war-incurred enrollments. For the fiscal year ended June 30, 1948, Congress had appropriated $4,500,000 for this purpose. This year, Congress extended this law to include school districts in need of assistance because of reactivation of defense establishments or the operation of new defense activities. Against a maximum appropriation of $6,000,000 authorized by this law, an initial $3,000,000 was actually voted.

SURPLUS EDUCATIONAL SUPPLIES: Public Law 889 authorizes the armed services to donate for educational purposes such equipment, materials, books and other supplies as are no longer needed by them.

TEMPORARY WAR HOUSING: Public Law 796 permits colleges and universities operating projects constructed, acquired, or made available under title V of the Lanham Act to acquire complete ownership and control of these projects without monetary consideration.

VOCATIONAL EDUCATION: Congress appropriated $19,842,760 to the U. S. Office of Education for grants to the states during the fiscal year commencing July 1, 1948 for further development of vocational education programs in agriculture, home economics, trades and industries, and distributive occupations. This sum is in addition to the usual annual grants to the land-grant colleges.

PUBLIC LIBRARIES: The Senate passed the bill (Senate bill 48) to provide federal aid to the states for setting up demonstrations of free library service in areas inadequately served or without any kind of library service. The House subcommittee which considered the bill reported it favorably to the full Committee on Education and Labor which, however, took no action on the proposal.

Housing

GENERAL HOUSING BILL: The principal housing bill considered by the 80th Congress was the bipartisan Taft-Ellender-Wagner long-range housing bill (Senate bill 866). This bill seeks to establish a permanent national housing policy and program. In brief, the bill consists of a series of interrelated titles including various aids to the building industry as well as provisions for slum clearance, public housing and farm housing. The bill was passed in the Senate and a similar bill was reported favorably to the House. However, the bill did not reach the floor of the House for consideration because the House Rules Committee, by a vote of 6 to 2, tabled the measure. The sponsors of this legislation have announced their intention to reintroduce the bill in the 81st Congress.

RENT CONTROL: Federal rent controls were continued until March 31, 1949. This means that Congress will have to reconsider this matter during the early part of 1949.

REPRINTED FROM

The Washington Post

Legislative Information

Government by the consent of the governed can be something more than an attractive theory only if the governed are kept apprised of what their Government is doing. The democratic process is a process necessarily involving popular participation in public affairs. And for this, information is an indispensable basis. But it is not easy for people to keep themselves informed about all the acts and contemplated acts of a complex national Government in an era when legislation is looked upon as the panacea for almost all ills. Any instrumentality which aids the ordinary citizen in this regard must be considered a public benefactor.

The Social Legislation Information Service, founded by some 40 leading voluntary organizations in 1944, renders the sort of public benefaction in respect of Federal legislation affecting the general welfare. With severe objectivity, it gives to its subscribers complete but simplified analyses of proposed and pending congressional bills concerning families and communities in the broad areas of health, education, housing, employment, recreation and welfare. The service has proved invaluable to legislators as well as to teachers, social action groups and conscientious individuals. It forges a vital link between Congress and the people.

HOUSING AIDS: Congress passed a bill (Public Law 901) providing the following housing aids:

A $35,000,000 increase in funds for guaranteeing loans on housing costing less than $4,500

A system of guarantees ranging from 95 percent for loans on housing costing below $6,000 to 80 percent for loans on housing costing up to $11,000

An additional $800,000,000 is made available for housing mortgage insurance

A yield insurance program is established which guarantees a minimum return of 2¾ percent on equity investments of rental property for middle income groups

Loan arrangements for prefabricated home manufacturers are liberalized

A new federal unit is established to seek standardization of building codes and building material measurements

Apartment builders receiving FHA insurance on loans are prohibited from discriminating against families with children

Recreation

PARKS AND RECREATIONAL AREAS: Public Law 616 permits states and municipalities to purchase federal real property at 50 percent of the appraised value provided that it will be used as a public park or public recreational area for the benefit of the public.

ATHLETIC AND GAME EQUIPMENT: Public Law 652 authorizes the free distribution to youth-serving groups of approximately $300,000 worth of surplus government property consisting chiefly of such games as checkers, dominoes and parchesi as well as boxing, gymnastic, water polo, volley ball, and bowling equipment.

FEDERAL RECREATION SERVICE: Bills were introduced in both branches of Congress (Senate bill 1229 and House bill 5723) to establish a permanent Office of Recreation Services in the Federal Security Agency to assist the states, their local units, and private organizations in the development of community recreation programs. No active consideration was given to either of these bills.

Veterans' Affairs

VETERANS' ADMINISTRATION: Congress made over $6,000,000.000 available to the Veterans' Administration for its various activities for the fiscal year commencing July 1, 1948. At March 31, 1948, the number of living veterans of all wars was 18,733,000 and the number is still increasing. The following data suggests the scope of the work of the Veterans' Administration:

At March 31, 1948 there were 2,292,683 active pension and compensation cases (running awards). In addition there were 594,821 active compensation cases covering death benefits to survivors of veterans.

A total of 2,432,295 veterans were in education and training programs and 249,176 disabled veterans were receiving vocational rehabilitation.

There were 109,158 patients in Veterans' Administration hospitals and homes. In addition, 13,649 patients of the Veterans' Administration were being treated in other federal, state, and municipal hospitals.

A total of 220,903 individuals received 478,186 medical examinations, and 145,265 persons received medical treatments under the out-patient care program during the month of February 1948.

Dental examinations were authorized during March 1948 to 58,197 veterans, and 60,499 cases were authorized for treatment.

EDUCATION AND TRAINING: Several bills were enacted into law to adjust the scale of subsistence allowances payable to veterans in education or training programs, and to make other changes:

Public Law 411 increased subsistence allowances for student veterans pursuing full-time institutional training.

Public Law 377 included by statute institutional on-farm training among types of full-time training afforded veterans.

Public Law 338 increased the minimum monthly subsistence allowance payable to veterans with service-connected disability (30 percent or more disabled) who are receiving vocational rehabilitation.

Public Law 512 raised the ceilings on earnings and subsistence allowance payable to veterans undergoing a course of education or on-the-job training.

COMPENSATION AND PENSIONS: Congress gave consideration to the impact of increased living costs on veterans' compensation and pension rates, and passed several bills, including the following, to liberalize the rates:

Public Law 877 increased compensation for veterans 60 percent or more disabled by adding additional amounts for their dependents.

Public Law Nos. 270 and 398 provided increases of 20 percent in rates of service pension for veterans (and their dependents) of the Spanish-American War, Civil War, and the Indian Wars.

Public Law 868 increased the rates of compensation for widows and dependents of veterans whose deaths were service-connected.

Public Law 876 increased compensation rates for disability incurred in peacetime service from 75 percent to 80 percent of rates payable for similar disability incurred during wartime service.

DISABLED VETERANS: In addition to liberalizing the compensation rates for disabled veterans, Congress passed several bills, including the following, of special interest to disabled veterans:

Public Law 729 authorized $1,000,000 annually to the Veterans' Administration for research on such prosthetic devices as artificial limbs, trusses, and all forms of orthopedic and sensory devices.

Public Law 702 authorized assistance to "spinal-cord-case" World War II veterans in acquiring specially adapted housing which they require by reason of their service-connected disabilities.

Public Law 785 extended the authority of the Veterans' Administration until June 30, 1949 to provide free automobiles to veterans who lost, or lost the use of a leg, and appropriated $5,000,000 for this purpose.

General Legislation

REORGANIZATION OF FEDERAL AGENCIES: Under the direction of former President Herbert Hoover, a bipartisan commission was established by the 80th Congress to study and prepare plans for the reorganization of the federal government. The commission will submit its recommendations to Congress early next year covering not only structural changes but also recommendations on functions "in the light of their cost, their usefulness, their limitations, and their curtailment or elimination."

DEPARTMENT OF HEALTH, EDUCATION, AND SECURITY: A bill was reported favorably to the Senate to create a Department of Health, Education, and Security to supersede the present Federal Security Agency. The primary purpose of this legislation is to elevate the existing health, education, and public welfare agencies to departmental status under a head with cabinet rank. No further action was taken on this bill partly because it seemed premature to consider this reorganization prior to the submission of a report by the Hoover Commission.

SELECTIVE SERVICE: Public Law 759 establishes a selective service system for the next two years. Men between the ages of 19 and 26 are made liable for training and service unless eligible for exemption or deferment. Provision is made for the temporary deferment of certain students. In general, high school students will be deferred until graduation while college students will be deferred only until the end of the academic year.

DISPLACED PERSONS: The Displaced Persons Act (Public Law 774) was passed to permit the admission of 205,000 displaced persons including 3,000 displaced orphans. The bill also offers an opportunity to 15,000 displaced persons now in this country on a temporary basis to apply for permanent status. It is expected that efforts will be made to have the law amended to liberalize what its critics describe as "restrictive" and "discriminatory" provisions.

Your Subscription is Invited

Use the enclosed card to order a trial subscription for three months for only $2.50—or for a full year at $10, if you prefer. Subscriptions received before the end of 1948 will be marked up to begin in January when Congress reconvenes—but Service will be given FREE for the balance of the year. The subscription fee is a very small investment when you realize that it places at your disposal an expert research and reporting service.

THE SECOND WORLD WAR AGAINST SLUMS

(given at the University of North Carolina,
Chapel Hill, March 12, 1945)

Between the World wars a World-War-Against-Slums really got going. The predominant opinion in America today probably is that such a war has slight chance to clear our slums in the foreseeable future. But "Predominant opinions are generally the opinions of the generation that is vanishing", according to Disraeli, so let's examine the possibilities for ourselves.

First, what was done between wars, abroad and here? Next, what should be done after this war, abroad and here?

Between 1919 and 1935 twelve countries of Europe whose populations total ours rehoused 20,000,000 of their citizens with government aid. We fell far short of 800,000. In other words we were more than 95% behind the times with government aided homes.

Put another way, eight countries of Europe in the ten years 1928-37 built 6,100,000 homes in their urban centers where 123,000,000 people lived.

Had we produced at the same rate we would have built twice as many as we did (3,355,000 versus 1,680,000) in the cities where 69,000,000 of our people lived. Incidentally, more than 37% of the foreign construction was with government aid. Uncle Sam helped less than 3% of ours.

"This achievement should be measured against the 1940 Census findings that in urban areas alone six million families, or 28.5% of all urban families, lived in houses which were a threat to their health and welfare", according to the National Association of Housing Officials. Farm conditions are even worse.

Being so far behind the times maybe we are lucky a war came along. This recess in home building gives us a chance to break with the past, to start fresh, to profit by the facts which have seeped into the heads of our citizens about housing during the twenty year inter-war period.

Among students there is no longer the need to argue the social and economic benefits of decent housing. Perhaps even most of our people will soon accept public housing on an equal basis with public schooling as the British do. In fact England passed compulsory housing before compulsory education laws.

With this more mature citizen-support England naturally went further than we with housing between wars. When I inquired about statistics to prove lower incidence of disease, better morals and less drain on the exchequer in good than bad housing British leaders told me they no longer fussed much with such data. The people now take these benefits for granted, so why bother to continue to prove them.

Summed up, much housing was done abroad between wars, little here. Their citizens were ready, ours weren't. But the political leader today who thinks we haven't caught up

may soon find he is as mistaken as those backward members of Congress who still subscribe to the Cotton Ed Smith School in the belief that's the way to stay in office. The liberal South will not tolerate such Tory misrepresentation much longer. And when it comes to housing the same holds for the balance of our country.

So we can look to what should be done after this war with a bit more optimism. But first, let's see what Europe will be up against.

Frankly, no one knows, but of this I am sure, the extent of destruction as I saw it in London, merely a sample compared with Berlin, is so vast that when rebuilt Europe will be a new world. No longer will those people come to us to see new cities. We will go to them.

Slum after slum has been wiped out. The Whitechapel - Limehouse District of Dickens' days is rubble. John Bull couldn't get the "Limies" to move en masse so John Bull could replace bad with good housing but Hitler did. The displaced people of Europe are so numerous the number can't be calculated. The Leith-Ross Committee and the International Labour Office placed the total between twelve and thirty millions as early as November 10, 1943. The wilder the guess on what has happened since the truer it may be.

Those countries with enough energy left in their civilian economy to devote any to postwar problems are doing something about housing. From Churchill, ".... we had better make a

clean sweep of the areas of which we should be ashamed .... Two hundred thousand sites are already owned" by the government.

A semi-official organ of Britain puts it this way, "And now the first practical steps are being taken in what promises to be the most ambitious housing programme ever undertaken in Britain. The first major job will be to make good the damage of the blitz and the slower but equally destructive ravages of war-time neglect. The second major job will be to catch up with the arrears of a hundred years by providing every family with a separate and generously-designed dwelling, and by establishing an adequate reserve. This second job ought to be completed by the end of the first post-war decade.

Note the provision "providing every family a separate and generously-designed dwelling....by the end of the first post-war decade." Incidentally, that ten year housing program doubles what was done in the twenty years from 1919 to 1939 in England and Wales.

Lord Keynes says the building industry should produce about one-fifth of the national income and that it is the largest single factor in providing employment.

Plans for Sweden and other countries can be examined but Britain probably furnishes our best example as coming from people more like us.

The Prime Minister's caution to "make a clean sweep of the areas of which we should be ashamed" is being taken to heart. In just one area of 197 acres in London, only 9½ acres (about

5%) suffered from blitz but all is to be rebuilt because the remaining 95% was slum.

With American cities the only difference is they haven't been mutilated by bombs. The cancer of decay, or slums, is common to both. So we have the same incentive to follow suit, although we lack the dramatic urge of bombs.

Whether or not we arise to this incentive depends on our leadership. Little will be done if our law-makers listen only to those pressure groups which have been most vocal in the past. Strange to say, this small though loud minority has mistakenly sought at times what was against its own selfish interest. That is unless its selfish interest is to continue to exploit the slum dweller. And I don't believe it is.

An example is the pressure used on Congress to prohibit the conversion of suitable war housing to low rent housing when the war need ends. Instead, public sale was demanded. This throws the projects back into the active rental market. Competition with existing investments ensues. It would be much better for real estate values to turn the jobs over to local housing authorities to shelter slum dwellers who can't pay economic rents.

Congress decided otherwise so unless it corrects its mistakes the crowd that wanted such legislation and got it will soon be creating more competition for itself.

To forestall such mistakes in the future requires a forthright program all our citizens can understand and make

themselves heard about in Washington. It requires men who will speak out as Henry Wallace has spoken out.

Such a forthright program means sixteen million homes in ten years; ten million for the higher income groups, six million for the slum dwellers. No, that won't do the job for us that John Bull plans for his people. But it will more than double employment in our building trades....jobs are our greatest immediate post-war need....while it makes our cities more solvent and raises the standard of living for that 24,000,000 Americans who are ill housed now.

Some folks says it can't be done, that during the next decade we should build two thirds of our housing for a group in which only 10% of the housing is below standard.

How about our Economic Bill of Rights? Why concentrate on the higher income group when among the families which pay less than $10 per month 94% of the housing is deficient, among those who pay $10 to $20 per month 60% of the housing is deficient and among those who pay $20 to $30 per month 25% of the housing is deficient?

Such a proposal puts the cart before the horse. It isn't even good business let alone enlightened sociology. We just can't afford not to tackle slums. They cost more to keep than to clear.

Here are just two examples. Forty per cent of the income of Birmingham, Alabama goes to maintain 11% of the city, its slums. In Indianapolis it costs $27 per capita to service slum districts, $4 per capita to service non-slum districts.

Forgive the statistics while I indulge in just a few more to show that 16,000,000 homes in 10 years is a practical, achievable goal. Let's say we average 1,600,000 a year. One million by private enterprise compares with 937,000 private enterprise did in 1925, so that shouldn't be too difficult.

The 600,000 each year with government help raises the question of how much subsidy. About $105,000,000 a year will do the job. The British split theirs two-thirds from the exchequer, one-third from the local authority. If we reverse that and have cities and states put up two-thirds and Uncle Sam one-third the total annual federal subsidy will be $350,000,000 when all twenty-four million slum dwellers are rehoused. British housing subsidy per annum before the war was over $100,000,000 and Britain has less than one-third of our population. Parenthetically, during the depression we put out well over a hundred million a year to pay rent for people on relief.

Again I apologize for statistics but, you know, we are dealing with facts, not theories.

Some folks say slum clearance must wait until enough low rent dwellings are built on the periphery of cities to house the slum dwellers. If we postpone the redevelopment of our blighted areas that long there is no telling how far the cancer will spread. Even the Italians know slum clearance and rehousing can go forward simultaneously through block by block decanting of families from old into new houses.

Italians have done it. So have the British and other nations, too.

Some folks say that to begin with after the war there will be little building in the blighted areas and in some cities none, claiming even investment money can't flow because slum land prices prevent. That may be true in such places as New York, Chicago or Detroit but where a dollar a square foot is tops as in Atlanta, Indianapolis, and scores of like cities, a Redevelopment Companies Law similar to that of New York State will unleash hundreds of millions of dollars for investment and clear thousands of acres of slums to house white collar workers who can pay economic rents but have a pretty tough time of it now finding decent places to live.

So you see there are many ways to attack the problem. All will help the south. Dr. Odum's "Southern Regions" is such an economic bible for us all and details our deplorable lacks so well I'll not elaborate.

Suffice it to say our southern housing, both rural and urban, has the lowest value, has the fewest facilities and in short is the worst in the nation. We are like the man flat on his back. Any direction is up.

The southern slum was built as minimum shelter for cheap labor. In it labor's health deteriorates below the employable point.

What should we do about all this mess? Should we wet a finger and hold it in the air to find which way the wind blows

as some folks say? Not by a long shot!

We should plow ahead on a realizable, rational program. Many of our leaders both in and out of government have got to get acquainted with another point of view.

They must seek how to do things instead of how not to do them. They must "emphasize the positive and eliminate the negative." They must become leaders in fact as well as in name.

Outstanding among those who are is Henry Wallace. Our housing hope can center in him. And it is good organization that it should because the Department of Commerce can and should be the catalytic element. I do not mean housing should be transferred to Commerce. Housing should continue as a separate agency, of course. What I do mean is that the commercial end of the housing problem is such that once solved many brakes will be off.

There is the complete reorganization of the building industry itself which the Department of Commerce is best equipped to bring about. There is the question of the annual wage which can be worked out by employers and employees together through the Departments of Commerce and Labor. The supply of workers is also a mutual problem just as is the production of materials and of what kind, and cutting out collusion in building codes.

Much will depend on finance. Here the Department of Commerce and the Federal Loan Agencies can help housing. As

Fred Vinson isn't a "Too little and too late man" my bet backs the Wallace-Vinson team to get things done to help see that our war plants and war housing are not exploited by the few but used by the many.

What better outfit to sparkplug industry than Commerce? It can do for business what the Department of Agriculture did for farmers, when awakened by Henry Wallace as its Secretary. Listen to this caution from the Department of Labor, "Unless the situation is changed" (present public and private apathy) "before the end of the war, the most serious obstacle to rapid expansion of the construction industry is likely to be the lack of preparation on the part of owners, including private corporations and public agencies."

Last but not least is Wallace the man. It is he who can arouse our people to back a forthright housing program with voices loud enough to be heard on their farms, in their cities, throughout their states and in Washington.

Thus will the construction industry get going. Thus will jobs be made. Thus will The Second World War Against Slums begin.

A SELECTED LIST OF REFERENCES ON HOUSING FOR NEGROES

CONTENTS

I. Suggested Readings - Books. p.1-3

II. Pamphlets, Bulletins, etc. p.3-8

III. Congressional Hearings. p.8

IV. Periodicals. p.8-15

V. Newspaper articles and reprints. p.15

VI. Theses and dissertations. p.16

VII. Bibliographies. p.16-17

* * * * * * * * * *

This bibliography is arranged alphabetically under the above headings. The Index, p.ii-v, establishes certain subject classifications by item number. The Index is not all-inclusive, but is merely an attempt to guide the reader in his selection of the most pertinent references. For example, classification of items by localities includes only selected material.

The references in general pertain to literature from 1933, when the public housing program was inaugurated, through the first half of August 1945, although a few earlier references are included. Some material is listed which does not deal directly with housing, but which may be found useful in a consideration of the racial factors involved. Special analyses based upon data contained in the United States census are included, but the titles of the relevant volumes are too numerous for listing in this bibliography.

I. SUGGESTED READINGS - BOOKS

1. Bell, Juliet O. and Wilkins, Helen J. INTERRACIAL PRACTICES IN COMMUNITY Y.W.C.A.'s. New York, National board, Young women's christian association, 1944. 116 p.
(Discusses methods and techniques adaptable to community activities in projects.)

2. Bontemps, Arna and Conroy, Jack. THEY SEEK A CITY. New York, Doubleday, Doran & company, inc., 1945. 252 p.
(Describes the four major migratory periods (South to North) of Negroes. Chapters X, XI, XII, XVII, XVIII, and XIX deal with the growth of residential segregation, slums, and other relevant housing factors. East St. Louis, Chicago, Detroit, Philadelphia, Los Angeles and San Francisco are studied.)

3. Davis-DuBois, Rachel. GET TOGETHER AMERICANS: friendly approaches to racial and cultural conflicts through the Neighborhood house festival. New York, Harper & brothers, 1943. 182 p.
(Community activities one answer to racial conflicts.)

4. Drake, St. Clair and Cayton, Horace. BLACK METROPOLIS: A study of Negro life in a northern city. New York, Harcourt Brace and Company, 1945. 848 p.

5. Embree, Edwin R. BROWN AMERICANS: the story of a tenth of the nation. New York, Viking press, 1943. 240 p.
(The history of the Negro, his achievements, the discriminations against him, and his present status.)

6. Ford, James. SLUMS AND HOUSING WITH SPECIAL REFERENCE TO NEW YORK CITY. Cambridge, Harvard University press, 1936. 2 v.
(Discusses history, conditions and policy.)

7. Frazier, E. Franklin. THE NEGRO FAMILY IN THE UNITED STATES. Chicago, University of Chicago press, 1939. 686 p.
("A basic study of the family in its two chief aspects - as a natural, human association and as a social institution subjected to the severest stresses and strains of social change.")

8. Halbert, Blanche, ed. BETTER HOMES MANUAL. Chicago, University of Chicago press, 1931. 781 p.
(Housing developments for Negroes, p. 731-735.)

9. Johnson, Charles S., PATTERNS OF NEGRO SEGREGATION. New York, Harper & brothers, 1943. 332 p.
(Deals with the problems of racial segregation in housing, education, recreation, employment, transportation and public services. Chicago, New York, Baltimore, and Indianapolis are included in this study, which is a part of the Carnegie study of the American Negro.)

10. _____ and associates. TO STEM THIS TIDE: a survey of racial tension areas in the United States. Boston, The Pilgrim press, 1943. 142 p.
(Chapter IV. Race problems in housing, p. 40-61.)

9362

11. Logan, Rayford W., ed. WHAT THE NEGRO WANTS. Chapel Hill, University of North Carolina press, 1944. 352 p.
(Discussions by Negro leaders on racial problems affecting the Negro in America. References to segregation and housing.)

12. Mangum, Charles S., THE LEGAL STATUS OF THE NEGRO. Chapel Hill, University of North Carolina press, 1940. 436 p.
(Chapter V, "Property rights," contains material on segregation in general, segregation ordinances, restrictive limitations contained in deeds and other instruments, and miscellaneous property rights. p. 138-162.)

13. Meyer, Agnes E., JOURNEY THROUGH CHAOS. New York, Harcourt Brace and company, 1943. 388 p.
(Contains a chapter, "Negro housing in the Nation's capitol." p. 322-332.)

14. Murray, Florence, NEGRO HANDBOOK, 1944; a manual of current facts, statistics and general information concerning Negroes in the United States. New York, Current reference publ., 1944. 283 p. bibliography.

15. Myrdal, Gunnar, AN AMERICAN DILEMMA: the Negro problem and modern democracy. New York, Harper & brothers, 1944. 2 v.
(Chapter XV: "Public housing policies", p. 348-53. Chapter XVI: "Housing conditions, p. 375-79. Chapter XXIX, section on "Housing segregation", p. 618-622, section on "Sanctions for residential segregation". p. 622-627.

16. National conference of social work. PROCEEDINGS. New York, Columbia university press, 1940. 736 p.
(Contains address by Robert C. Weaver, "Racial minorities and public housing", p. 289-296.

17. Ottley, Roi, NEW WORLD A-COMING: inside Black America. Boston, Houghton-Mifflin company, 1943. 364 p. bibliography.
(Chapter XII, "The slum shocked", deals with the effects of bad housing. Other references to housing appear in the book.)

18. Pink, Louis H., THE NEW DAY IN HOUSING. New York, John Day company, 1928. 208 p.
(Discusses European projects, and some typical Negro housing projects, such as the Paul Lawrence Dunbar apartments.)

19. President's conference on home building and home ownership. Washington, D. C., 1931. NEGRO HOUSING: report of the Committee on Negro housing, prepared for the Committee by Charles S. Johnson, edited by John M. Gries and James Ford. Washington, D. C., 1932. 282 p. bibliography, p. 260-271.

20. Reid, Ira DeA. IN A MINOR KEY -- Negro youth in story and fact. Washington, D. C., American council on education, 1940. 134 p.
(Chapter III, "No place like home," gives facts on housing.)

9362

21. SOCIAL WORK YEAR BOOK, 1945. New York, Russell Sage foundation, 1945. 619 p.
(Negroes housing problems, p. 284.)

22. Sterner, Richard. THE NEGRO'S SHARE: a study of income, consumption, housing and public assistance. New York, Harper & brothers, 1943. 433 p.
(Chapters IX and X deal with rural and urban housing. conditions among Negroes. Chapter XVIII deals with housing policies. The role played by racial segregation in housing problems of Negroes, and the various patterns of racial occupancy are shown in this study, which is under the sponsorship of the Carnegie corporation of New York. The housing and racial policies of the Federal public housing authority and other housing agencies are evaluated.)

The Economics of Owning vs Renting

WHAT proportion of the people to be served by the housing program now in preparation will be home owners and what proportion will be renters? The answer to this important question does not hinge on attempts to "sell" the consumer on the joys of title possession or to prove that widespread home ownership is a good thing for the nation —however sound these propositions may be. Instead, the answer lies chiefly in economic considerations. For most people the problem of whether to own or to rent is primarily a question of which course, over a period of years, involves the lesser expenditure and the lesser risk.

Both the risk and the expenditure have heretofore made home ownership questionable if not impossible for a considerable part of the population in the lower income brackets. In contrast, those in the upper income brackets—perhaps 5 or 10 per cent of the population in 1940—have an economic status that gives them full liberty of choice. Thus the people to whom the factors of risk and relative expenditure are most important are those in the great mid-section of the economic scale, who in 1940 comprised over half the population. It is their decision that will chiefly determine the course of the housing program in this respect.

SCRAMBLED HAMLET—"TO OWN OR NOT TO OWN . . ."

The importance of that decision to the housing industry and the uncertainties which so many people face in trying to make it prompted the accompanying study of relative costs by Charles E. Young, of the Westinghouse Electric Corporation. His figures and the comments by other participants in the discussion bring to light some interesting factors underlying the problem.

Mr. Young leaves out of consideration the so-called intangibles. But setting up certain assumptions, he strikes a bookkeeping balance that provides some financial guideposts. The gist of his dollars-and-cents conclusions is simply this: for the average family in the mid-section of the economic scale home ownership is warranted *if*—and it is a big if—there is prospect for sufficient family economic stability to justify the added responsibility and to insure occupancy for a long enough period to balance the cost of purchase with the cost of rent.

This conclusion spotlights the need for further effort to overcome two major obstacles to wider home ownership. One is the fact that many would-be buyers, despite a vast increase of the safety factor through the FHA-insured mortgage system, still cannot have sufficient assurance that they will not lose their homes by foreclosure—as did 1,600,000 families in the decade 1926-36. If one grants that home ownership is a desirable goal, it follows that additional measures should be taken to make the mortgage payments more flexible to match the recurrent ups and downs of the economic cycle.

The other is inherent in the economic cycle itself. This may have an effect on home buying even greater than that on other consumer goods because of the long-term commitments involved. Until more people can feel reasonably sure of their jobs there is grave doubt that the proportion of home owners will be much larger than in 1939, when 40.7 per cent of the country's dwelling units were owner-occupied.

NEWS of action now for housing and neighborhood planning

SYMPOSIUM: *Is it more economical, in dollars and cents, to own than to rent a home? What other factors enter into the decision on owning versus renting?*

Should I Own My Home?—A Study of Costs

By CHARLES E. YOUNG
Manager, Statistical Research Department
Westinghouse Electric Corp.
Pittsburgh, Pennsylvania

THERE is no one answer to this question which is right for all people under all circumstances. The following discussion frankly ignores the many intangible aspects of the question, and sets out to do two things:

(1) To compare the cash outlays involved in owning and renting an identical property over varying periods of time, as a basis for gauging the out-of-pocket costs—or savings—of home ownership.

(2) To provide a rough indication of the income required to meet the financial obligations of variously-priced homes without undue strain on the family budget.

Cash Outlays—Owning vs. Renting

The comparative cost of owning or renting an identical house over any given period of time boils down to a comparison between rent payments and the total of the original down payment plus the regular payments for principal, interest and taxes plus the cost of maintenance and insurance.

Because such a great variety of things can and do happen to affect the circumstances under which houses are bought, sold, or rented, and the price at which agreements can be reached, it is necessary to set up some standard assumptions before attempting a comparison of the out-of-pocket costs of owning versus renting for various lengths of time.

First, as to rent, it is a standard and fairly workable assumption that a house will rent for about 1% of its sales value per month.

Second, it is assumed, on the basis of available information, that 3½% of the original cost of a home is a fair annual allowance for taxes, insurance and maintenance expenditures.

Third, it is assumed that the home is purchased with the minimum down payment and maximum mortgage allowable under prewar FHA regulations, plus an allowance for closing costs (property survey, title search, fees, etc.).

Fourth, it is assumed that any sale of the house during the period covered by the table covers only the owner's remaining liability, without either gain or loss on the transfer.

Based on these assumptions, the following tables have been developed:

Price of House:	$4,000	$6,000	$8,000	$10,000
*Owner's Original Outlay**				
Down payment	$ 400	$ 600	$1,600	$ 2,000
Closing Costs	100	125	150	200
Total	$ 500	$ 725	$1,750	$ 2,200
*Owner's Annual Outlay**				
Principal, Interest and Mortgage Insurance	$ 257.64	$ 386.40	$ 516.60	$ 645.84
Taxes, Insurance and Maintenance	140.00	210.00	280.00	350.00
Total	$ 397.64	$ 596.40	$ 796.60	$ 995.84
Renter's Annual Outlay	$ 480.00	$ 720.00	$ 960.00	$ 1,200.00

*Figures for $4,000 and $6,000 homes assume 90%, 25-year, FHA-insured mortgage at 4½% interest plus ½% mortgage insurance fee. For $8,000 and $10,000 homes, assumption is 80%, 20-year FHA-insured mortgage, at 4½% interest plus ½% mortgage insurance.

CASH OUTLAYS INVOLVED IN OWNING AND RENTING

Price of Home:	$4,000	$6,000	$8,000	$10,000
First-year outlay by				
Owner	$ 897.64	$1,321.40	$2,546.60	$ 3,195.84
Renter	480.00	720.00	960.00	1,200.00
Balance favoring renter	$ 417.64	$ 601.40	$1,586.80	$ 1,995.84
Annual saving to owner	$ 82.36	$ 123.60	$ 163.40	$ 204.16
Additional years to "break-even" point	5	5	10	10

On the basis of these assumptions, ownership involves less cash outlay than renting beyond the sixth year on a $4,000 or $6,000 house, and beyond the eleventh year on an $8,000 or $10,000 house. Up to those dates, renting shows a dollar saving which decreases steadily as time passes.

One factor in favor of the home owner not taken into account in these calculations has become increasingly important in recent years. This is the fact that mortgage interest and taxes are deductible from income before taxes. To a man with, say, a $5,000 income buying a $10,000 home, this factor may cut five years from the "break-even" point where it is as advantageous to own as to rent. At lower income levels and house prices it is somewhat less significant, although at current wartime rates and tax exemptions it is of some importance in all the examples listed.

If the owner sells the house before the "break-even" point is reached, he must, of course, receive more than his remaining liability on the house in order to fare as well financially as if he had rented it. Beyond the "break-even" points indicated, he can sell for less than his remaining liability and still be as well off over the entire period as if he had rented.

Matching the Home to the Income

The following discussion is based on the proposition that most family budgets can comfortably devote to total monthly payments for the equivalent of rent (principal, interest, mortgage insurance, taxes, insurance and maintenance), plus the cost of heat and utilities, one-fourth to one-fifth of monthly income. In emergencies, such as relatively short periods of reduced income, it is assumed that these expenses of home ownership and operation can rise to one-third of income without permanent damage to the family's finances, but to continue such a high proportion for any extended period of time would almost surely make the home a severe financial burden. (These proportions are meant to apply particularly to the great majority of families whose annual income is $5,000 or less.)

Rough approximations of these monthly costs in those parts of the United States where the winters are moderately cold are as follows, based on averages:

Price of Home:	$4,000	$6,000	$8,000	$10,000
Owner's Annual Outlay (from preceding table)	$ 397.64	$ 596.40	$ 796.60	$ 995.84
Plus—Heat and Utilities	120.00	140.00	160.00	180.00
Total	$ 517.64	$ 736.40	$ 956.60	$ 1,175.84
Monthly Average	$ 43.14	$ 61.37	$ 79.72	$ 97.99

Translated into terms of income requirements, these figures provide the following pattern:

Price of Home	Monthly Income Desirable Range	Monthly Income Emergency Minimum
$ 4,000	$170—215	$130
6,000	250—300	180
8,000	320—400	240
10,000	375—500	300

The above figures apply to the northeastern and north central regions; they could probably be reduced slightly in the southern and far western regions.

Should I Own My Home?

YES, if—

—you can reasonably expect to live in it for five years or more.

—you can reasonably expect an adequate and sufficiently stable income to meet the costs involved.

—home ownership means enough to you to justify assuming the added responsibilities which it involves.

NO, if the above requirements are not met.

Additional Factors in the Cost Equation

By W. M. BROCK
President, U. S. Savings and Loan League
and
President, Gem City Building and Loan Association, Dayton, Ohio

PEOPLE have been buying homes for several thousand years and they have never based their entire decision, generally speaking, on the dollars and cents involved. The principal motivations for owner occupancy vs. renting derive from the sense of security in owning a piece of property (continuity of occupancy does not depend upon the landlord's whim); the form of investment which property ownership represents (as against bonds, stocks or savings accounts); the independence of action (the living room walls can be painted green without asking permission); and pride of ownership which is a universal and desirable human trait. Mr. Young, of course, does not attempt to analyze the entire background of the home buyer's decision nor does he attempt to measure the dollars which the "amenities" of ownership represent in a very real fashion to those who own. His purpose is merely to discuss the dollars and cents of ownership and he has made a careful, clear and fair analysis of that phase.

There are, however, two or three points in his dollars and cents analysis which have not been covered, and which I feel must be considered if we are to get the overall view.

A portion of the owner's cash outlay is represented by monthly payments on the principal balance of the mortgage loan. While this is an actual cash outlay like the one per cent Social Security tax or payments on life insurance, it also is an investment just as the Social Security payment or the savings account. In other words, when a family pays off its mortgage, it has a substantial reserve for old age or the rainy day. It has a home, which means that it doesn't have to pay rent. In some aspects an investment in a home is not comparable to that of a savings account as it is not liquid but no one can argue that it is not as good an investment from the standpoint of safety, and it does provide a desirable hedge against inflation which a savings account does not (something people are thinking about a lot these days).

Further, Mr. Young's data assume a 90 per cent, 25-year mortgage. Actually, the great majority of homes are today purchased with a substantially smaller mortgage, the average being closer to 70 per cent. This is typical even when pocketbooks are not bulging as they are today. This is frequently balanced by loans short of 25 years which increase the cash outlay during the period of the mortgage but reduce the overall interest cost and achieve almost complete elimination of the major cash outlay for shelter in a shorter space of time.

By assuming that the rent for the house remains stationary, Mr. Young has expressed an average which does not exist. There are advantages of home ownership vs. renting which may be derived from smart buying of a home at the bottom of the 18 to 20-year real estate cycle. In other words, the man who knows when to buy a house, as many do, is in a position to watch other people's cost of rent go up year after year while his own costs are going down. Ownership has the great advantage of freezing that portion of a family's cost of living. Many wish they were in that position today. Ownership has, of course, the opposite side for those buyers who have chosen the wrong year to acquire a home and who make a long term financial commitment at the peak of the real estate cycle. In such cases, the amenities just cost those buyers more.

Further, many of the older but still safe and sanitary houses can be purchased for less than 100 times the gross rent which cuts down the cost of ownership as measured by Mr. Young.

In the second part of Mr. Young's article, he suggests a rough correlation of income to financial obligations which can be incurred for home ownership. His figures are obviously in terms of the larger population centers. Most people, of course, do not live in the large cities and have opportunities to purchase homes at less than $4,000. Of course, they cannot purchase new homes for $4,000 anywhere—yet. The home that a family buys with $100 a month income in the smaller town may be 20 years old. From time to time the faucets may leak which the owner would have to fix himself, and, of course, he would have to mow his own lawn and deprive his children of the "advantages" of supervised playgrounds. He still represents the normal type of home owner in America. In fact, most of the people living in smaller cities and rural communities do not rent. The reason is that they do not have to have the $2,000 a year which Mr. Young suggests as a minimum in order to enjoy these amenities.

Issue Raises Questions of Public Policy

By MERRILL F. KRUGHOFF
Committee on Housing and Welfare, Community Chests and Councils, Inc.
New York, N. Y.

HOUSING affects human well-being. It affects the quality of family life. It is an important element in the personal satisfactions of the individual. No less than other wants and needs of people, good housing involves psychological and emotional as well as economic factors. Mr. Young has frankly ignored these intangible factors, and by doing so has given only a partial answer to the question "Should I own my home?"

Psychological factors in home ownership are of two kinds. First, those which directly affect the financial transactions; second and more important, those which add or subtract values which cannot be stated in dollars. The former were apparently taken into consideration by Mr. Young in making the assumption that the owner will get back none of his equity when he sells the house. While in a perfectly stable market the owner might be expected to recover part of his equity after payment of commissions, it is true that the average person tends to buy in a rising market and to sell in a falling market. Furthermore, the ordinary buyer too often gets caught in the downward spiral of deteriorating neighborhood values. Another justification for Mr. Young's pessimistic assumption is the likelihood that the owner will make expenditures for improvements to house and grounds which he can never recover in a subsequent sale of his home.

People will simply refuse to behave according to cold logic. They ought to have accurate knowledge of the economics of their decisions but they are also perfectly justified in appraising the value of a course of action in terms of human happiness. Experience from Thoreau to the OPA amply demonstrates that people can live far more efficiently, from an economic point of view, than they choose to do. Relief administrators during the recent depression kidded themselves into thinking that they could assure balanced diets for their clients by the simple device of computing the cost of certain cheap foods which would provide adequate nutrition. A Ford Model T is still cheaper to operate than the latest chromium decorated model but manufacturers who try to sell very light "economical" models soon learn better. Likewise, I prefer to live in my own home even though I know it may cost me more than equivalent rented housing. The fact that it will cost more should be known however. Considering the mobility of people and fluctuation of earnings which characterize American life, Mr. Young has rightly shown that it will cost more for a large part of the population.

Two questions of public policy are raised by this discussion. First, should there be broad dissemination of information about the economic factors of home ownership by years of continued residence? Then the home buyer could decide for himself whether home ownership for him is worth the possible extra monthly cost for a specified foreseeable period of stability in residence and earning power. Second, should steps be taken to reduce the loss entailed by the home buyer whose home ownership plan must be terminated in less than five years? The economics of the situation would be sharply altered in favor of the home buyer by lower interest rates, longer mortgages, better city planning.

The Intangibles Are Also Important

By HELEN HOSTETTER
Editor, Journal of Home Economics
American Home Economics Association
Washington, D. C.

MR. Young makes an excellent presentation of the financial questions which the family should consider before venturing into home ownership. His statement, widely publicized, might help to discourage at least some of those who should not take upon themselves this major financial obligation.

But only through grappling with, rather than ignoring, "the many intangible aspects of the question" can the nation avoid a tragic splurge of ill-advised home purchasing in the next decade.

Such writers as John P. Dean, author of "Home Ownership: Is It Sound?" have done us a service in challenging the strong American tradition in favor of home ownership and in pointing out how that tradition is exploited

to our undoing. Wholesome as such writings may be as an antidote for too lush advertising and for the subtler propaganda of many publications and organizations, they may overstate the case.

Housing deeply affects the social and affectional aspects of family life. It can reduce or increase family tensions, facilitate or inhibit self-expression, improve or lower the quality of family living. These truths are self evident. So is it that a rented as well as an owned home can have all these values.

Nevertheless, the cynics to the contrary, certain of the desiderata of family life do seem to be more easily come by when the family owns its house and lot. Such a family is more likely than the renter to be concerned about care and improvement of the property and about the community in which that property is located—about the schools and libraries and parks. Home ownership *which has a sound financial base* most assuredly does tend to increase stability and a sense of security and to provide a better climate for the rearing of children.

Yet we must face the sobering fact that more than a million home owners during the last decade were unable to meet the obligations of home ownership and that more than half of our urban population moved at least once in the five years before 1941, presumably because of change in financial status or occupation. What then for the next five years, during which inflationary pressures will be severe? Doesn't the sensible course of action lie (1) in giving wide publicity to the hazards of home tenure, and (2) in making it safe for a much greater number of families to buy?

That section of the housing bill, S 1592, introduced into the Congress November 11 by Senators Wagner, Ellender, and Taft, which would provide a warranty against faulty home construction and failure to conform with agreed upon specifications and standards is a much needed step in the direction of consumer protection.

Families should have available some impartial agency for counseling on prospective home purchases. Research should reveal ways in which better homes can be secured at lower costs. An America which is capable of the technological advances of the last decade surely has the capacity to remove many of today's obstacles to safe home ownership.

The Industrial Worker's Ownership Problem

By HENRY J. ANDREAS
Industrial Union of Marine and Shipbuilding Workers of America, CIO
Camden, New Jersey

THE question of the advisability and practicability of home ownership is one which must be looked at from many points of view before a true picture can be drawn. The intangible aspects of the question provide the color and tone of that picture.

From the point of view of the industrial worker, home ownership is a highly desired objective regardless of the increased responsibilities that may be entailed. No other investment made by the worker remotely approaches in size, duration and importance his investment in his home.

In home ownership, and in the course of its achievement, the industrial employee develops for himself and for his family a sense of security not to be attained when he rents his dwelling. Other factors being equal, he is free of the threat of eviction because of any sale or transfer of the property and he has a capital investment which can provide, in a few years, a cushion against severe adversity.

A survey of blighted areas in both Urban and Suburban districts will almost invariably show that the blighted properties are not occupied by the owners. This is not presented as conclusive proof that the individual home owner takes better care of his property than either a tenant or an absentee owner, but it does provide an argument in that direction. It can be safely stated that if the majority of homes were owned by the occupants, an efficient brake against rapid spread of blight would exist. A certain pride of ownership is amply demonstrated by a comparison of owner-occupied homes with tenant-occupied homes, especially in suburban communities.

Accepting, for the moment, the possibility of a sufficiently stable income for an industrial worker's family, Mr. Young's comparison of cash outlays graphically indicates a net saving in favor of a home owner within a relatively short period of time. This saving is certainly a strong point supporting the desire for home ownership.

Of the disadvantages which may confront an industrial worker who contemplates home ownership, there is none which presents a greater problem than lack of security in employment. Legislative and other means are being sought by organized labor to meet this need. Housing investment insurance shows a glaring gap in the absence of any guarantee that the final investor—the consumer—can derive from his "investment" the "profits" of peaceful and continued possession during short periods of financial difficulties.

There are other disadvantages, however, which tend to discourage a trend toward home ownership. Substantially large cash down payments, beyond the reach of industrial workers in most cases, present a serious obstacle. If home ownership is desirable from most points of view, monthly payments, made comparable to a rental figure through sufficiently lengthy amortization and low interest rates, provide the only answer to this obstacle. Equally serious is the difficulty of meeting the varying space requirements of the employee's family during the course of the family's career.

Both of the above difficulties have been recognized in a Mutual Ownership Plan developed by the Congress of Industrial Organizations in some Lanham Act war housing developments. Efforts are being made to adapt the plan to conditions peculiar to private investment.

If the question "Should I Own a Home?" is given to industrial workers to answer, the reply will generally be "Yes!" But basic problems remain to be met before home ownership for this group become as practicable and feasible as it is desirable and striven for.

FACTORS IN PLANNING PUBLIC WORKS

An economic background analysis is an important part of the preliminary planning for cities contemplating an extensive program of public works, is the opinion expressed by Dr. Homer Hoyt in a recent issue of the "Journal of the American Institute of Planners."

The purpose of the analysis, Dr. Hoyt explains, is to survey existing trends and plan to improve the economic position of the city by removing obstacles that hinder efficient operation of its industries.

City planners should realize that in carrying out a public works program it is necessary to increase the number of jobs. Thought should therefore be given to plans for industrial districts which would have maximum access to rail, air and water terminals and freedom from local congestion.

Dr. Hoyt believes that attention should also be given by municipal authorities to removing local restrictions of impediments that increase the cost of doing business. He stresses the fact that it may be unwise for local assessors to place unduly high valuations upon land used for industrial purposes as this might result in driving industries out of the city, reducing employment and thereby lowering the values of homes which make up a major part of the tax base.

Similar proposals for the revision of the tax structure of Pennsylvania are contained in a report of the Tax Advisory Committee of Harrisburg, Pa., to the Joint State Government Commission.

The recommendations include:

1. Removal of existing inequities and discriminations in present tax structure.
2. Making the state more attractive for expansion of business and industry and new capital enterprises.
3. Relieving the present high local tax burden on real estate.
4. Stimulating and encouraging conversion of "distressed areas" which are fast becoming depleted of their natural resources, to a more healthy and diversified industrial basis.

HOUSING AUTHORITY AIDS CITY WITH TAXES, FORECLOSURES

Real estate with an assessed valuation of $5,356,500 has been acquired by the Boston Housing Authority through the right of eminent domain, information released by the Authority reveals. During these takings it purchased from the city $96,560 of city foreclosed properties, and delinquent taxes in the sum of $248,527 were recovered by the city at the time of the sales.

The real estate tax levied by the city on the properties acquired by the Authority, calculated on the basis of the tax rate for the year of acquisition, amounted to $214,379. For the fiscal year ending March 31, 1945 tax payments of the Authority to the City of Boston amounted to $400,124. This sum is $185,745 in excess of the tax charges by the city on these areas at the time of acquisition.

The Authority calculates tax payments according to the following three methods: ten percent of shelter rent, net profit or ad valorem.

MINIMUM PHYSICAL STANDARDS AND CRITERIA

FOR THE PLANNING AND DESIGN OF FPHA-AIDED URBAN LOW-RENT HOUSING

NOVEMBER 1945

NATIONAL HOUSING AGENCY
FEDERAL PUBLIC HOUSING AUTHORITY
Philip M. Klutznick, Commissioner

12-45

FOREWORD

Shelter is a recognized essential of human existence. Persons acquainted with the needs of the American people are agreed that, second only to providing useful and remunerative jobs for all workers, provision of good housing for everyone is one of the imperatives of the postwar period in this country. Filling the housing needs of the American people clearly involves a public responsibility which must be met by government action.

Our CIO Post-war Housing Program recommends that plans be based on meeting an estimated need for 1,750,000 new homes every year for a period of ten to twenty years. It proposes that private enterprise be challenged to do as much of this total as it can, but that public and cooperative housing make up any deficit, however great.

The CIO is naturally interested in the general welfare at stake in the development of a strong, efficient, and stable housing industry which will contribute its full potential toward the achievement of decent housing for all Americans and the stability of our national economy at the level yielding full employment. In addition, the CIO since its inception has taken an active interest in the problem of providing housing for its membership, which of course includes Negroes and other minorities who face disproportionate difficulties in securing decent housing.

The critical housing problem facing Negroes requires accurate definition, wider understanding of its real nature, and the marshaling of concerted action for its solution. To this end, representatives of several national organizations[1] were called together by the American Council on Race Relations. They have been meeting from time to time during 1945 to devise an effective action blueprint which should have wide application, especially, in urban centers. That this group has been successful in achieving agreement on definition of the problem and the most essential areas of action is both unprecedented and encouraging.

Publication of this action blueprint in the present bulletin has been assumed jointly by the National CIO Committee to Abolish Discrimination and the CIO Committee on Housing and Community Development. This publication is offered as a contribution toward

[1] American Council on Race Relations, National Association for the Advancement of Colored People, National CIO Committee to Abolish Discrimination, National Council of Negro Women, National Negro Congress, National Negro Newspapers Publishers Association, National Urban League.

achieving wider understanding of the real nature of a most difficult and neglected problem in housing and stimulating wider support for sound and concerted action in housing, particularly, as concerns meeting the needs of minorities. To fill the additional need for a guide to immediate action in facing critical problems of war housing disposition which will, in many cases, involve disporportionate impacts upon minority groups, the original blueprint has been supplemented in the present bulletin with a special section on "Disposition of War Housing." This section is based largely upon two excellent pamphlets on the subject: the first by the National Urban League, and the second by the National Housing Agency.

Finally, an obvious but decisive test of any soundly conceived and successfully operated housing program is its efficacy in supplying standard housing to accommodate the family size and income of Negroes, which is admittedly among the most difficult, as well as neglected, of all housing problems. In our opinion, this bulletin presents an accurate definition of the basic factors underlying the disproportionate difficulties that Negroes face in securing good housing and outlines sound and practical steps to fundamental solution of this urgent part of the total housing job. It is, therefore, of the utmost importance to a successful housing program that the contents of this bulletin be adopted as a basic guide to action in the housing field by all organizations who can agree with our national goal of good homes for all the American people.

James B. Carey,
Secretary-Treasurer, National CIO; Chairman, National CIO Committee to Abolish Discrimination.

R. J. Thomas,
President, United Automobile Workers —CIO; Chairman, CIO Committee on Housing and Community Development.

George L-P Weaver,
Director, National CIO Committee to Abolish Discrimination.

William G. Nicholas,
Director, CIO Committee on Housing and Community Development.

December 1945

DEFINITION OF THE PROBLEM

The particular problem of supplying standard housing for Negroes is part of the total problem of providing suitable accommodations in well-planned neighborhoods at rates which the various income groups can afford to pay. The distinctive difficulty lies in the arbitrary limitation of land area available for occupancy by Negroes. Consequently, the provision of added living space and suitable housing accommodations for Negroes represents the most difficult aspect of the housing problem of the community. Organizations concerned primarily with Negroes' status in the nation should direct their attention to the accurate delienation of these needs and the development of programs and techniques to meet them.

Negroes need more living space, more housing units, and better-planned homes and neighborhoods.

The present housing problems facing minorities (especially Negroes in the North and West) are basically the same as those of the post World War I period, and will persits as long as large numbers of our citizens are forced to live in ghettos.

An increasing number of Negroes are recognized as potential buyers and renters of privately financed housing.

Despite this fact, because most Negroes are in the low-income groups, a larger segment of the Negro population will be forced to remain in substandard homes unless there is a program of public housing.

To date, the only significant contribution toward establishing new, well-planned housing adapted to the family size and income of Negroes, and located in well-planned and attractive neighborhoods, has been in public housing projects. Negroes, however, look with apprehension at the trend toward expanding segregation as a result of the general insistence upon "Negro" projects. At the same time, they question unwarranted attacks upon public housing by the proponents of private housing since they know that public housing has brought them real and enduring benefits while private housing has seldom afforded them new or suitable dwelling accommodations.

Negroes welcome the wartime interest of private builders and real estate agencies in developing new housing for colored occupancy and hope for its continuance in the post-war period. At the same time, they want to know specifically the nature and extent of construction private enterprise is prepared to undertake.

The customary approach of private enterprise has been to meet

the housing needs of Negroes by allowing them to inherit old and deteriorated "hand-me-down" properties; this practice has resulted in the apparent association of the spread of blight with race, instead of with the real underlying economic factors. It is recognized that a limited measure of the housing need of Negroes and other low-income groups may be met and the spread of blight retarded by the effective rehabilitation of sound structures, providing the resulting dwelling units are well adapted to family size and income.

Most groups new to city living have been relegated to the slums and restricted areas as a first step in their urbanization. Individuals of higher incomes have moved into new and better and usually unsegregated neighborhoods as they have progressed economically and culturally. The real estate boards, the home builders, the building and loan associations, and the mortgage investors, have been the instruments through which these results have been achieved for non-colored peoples. Negroes also expect and will constantly press for similar types of services and the expansion of living space from these same interests which have recently expressed a concern in developing housing for Negroes.

There can be no real solution to the housing problems of Negroes (which assume critical proportions each time there is large-scale migration) until individual Negro Americans, as other individuals, find decent housing in desirable areas outside of established or newly created ghettos. At the same time, as long as Negroes are restricted to limited areas, the supply of land available to them will seldom equal the demand. In periods of sizable increases in population there will be extreme overcrowding and excessive prices; even well-kept sections within the ghetto will be endangered and often depressed. Racial tensions mount under such conditions.

The recent announcements of the National Association of Real Estate Boards, the National Association of Home Builders and other private building and financing interests indicate that such agencies are concerned with establishing the fact that private enterprise can house the entire population, including Negroes. Now is the time to define desirable conditions of such housing under private enterprise and present them to the agencies which are wooing support, including that of Negroes.

PROGRAM OF ACTION

Action on the Federal Level re Private Housing

Negotiations with the National Housing Agency and the Federal Housing Administration should be held to achieve the following:

1. Revision of policies and procedures of NHA and FHA so as to permit and facilitate ready insurance of loans to Negroes who are good risks in terms of accepted economic standards.
2. Establishment of administrative machinery to see that Negroes participate freely in benefits of FHA insurance—as individual home-owners and as occupants of multiple unit rental projects.
3. In order to accomplish these basic requirements the following action is needed.
   a. Impartial application to Negroes, as to all other borrowers, of such occupancy standards as financial status, credit rating, record of property maintenance, etc., as the basis for FHA insurance and abandonment of the practice of restricting FHA insurance for eligible Negro borrowers to properties in areas already occupied by Negroes.
   b. Collection, analysis, and dissemination of information to representatives of private builders, real estate boards, home financing interests and the general public regarding the quantitative and qualitative deficit in housing accommodations, the need for opening additional space to Negro occupancy, the effect of Negro occupancy upon property values (this would require an objective and comprehensive factual study of such things as the initial and long-run income from property occupied by Negroes, a study of Negroes as financial risks, and their record in maintaining property and meeting financial obligations incident to the purchase and rental of housing), the social and economic costs both to the family and the community of restrictions upon living space available to Negroes, and the successful experience in meeting the problems of housing which face Negroes.
   c. Institution within the NHA and FHA administrative structure of machinery and competent personnel specifically charged to assist the agencies in carrying out (a) and (b), and to affect NHA and FHA policy and procedure in such manner as to secure equitable participation of Negroes in all phases of the programs. The experience of the race relations personnel in the Federal Public Housing Authority is pertinent.

Action re Private Building Interests

A. Negotiations with national agencies representing private builders, real estate boards, and home financing interests should be held to ascertain the following:

1. What these agencies are prepared to do in providing an adequate supply of housing available to Negro occupancy and what proportion of the Negroes' need they can and will supply, where the housing will be located, and at what rents and sales prices and for what family sizes.
2. What these agencies are prepared to do toward opening new and unsegregated areas to Negroes.
3. What standards of home and neighborhood development they are prepared to foster.

B. On the basis of these findings, responsible organizations should develop and circulate an evaluation of the place, responsibility and possibilities of private enterprise to meet the housing needs of Negroes. Continuous pressure should then be applied to induce private builders to meet these responsibilities through providing adequate space and accommodations.

Action re State Legislation

Organizations should develop an analysis of existing and pending state legislation for housing and urban redevelopment, with special emphasis upon their potential danger for spreading or strengthening residential segregation and the necessity for mandatory provisions of standard housing for families of the same economic and racial groups as those displaced by redevelopment projects.

Action on the Local Level re Private Housing

On the basis of the findings developed by national organizations, local organizations should inquire into and seek to influence the nature of private housing in their locality.

In order to accomplish this they will have to take the following steps:

1. Confer with regional and local offices of the National Housing Agency and the Federal Housing Administration.
2. Confer with local home builders, real estate boards, mortgage investors, and saving and loan associations.
3. Press for an equitable share of new and desirable units.
4. Inform the community of the long-run implications of the type of planning which conditions the new housing, indicating its influence upon the ultimate supply of housing for Negro occupancy and its influence upon extending or reducing residential segregation.

Action on the Local Level re Private and Public Housing

There are certain actions on the local level which are related both to private and public housing. The following are the most important:

1. There must be a well-organized and effective group of local citizens constantly insisting upon meeting the housing needs of the entire population, and these needs should be defined in terms of income, family size, and local housing requirements.
2. This group should agree and declare what part of the need can be met by private housing and what part will require public housing, in order to assure an adequate supply of standard housing available to the various income groups.
3. This group should define and publicize what is involved in home-ownership and when such ownership is economically possible and desirable.
4. This group should serve to interpret to the community how the local housing agencies are organized and operated.

Those agencies concerned specifically with the needs of Negroes should, of course, be active participants in the citizens' housing and planning organizations. In addition, they should:

1. Press at the **local level** for well-planned, integrated housing developments which will serve all racial groups;
2. Demand and secure adequate municipal services in areas where Negroes live;
3. Report to national organizations and initiate local protests in instances where federal public agencies support or encourage an extension of segregation in housing;
4. Support local housing and planning agencies when and where they propose or initiate sound programs for site selection and housing developments;
5. In both public and private housing in the post-war period, the local government will be called upon to supply certain services and utilities. Since the cost of these city services is borne by **all** citizens in the final analysis, Negroes should insist that they be supplied only when the housing needs of Negroes, too, are being met and when the proposed housing makes a contribution towards opening new and unsegregated living areas.

Action re Public Housing

It must be realized that the extreme concentration of control of public housing in the Federal Government has been a temporary

wartime phenomenon. In the post-war period the initiative, planning and operation for such programs will be primarily on the local levels. Despite this current shift in administrative controls, the federal agencies have a responsibility to assure equitable participation of all groups in all phases of a federally-aided program. They will discharge this responsibility adequately only if effective organizations continue to press for such action, nationally as well as locally.

Action at the Federal Level re Public Housing

A. National organizations should evaluate continually the policies and procedures of the federal and regional offices of public housing agencies in light of their efficacy in:

1. Providing equitable housing facilities for Negroes;
2. Making additional areas available to occupancy by Negroes in these communities where lack of space has resulted in overcrowding and high densities;
3. Collecting and disseminating experience with unsegregated occupancy patterns in public housing projects in various sections of the country.
4. Pressing for the establishment of unsegregated housing patterns in the programs of local housing authorities in localities where state or local law requires unsegregated public facilities such as schools, or where, in the absence of such law, custom has established unsegregated use;
5. Effecting equitable employment of qualified Negroes in all phases and at all levels of the program.

B. National organizations must constantly press for action by federal agencies to encourage local housing authorities to develop their programs in accordance with the policies outlined in A above.

Action at the Local Level re Public Housing

Since the primary control of public housing projects is in the hands of local housing authorities, local organizations must maintain constant contact with local housing and planning agencies and exert their influence to obtain at the local level the objectives which the national organizations have pressed for on the federal level, as well as those outlined in the previous sections on local action.

Action re Race Restrictive Covenants

Restrictive covenants based on race, one of the principal means of limiting the space available to Negroes, can and must be fought

on four fronts—the courts, sources of publicity, legislation, and through economic action.

1. The fight in the courts is of long standing. While good cases should be pressed, there is danger that poorly chosen or poorly presented cases may occasion costly, adverse legal decisions. Competent legal authority should define the issue and local groups should urge lawyers to guard against unsound action.

2. Race restrictive covenants—and more particularly, restriction of all Negroes to the ghetto—are economically and socially unsound, as well as morally wrong. The facts on the incidence and effects of race restrictive covenants can and should be assembled and disseminated. From them three specific (and in nowise unrelated) results can follow:

   a. Community organizations and agencies can condemn race restrictive covenants (as has recently and effectively been done in Chicago).

   b. The action outlined above and the dissemination of the facts can and will lead to public discussion and newspaper publicity on the problem.

   c. Legislation barring future race restrictive covenants can be introduced (which in itself leads to more discussion and publicity) and enacted.

3. In most cities there is vacant land not now covered by such covenants. Local organizations should concentrate upon encouraging the development of attractive, well-planned housing and neighborhoods open to occupancy by Negroes on these sites. The most desirable development is that which is available to all racial groups, which has adequate community facilities, and is planned to house several income groups.

DISPOSITION OF WAR HOUSING

(In preparation of this section, the National CIO Committee to Abolish Discrimination and the CIO Committee on Housing and Community Development leaned very heavily upon the experiences and materials prepared by the National Urban Leagne. Special commendation is due the National Urban League for recognizing over the years that shelter is a recognized essential to human existence. This recognition is implemented by the establishment of a Housing Bureau within the structure of the national office of the Urban League, which always has been ready to assist labor and other citizen groups in the improvement of housing conditions.)

The end of World War II makes imminent the disposition of war housing which will, in most instances, have disproportionate impacts upon minorities where they are included among the occupants. Excluding conversions and stop-gap accommodations, over 73,000

public war housing units are occupied by Negroes in 408 projects located in 165 localities throughout the country. About 25,000 of these are permanent family units. In addition, Negroes occupy about 12,000 permanent family units of war housing produced with private funds. Thus, it is clear that Negro citizens, whose unmet housing needs are admittedly excessive, have a vital stake in the disposal of war housing.

The National Housing Agency, which is responsible for disposition of war housing under the Lanham Act, has designated its constituent, the Federal Public Housing Authority, to carry out the disposal function for all housing determined surplus by the NHA Administrator.

Under the war housing program, more than 1,900,000 housing units were produced for war workers and their families. More than half of this total were financed with private funds, mostly through Title VI FHA insurance, and form a permanent addition to the Nation's housing supply, with over 800,000 of the units new construction. The rest were financed and, for the most part, are owned by the Federal Government, with over 600,000 of the units new construction. The bulk of this public housing is of temporary construction and cannot be used indefinitely for residential purposes.

But disposition is not a simple matter of the Government's selling all the war housing it can and demolishing the rest. Disposition policies and procedures are governed by the Lanham Act and the Surplus Property Administration regulations. People are still living in temporary war housing projects who must be housed elsewhere before their homes can be torn down. Local communities should be consulted; undue disruption of local housing markets and the lives of individual families should be avoided; and the impact of disposition on the country's housing supply should be carefully weighed community by community.

Excluding additional units that may be transferred to it, the FPHA has approximately 654,000 war housing units that must be disposed of as soon as they become surplus to the needs of reconversion and orderly mobilization. About 320,000 are **temporary** family and dormitory units unsuited for long-term use as housing. About 180,000 units are of **permanent** construction, including some 106,000 standard permanent units, and about 74,000 demountables which can be used permanently on present sites or transferred to new locations. Another 60,000 permanent family units, built with U. S. Housing Act funds, will revert to low-rent public housing use. The remaining stock includes about 35,000 trailers, which will be disposed of as they become surplus, and about 56,000 conversion

units, under lease arrangements, which will revert to the original owners.

Temporary war housing, according to the Lanham Act, must be removed as promptly as possible when it is no longer needed on its present site. Removal of the 35,000 trailers, and 320,000 family and dormitory units, including the 50,000 occupied by Negroes, is mandatory not later than two years after the end of the emergency. The only exceptions will be instances in which the National Housing Administrator, in consultation with the local community, finds that specific housing is still needed for orderly demobilization. All such exceptions must be periodically reviewed and reported to Congress.

There is, of course, the danger that many communities, which wish to exert pressure to force migrants (particularly minority group migrants) back home, will not press for a time extension until additional permanent housing is produced, but, rather, will urge removal of temporary housing as a means of forcing certain groups to move out.

While there is always a danger that temporary housing will become slums of the future, its removal should be so timed as to be a part of an over-all approach to the community plan for meeting its housing problem. Temporary housing may offer transitional shelter for those displaced in slum clearance, or it may house migrants until permanent units can be completed.

Permanent war housing, according to the Lanham Act, with the exception of projects financed under the U. S. Housing Act, must be sold "as expeditiously as possible" to occupants or other private purchasers unless transferred or sold to other Federal agencies or to state or local governments. These projects may be sold to local housing authorities for low-rent use where suitable and the community officially requests it and the Congress approves. They include 106,000 standard permanent units and 74,000 demountables, of which about 12,000 are occupied by Negroes.

It is important that pressure be put upon local housing authorities to request and justify the purchase of all Lanhan Act permanent war housing projects that are suitable for long-run public housing use. Where such sales are not effected, present regulations establish certain preferences. These should be learned and made available to the Negro community. One important provision is that sales can be made to mutual ownership corporations, provided membership is such as to assure immediate occupancy by members of at least two-thirds of the dwelling units comprising the project or the portion thereof sold. Where it is possible or feasible to dispose of

a project to occupants or prospective occupants, projects or portions thereof may be sold to private investors.

The mutual ownership plan, which provides for purchase of permanent war projects by occupants who have organized a non-profit mutual corporation, is best suited to middle-income families. By the pooling of their individual resources, such families will be able to minimize the risks incident to home ownership. Here, again, the first need is to make as wide a segment of those eligible to participate aware of their opportunities as possible. Labor organizations, consumer cooperatives, and tenant associations are the community organizations which should spearhead mutual ownership plans.

Care should be taken to see that where private investors acquire war housing projects they should not be permitted to purchase these properties for speculative purposes.

Finally, there are also the 60,000 low-rent housing units built for war use which will revert to local housing authorities. It is important to find out which of the present occupants are eligible to remain in these units and see that occupancy plans are developed to retain them and to include additional Negro families in these and other permanent public war housing units.

Action on the Local Level re Temporary War Housing

1. Find out what local officials plan to recommend to federal government relative to disposition of temporary public war housing.
2. Where such housing is needed to shelter dislocated families of former war workers, veterans and servicemen during the period of demobilization and reconversion, urge local officials to delay recommendation of its termination.
3. Encourage use of such housing for rehousing occupants of slum dwellings while permanent housing is being constructed.
4. Where there is no immediate pressing need for such housing in your community, encourage residents of nearby small towns or rural areas to take steps to secure the structures.

Action on the Local Level re Low-Rent Housing Converted to War Use

1. Find out if local housing authority is prepared to take projects over promptly and urge and facilitate such action.
2. Work out plans for equitable participation by minority groups in the reconverted low-rent projects.

3. Urge unsegregated occupancy of such reconverted projects and cooperate with local housing authority in effecting it.

Action on the Local Level re Lanham Act Permanent Units

1. Urge local housing authority to file applications for public purchase of all projects suitable for long-term housing use.
2. Learn and distribute information about occupancy priority on units sold.
3. Investigate mutual ownership corporations.
   a. Work directly through FPHA in Washington in order to establish what projects in your community are eligible or suitable for the mutual ownership plan.
   b. If any are eligible, devise program (with cooperation of local authority) to acquaint and interest present occupants in that plan.
      (1) Be sure tenants have necessary stability of income to justify home ownership.
      (2) Start action now so that groups will be organized and prepared to act when units are available for sale.
      (3) Do not over-simplify or "over-sell" groups on the plan.
4. Investigate proposed sales to private investors, with special attention to the possibilities of speculation purchases.
   a. Sales prices between private investor and government should establish ceilings on re-sale prices and rentals.

Action on Federal Level

1. Press federal agencies (NHA, FPHA, OPA, OES, OWMR) and congressional representatives for contractual stipulations of rental and resale price ceilings on Lanham Act housing disposed of to private enterprise or persons.
2. Press for stipulations forbidding the application of race restrictive covenants to any Lanham Act properties transferred to private investors.
3. Demand that the conditions of sales involving private investors be made public at the time of the transaction.

Action on Local Level re FHA-Aided War Housing

1. The availability of such housing through default of payments should be made common knowledge in your community.
2. Local groups should negotiate with FHA to see that these homes are made available to all in accordance with need and financial status and without regard to race, creed or color.

To Speed Up the Housing Program

ON December 4 the National Committee on Housing made public a series of recommendations (presented on pages 2 and 3 of this issue) which called for sweeping changes in the veterans' emergency housing program. The proposals were aimed at pulling the housing effort out of the doldrums. They were drafted by a broadly representative special committee and were the outgrowth of the National Committee's Housing Inventory and Forecast Conference held in Chicago November 19-21, which brought together 400 leaders in the various fields concerned with housing.

The recommendations sought the achievement of three goals: (1) an end to those restrictions which under present conditions hamper the veterans' program and the housing effort in general; (2) immediate enactment of new measures to spur rental housing for moderate and lower income families —the kind of housing in greatest demand; (3) early enactment of long-range housing legislation. The proposals are based on the fact that the veterans' program has failed to meet the present critical need for shelter, despite good intentions in Washington.

Ten days after the Committee made its proposals, President Truman announced a new government policy on housing. It calls for liberalization of various controls heretofore in effect and seeks to clear away the obstacles that have hampered full use of men, materials and money to create new dwelling space.

In many respects the new Presidential policy parallels the recommendations previously made by the National Committee. There are, however, a few rather important differences. The chief similarities and differences are highlighted in the following comparisons.

Price and rental ceilings on newly constructed housing: For more than a year the National Committee has advocated removal of OPA ceilings on new construction in the belief that they have tended to check the production of housing.

The President removed the $10,000 NHA ceiling price on houses for sale. He continued that agency's rental ceiling of $80 per unit with the modification that it may be applied as an average, covering all of the units in a given project, and continued the OPA control over the rents to be charged.

Limitation of floor areas! To insure completion of the maximum number of dwelling units from available materials and labor, the Committee recommended, in place of price and rental ceilings, a limitation of the size of the individual units.

The President's program includes such area limitations.

Rental Housing: The Committee placed special emphasis on the construction of apartments for rent to veterans in the middle and lower income brackets. It proposed income tax incentives to stimulate moderate-priced rental housing. For the low-income veteran's family, which under present costs cannot be served, legislation was urged to enable local housing authorities to provide 100,000 dwelling units for this type of occupancy.

The President emphasized that new rental housing would be the primary goal next year and promised that construction of rental projects would be aided by financial measures.

Veterans' priorities: The Committee recommended that veterans' preference be retained on rental units but abandoned on new homes for sale.

The President said that the preferences should be continued on both types of housing.

Non-residential construction: To prevent diversion of materials and labor from housing, the Committee recommended that restrictions on deferrable, non-residential construction be continued.

The President said the order limiting non-residential construction should be continued temporarily, but added that the increasing need for schools and other community facilities in new developments must be met.

How well the Government's newly announced program will work remains to be seen. Two of its provisions in particular are open to question. One is retention of a modified $80 ceiling on new rental units. At present cost levels this may continue to retard rental housing construction in the high cost metropolitan centers where it is most needed. The other is the apparent aim to ease controls on non-residential building. This raises the question of whether it would not have been wiser to wait until the supply of materials and labor is larger.

Far more important than these or any other details is the question of what action Congress will take to facilitate building moderate and low rent housing—and when. Beyond any doubt the need centers primarily in these two areas; implementing legislation is essential; and it rests with Congress to act in time to get a large scale program under way in the coming building season.

NCH Recommendations on Veteran's Housing

Report Called for Major Changes; Cited Need For Apartments

THE present emergency housing situation is a magnified expression of a long-term problem. It highlights that problem. Because of its urgency it demands immediate and bold action capable of producing homes with speed.

The National Committee on Housing has just concluded a Housing Inventory and Forecast Conference in which it reviewed the many factors pertinent both to the present critical situation and to the future. Following this Conference, the undersigned committee formulated recommendations to meet the present emergency. These recommendations are set forth below and have been approved by the Executive Committee of the National Committee on Housing.

The needs of the moment are so manifest that the Committee has concentrated upon measures to cope with the continuing crisis. in housing; it has not attempted to re-appraise the extent of that crisis.

The veterans' housing demand, similar to the normal demand for housing, falls into three categories: the demand for higher-cost homes for those who can afford them; the demand for medium-cost homes for families with middle incomes; and the demand for low-rent homes for those with limited earnings.

The recommendations here made are designed to meet the needs of these three groups during this acute emergency and in the years to come. These objectives require an immediate emergency program and the initiation of a program for long-range planning. The immediate program requires legislative implementation which should command and retain the attention of the forthcoming Congress until enacted.

Recommendations

Restrictions and Controls On the Use of Available Materials and Labor

Price and rental ceilings on new construction have proved unrealistic and ineffective and have checked the construction of greatly needed multi-family housing. Therefore such ceilings should be lifted.

Available materials and labor must be used to provide the largest possible number of completed dwelling units. As a more effective implementation of this purpose it is recommended that consideration be given to establishing a permissible maximum usable floor area for all new dwelling unit construction. For individual single family houses, for example, a limitation of 2,000 square feet might be the permissible maximum. For multi-family rental housing (apartments) the permissible maximum might be 1,500 square feet, the comparable equivalent usable area. Since multi-family housing makes use of common services and service areas, adequate apartments are normally designed in somewhat less space. By limiting the amount of permissible area, available supplies of basic construction materials and of labor will be conserved, even though it may be possible to use luxury fittings and adornments. Such materials are not competitive with materials required in the general housing field.

Veterans' Preference

Removing restrictions on owner-occupant and individual for sale houses is recommended for the reason that (1) the present preference to veterans is largely ineffective insofar as serving the needs of the great mass of veterans is concerned; (2) that this preference for veterans has served to limit the production of such housing since the operative builder is unwilling or unable because of capital investment required, to proceed with a large-scale program unless sales can be made rapidly during construction. The requirement that such houses must be held for at least 30 days after completion for sale to veterans only results in most builders deferring undertaking additional construction until sales have been consummated. (3) Since a great proportion of veterans desire to rent rather than to purchase houses, the preference on multi-family rental housing should be continued.

Unlike the builder of single family houses for sale, the builder of multi-family housing is not dependent for his permanent financing on the sale or rental of the structure on completion. The fact that veterans are given preference in rental housing therefore would not defer additional construction since in this type of building, rentals can be made at any time.

Aids to Stimulate Emergency Rental Housing

New rental housing construction differs from building for home ownership in that a single project to be efficient must usually be large in scale. The investor in such an enterprise must look for his return to the rental income produced by the property during its lifetime rather than to its sale in the market. Under present conditions in which the current costs of construction seem unduly high and in fact are still rising, few investors will commit their funds to new large-scale rental projects. Although current rental prospects promise full occupancy during the years immediately ahead with consequent favorable returns, prospective investors fear that this early favorable experience will be more than wiped out by the competition of a lower level of construction costs after the housing emergency is over.

To meet this situation and to encourage the construction of large-scale rental housing projects by private enterprise during the next two years, the Committee recommends the following proposal for serious consideration: Authorize the Commissioner of Internal Revenue, on the initiative of the FHA, to issue certificates of necessity to qualified corporate investors in large-scale rental housing projects on which construction is begun prior to January 1, 1949. Such certificates should be issued only when the need for housing in the locality chosen is demonstrated and promises to continue. The project would be required to meet FHA requirements with respect to the soundness of the financial set-up and should carry rental schedules calculated to meet the needs of the middle income group for rental housing. Such projects holding a certificate of necessity would be permitted to take depreciation up to a maximum of 20% in any one year for the next five years, provided that any such sums taken for depreciation were concurrently applied to the reduction of the indebtedness on the property and provided also, that at no time during the period may indebtedness against the property exceed its depreciated book value.

The Committee considers this method of encouraging private enterprise construction of large-scale rental housing projects better suited to meet the conditions of the times than the proposal that the RFC Mortgage Company take second mortgages on such properties up to 100% of current costs. The latter proposal suffers from two defects. On the one hand, necessity for clearing a proposed project with two different government agencies would entail delays in construction. On the other hand, any proposal for 100% financing of private risks is open to possible abuse. The Committee's alternative recommendation would permit present high construction costs to be written off during the early years of the project when its rental returns are most promising. At the end of that period the project would be able to continue to compete in the rental market with new construction. The fact that the indebtedness against the property would be amortized concurrently with the depreciation in book value would tend to eliminate one of the worst overhangs that has customarily followed periods of high residential costs, namely the pressure of an outstanding volume of indebtedness that bears no relation to the reduction of value.

The Committee suggests that with this plan in effect, the FHA might find it prudent to insure rental housing projects up to 90% of their current construction costs under Title VI.

This proposal involves only a minimum possible subsidy from the government. Depreciation can be taken by an owner only once, either during the early life of the property, or spread over its full life. In view of the expected decline in construction costs, depreciation should properly fall heavily in the early years as is proposed by the Committee. Even if such a decline should not materialize, the Treasury will ultimately stand to lose very little in taxes, the exact sum depending for the most part, on the amount by which corporate income tax rates were reduced in the future.

This is a specific recommendation limited

to projects undertaken before January 1, 1949, under Title VI of FHA. It has no bearing on the Committee's long term corporate income tax recommendations embodied in the Committee's forthcoming study of the effect of corporate income tax on rental housing by Randolph Paul and Miles Colean.

Housing for Veterans of Low Income

Because of the high cost of construction at this time, emergency provisions are necessary to meet the housing needs of the families of veterans of low income as well as the families of veterans in the middle and higher income brackets.

The Committee recommends that special legislation be enacted immediately to provide assistance to local housing authorities to finance for veterans of low income 100,000 dwelling units under this program. The resulting public housing should be restricted to veterans and the legislation should contain essential safeguards as to income-rental relationships.

Postponement of Deferrable Construction

The Committee recommends that deferrable non-residential construction be postponed until it is apparent that the availability of materials and labor insures clearly that such construction will not result in undue competition in the locality with residential construction.

The Committee recommends that the general contractors, operative builders and building trades labor set up committees to expedite the housing programs in the locality. It shall be the job of a committee to determine the number of residential units required and of the construction committee to ascertain the number of workmen and the amount of materials required to satisfy that need. It shall be the job of the contractors' committee to find extra labor in areas where there is an oversupply of construction labor, and it shall be the job of the Expediter's office to keep track of extra supply of labor in various parts of the country. It shall also be the job of the local contractors' committee to find out what materials are in short supply and to report those items to the Expediter's office in Washington. The emphasis must be on the largest number of completions rather than merely starts.

In the case of such non-residential construction as is permitted, it should be clearly apparent in the community that there is labor available after housing commitments are made and undue pressure will not be put on the national pool of materials.

Temporary Shelter

Critical materials and needed labor should not be used to produce new temporary units. Such units utilize a great proportion of the amount of critical material, labor and construction time consumed in the building of permanent units. Temporary construction is costly. That expense and the materials and labor should be devoted to permanent construction.

Sale and Rent Control

The Committee reaffirms the position taken by the National Committee on Housing in September 1945 against rent or sale price control on new construction, but favors the continuance of rent control on existing houses. In view, however, of the increased costs prevailing, it seems evident that some adjustment in rentals should be considered at this time. The Committee therefore recommends that an immediate analysis be made to determine the extent of the needed adjustments and to determine also whether such adjustments should be made on a locality, regional, national, or other basis.

Experiments in Prefabrication

We urge all branches of the government to give to all types of builders in the housing field every available help with the thought that those demonstrating the greatest ability to produce, shall receive the greatest consideration both as to material and labor.

Experience has shown that while pre-fabrication is promising, it requires complex and time-consuming manufacturing processes. The present attempt to balloon the use of prefabricating methods by preferential treatment for new companies, new processes and new materials as an answer to the housing problem for 1947 is to gamble with national reserves of scarce materials. This siphoning off of essential materials may seriously impair other sections of the national economy.

It is particularly important not to pyramid the use of scarce materials which already constitute crucial bottlenecks in other major durable goods industries. The ability to maintain high level employment by transferring labor from soft goods industries to durable goods industries during 1947 will depend to a considerable extent, upon the availability of these critical materials. For example, if the automobile industry is crippled for lack of materials, the resulting mass unemployment would upset the entire economy, and with it, the remedying of the housing problem as well.

Long-Range Housing Legislation

The Committee has recommended an emergency program which will need certain legislative implementation. We trust that Congress will recognize the importance of the housing emergency and consider and act upon this legislation within the first two weeks of its session.

It is also important that the Congress give immediate attention to the long-range housing problems of this nation. We have for too long a time had to meet emergency upon emergency in this field. At its last session, Congress considered, and the Senate passed, the Wagner-Ellender-Taft Bill. We urge early enactment of legislation to effect an over-all housing program. Such a program after enactment will take several years of careful planning at local, regional, and national levels to develop. But unless the machinery is set in motion now to permit such planning, effective results will be needlessly delayed. Enactment of such legislation for long-time planning need not and must not interfere in any way with the prompt prosecution of construction under the Emergency Housing Program.

At the time of the hearings on the Wagner-Ellender-Taft Bill, the National Committee on Housing pointed out certain inflationary and uneconomic provisions. We feel that the passage of time has added weight to these objections, and the congressional committees which will review the new legislation should give consideration to appropriate changes.

Farm Housing

It is essential that we recognize the magnitude and the importance of the problem of adequate housing for farm families. Since the house is an integral part of the farm economy, efforts to improve farm housing must be coupled with efforts to improve the economic base of the farm where needed to support adequate housing. Any program for farm housing must be directed toward making available to farm families the services and aids which have been provided for urban dwellers.

Housing for Minority Groups

Simply to increase the volume of construction for various income groups does not assure a comparable increase in the supply of shelter for colored minorities. This follows because builders have usually neglected this market and because racial restrictions on land occasion serious site difficulties.

The Committee recommends that:

1. FHA encourage the construction of housing available to minority groups.
2. FHA cease to require the enforcement or to encourage the use of race restrictive housing covenants.
3. FHA, in the case of 90% insured loans, require that an equitable proportion of rental housing be made available to qualified colored occupants.
4. Municipalities face honestly and act effectively to meet the space problem of minorities and start to break down ghetto living.
5. Public housing reestablish the pre-war trend of meeting the needs of minorities equitably.

Respectfully submitted,

Fred H. Ludwig, *Chairman*

Basis for Report Laid in National Conference

THE National Committee's three-day Housing Inventory and Forecast Conference held in Chicago in November was designed to be a town meeting, on a nation-wide scale to consider the present and the future of the housing program. The purpose was first to take stock of the veterans' emergency program, spearhead of the housing effort, then to consider housing prospects in general. It was essentially a means of evaluating the results of past planning against recent changes in the economic situation that have had profound effect both on the need for and the production of dwelling space.

The Conference was a truly representative gathering. Among the 400 who attended were leaders of all the varied interests concerned with housing—civic, constructional, financial, building materials, labor, technical, consumer and government. Some sixty top-ranking speakers took part. Many others joined in the informal discussions.

Out of this exchange of views came conclusions that were later embodied in the National Committee's recommendations. From the Chicago meeting came a clarification of ideas on how to make the veterans' program more effective and pave the way for a housing program commensurate with the urgent needs for rental space, particularly by middle and low income groups.

To achieve perspective on the whole problem, future as well as present, the Conference program was divided into two major sections. One dealt with the veterans' housing program to date. The other dealt with the question of where Housing goes from here. Under the first section were five panel discussions, entitled: (1) "What's Been Built—and How?"; (2) "The Veteran Pays—Housing Costs and Prices"; (3) "Can or Should the Veteran Wait?"; (4) "Can the Builders Build?", and (5) "The Outlook for Materials and Labor". Under the second section were panel discussions entitled: (1) "Urban Market and Need"; (2) "Farm Market and Need"; (3) "Building Better Neighborhoods and Communities", and (4) "An Over-all Housing Program".

A special dinner meeting of the Conference was addressed by His Eminence Francis Cardinal Spellman, Archbishop of New York, who called on the nation to pay its debt to its war veterans, and Norman E. Wates, Chairman of the British engineering and construction firm of Wates, Ltd., and Treasurer of the British Federation of Registered Home Builders, who described Britain's post-war housing program.

Housing For Veterans

The keynote of the discussion concerning veterans' needs was sounded by Mrs. Samuel I. Rosenman, Chairman of the National Committee, who said that the problem is now one of pushing building in the greatest possible volume and pushing it at cost levels that the average veteran can afford. She added that the National Committee has long been convinced that the greatest opportunity for meeting the average veteran's housing needs and desires—the provision of multi-family rental housing—has been left almost untouched.

Succeeding speakers described the difficulties that have beset the program and the results attained to date. The concensus was that the present failure is due in large part to the attempt to provide a big volume of housing at low cost against the handicap of rising prices and to the emphasis put on homes for sale. Reports from all sections indicated that the great majority of veterans who need housing want to rent rather than buy. Most of them cannot afford the homes now being built and do so only to get a roof over their heads. The result is that instead of helping the veteran as the nation intended, he is being made to absorb the present inflation in housing costs.

The extent to which the veteran is paying was discussed by several speakers. The general conclusion was that the veteran is paying too much for too little. It was also agreed that the demand by veterans for space is likely to keep prices up. This is indicated by the estimate that four million returned GI's want to rent or build within the next twelve months and that one million of them are willing to buy at current prices. In view of the situation it was suggested that the veterans' problem is part of the general housing problem that calls for solid, long-range solutions, in which the provision of rental housing at prices within reach of those who chiefly need it must be undertaken.

The Outlook

On the question of whether veterans can or should wait for housing, the opinion was expressed that it is time for truth telling about the facts of housing. As one speaker put it, the veterans should not have to wait, cannot wait, but must wait. It was pointed out that a substantial proportion of the houses built in 1947 will be sold to others than veterans, simply because the average veteran cannot afford to buy them. Eighty-five per cent of the veterans cannot afford to pay more than $6,000 for a home, and most of them cannot afford to pay more than $45 a month for rent. Again, there was the inescapable conclusion that low-cost rental units must be provided.

Whether builders can build under present conditions was the subject discussed by several well known practicing builders. Their conclusions were that builders could build if certain obstacles were removed. High on the list of obstacles is the continuing shortage of materials, particularly of key materials the lack of which slows completions. Others criticized government controls. Some advocated a "free market" for new homes at current prices on the theory that non-veterans who can afford such homes would, by occupying them, release rental quarters for veterans.

The outlook for materials and labor brought to the fore the opinion, as expressed by several speakers, that material shortages are gradually being overcome but that the flow of materials is still unbalanced.

Housing in the Future

Most of the speakers who dealt with the problem of long-range housing needs voiced the opinion that much of the housing now being built or projected will simply renew present evils. One pessimist thought that much is now being done to promote future financial discouragement for home owners, abandonment of properties and substantial losses to Government agencies and mortgage finance institutions. Another believed that under present conditions housing is built for the market and distributed according to ability to pay rather than according to need. Others, more optimistic, believed that when the present crisis is over a more stable housing program can be undertaken. The general opinion was that much remains to be done before a real start can be made on meeting the basic housing needs of the majority of the American people, urban and rural.

An important problem in this connection is the building of better neighborhoods. This subject was the theme of a number of speakers who hoped that the widespread recognition of the need for more adequate community planning will result in more attention to this phase of development.

The final series of discussions dealt with the problems involved in an over-all housing program. Here, much of the criticism that has been leveled at present standards was brought to a focus. Suggested remedies for present ills included drastic overhaul of housing finance, adoption of new methods of production, and complete revamping of present building codes. The outstanding contribution in this section of the Conference was the clear recognition of the fact that all elements in the housing picture must work together to provide adequate living space within the reach of the average family.

Off to a Good Start

NO VOLUNTARY act of citizens ever promised to bring more credit on Orlando than the proposal, now practically certain of accomplishment in a business-like way, to enlarge and improve the residential section for negroes.

Headed by a group of able citizens, the undertaking will be guided and financed in such a way that ultimately all funds and costs will come out of the property itself and there will be no profits for promoters and speculators.

When the tract is accepted into the zoning plan of the city, it will be laid out with streets and parks, paving and sidewalks will be put down, sewerage will be constructed, sanitation will be established and all the other requirements of a decent neighborhood.

All these costs will be computed into the reckoning and the lots will then be sold to negroes without profit and on terms suited to their incomes, either as bare property or equipped with the buildings desired by the prospective tenants.

★ ★ ★

WE KNOW THAT looking at the undertaking before it is begun, it appears singularly simple and free from difficulties, but there will be many snarls to iron out and problems to solve before the affair is started.

But the absence of the profit feature leads us to believe those in charge will perform according to their best judgment and successfully ward off those who will try to make undue profit from the outside.

As many know, because negro property is limited, both rents and prices are exorbitant in areas restricted to their use, another condition it is hoped to correct by destroying the monopoly in negro real estate.

We repeat that we are aware that many troubles will confront those undertaking this fine project, but Orlando Morning Sentinel will be right in there helping to overcome them and help all concerned to hew to the line.

"to attack the social evils of the slums and to provide decent living quarters..."

RECEIVED
APR 20 1946
Southern Regional Council

LOW-RENT HOUSING

NATIONAL HOUSING AGENCY · FEDERAL PUBLIC HOUSING AUTHORITY

LOW-RENT HOUSING

"There is no immediate aim of the American people," a Senate committee unanimously declared in 1937 after 3 years of investigation, "more widely supported and more insistently voiced than the desire to attack the social evils of the slums and to provide decent living quarters . . ."

The reasons were clear. Evidence in every city, and in most of the towns and farm areas, had demonstrated the acute need for a program to rehouse low-income families who could not afford to pay for decent housing. Ten million families—the one-third of the Nation referred to by the late President Roosevelt—were ill-housed. A tremendous challenge confronted private housing industry and the Government.

In August 1945, in the closing days of the war, a special subcommittee of the Senate reaffirmed those earlier findings. After reviewing the Nation's housing supply and postwar needs, the subcommittee stated: "Every family must have a decent home in which to live . . . Slums are not only a deterrent to the development of a sound citizenry, but they lower the people's desire for healthful and attractive surroundings and the hope of improving their conditions."

The slums have been indicted on a dozen counts:

To doctors and public health officers they represent the plague spots of tuberculosis, pneumonia, and other preventable contagions; areas where the death rate is highest, particularly among new-born infants.

To police forces and social welfare agencies, they appear as a generating source of juvenile crime and moral delinquency. To local fire departments, they outline the firetrap zone, where fires are most frequent and hardest to check. In the fiscal terms of city officials, slums are the areas of low tax revenues and high expenditures for police and fire protection.

THE PEOPLE VERSUS *the slums*

To businessmen, slums are a swamp where building activity stagnates. The high cost of slum land makes slum clearance and rebuilding on slum sites an unprofitable venture for private enterprise.

To housewives and mothers, who must spend most of their time at home, slums represent dismal, insanitary workshops where cooking, laundering, and child-rearing are carried on in conditions that State industrial hygiene codes would not tolerate in a factory.

To owners of homes and other property, they are a financial menace. A slum neighborhood tends to spread a creeping blight that impairs the value of nearby property, and that threatens property values throughout the city.

All these groups and many others have spoken out for a program to tear down slums and rehouse the families in new homes built for decent, healthful living. It has been shown that such a program cuts down the cost of municipal services and protects property values. It also means good business—particularly for the cement, lumber, steel, glass, and other building materials industries, for private contractors and construction workers who do the actual building job, and for private investors, whose capital can be put to work profitably in housing project bonds.

LOW RENT BECOMES LAW

For reasons like these, Congress in 1937 passed the United States Housing Act. Before America entered the war and had to put aside further expansion of low-rent housing, this act along with companion laws in 39 States, launched a Nation-wide attack on the slums. Under its provisions, nearly 200 communities razed slums and built 334 low-rent housing projects. From shabby, rat-infested city tenements, and to a lesser extent from shacks on the countryside, nearly 106,000 low-income families moved into decent homes at rents they could afford to pay.

When the war began, only half of the authorized program had been completed. More than 11,000 dwelling units, under construction at that time, were completed to house war workers, and will be turned back to the use of low-income families after the war. Additional war housing projects, making use of remaining low-rent funds, were authorized by legislation supplementing the U. S. Housing Act; the 53,000 dwelling units under this legislation will also become low-rent housing after the war. In areas not requiring more war housing, the construction of another 24,000 planned low-rent dwellings was deferred.

Before the surrender of Japan, work began on more than a thousand of these, to help relieve housing shortages in congested areas. After VJ-day local housing authorities were notified that they could prepare to resume construction of other deferred low-rent housing as soon as materials became available.

Added up, the total program thus means the rescue of 194,000 low-income families from the drabness and filth of slums—concrete evidence that action can be taken against the slums to produce tangible results.

THE FEDERAL GOVERNMENT HELPS, BUT THE COMMUNITY DOES THE JOB

To administer the low-rent program, Congress set up a Federal agency, the United States Housing Authority. Its functions, along with the public war housing functions of other Federal agencies, were transferred in February 1942 to the Federal Public Housing Authority, set up by Executive order as a constituent of the National Housing Agency.

As far as low-rent housing is concerned, the powers of FPHA are strictly limited. It cannot go into a city or town to tear down slums or build new housing. It cannot even award contracts to have these jobs done by others. Under the U. S. Housing Act, the decision on whether a specific locality should clear slums and build a low-rent project is the business of the people who live in that locality. If, through their local governing

body, they decide that low-rent housing should be built, owned, and managed in their community, all these functions are performed by a group of local people. This group, called the local housing authority, is generally appointed under State law by the mayor or governing body, and serves without pay. Its members (usually five) cannot be selected or dismissed by FPHA, or draw a Federal salary.

The locality, working through its local authority, can get several types of help from FPHA.

LOANS. To raise the money needed to build a low-rent housing project, the local authority may borrow up to 90 percent of the development cost from FPHA, which has been authorized to lend a maximum of 800 million dollars for this purpose. Such loans must be fully repaid, over a period of no more than 60 years, together with interest that usually runs from 2½ to 3 percent.

ANNUAL SUBSIDY. Most of the cost of providing low-rent housing—including management expenses, repayment of the development loans with interest, maintenance, repairs, insurance, and so on—is borne by the tenants themselves. But the rents that low-income families can afford to pay do not cover the full cost. Part of the deficit is made good by FPHA through a yearly subsidy, called the annual contribution, which is appropriated by the Congress. The amount varies from year to year, depending on the amount needed to keep the rentals within the tenants' reach, but for the total program it cannot run over 28 million dollars in any one year. The most that can be paid to any local authority for a year's operation is limited to a percentage of the project development cost equal to the going Federal interest rate plus 1 percent. For example, on a $500,000 project with a percentage fixed at 3½ percent, the top Federal contribution in any one year would be $17,500.

TECHNICAL ADVICE. FPHA has a staff of technicians, in Washington and in its regional offices, familiar with housing law, architecture, construction, management, and other housing aspects. The local authority may draw freely upon their experience and knowledge. However, so long as it meets prescribed minimum standards, it has complete leeway to write its own ticket on the site to be utilized, the style of architecture, type of building materials, and similar matters.

THE LOCAL AUTHORITY MUST MEET CERTAIN LEGAL REQUIREMENTS

In order to qualify for loans and annual contributions, local authorities must, of course, observe the basic requirements that Congress wrote into the U. S. Housing Act to make sure that the money would be spent to lift low-income families out of the slums. These are the things the local authority is required to do:

PROVE that the locality needs public low-rent housing

The local authority, by a survey or other means, must first get the facts about local housing conditions—the extent of bad housing, the rent levels that slum dwellers can afford to pay, the lowest rents at which private developers can supply decent housing, and so on. To guard against any possibility that public low-rent housing might compete with private home building, FPHA requires the local authority to admit only families well below the income level necessary to pay the lowest rents charged in the locality for decent private dwellings.

RAISE part of the project development cost from private capital

To insure that the project is on a sound financial basis and is locally acceptable, the authority must obtain at least 10 percent of the development cost from non-Federal sources, generally by selling bonds to private investors. This requirement has been met with ease. Actually, local authority bonds have been so well accepted in financial circles that more than one-third of the capital cost, of projects on which long-term financial arrangements have been made, has been loaned by private investors. Thus, instead of having to lend the 90 percent contemplated by the U. S. Housing Act, FPHA has put up less than two-thirds. Since the act went into operation, private investors have increased their share of the financing every year. In a number of cases private funds account for 85 percent of the total financing, and in New York City recently, private capital financed a project 100 percent.

OBTAIN local contributions to help assure low rents

At least one-fifth of the annual subsidy paid by FPHA must be matched by a local contribution. Both the U. S. Housing Act and the State laws permit the localities to make their contribution by exempting low-rent projects from taxation, and this has invariably been the method used to meet this requirement. So that the low-rent tenants and project may bear part of the community's tax burden, local authorities make annual service payments, generally known as payments in lieu of taxes, up to 10 percent of shelter rent. Such payments must not exceed full taxes or reduce the local contribution below one-fifth of the Federal contribution, but they are often greater than the taxes formerly collected on the slum property. In 1944, low-rent projects paid an average of $17.76 per dwelling unit, or a total of nearly $1,900,000. Because of war incomes and large rent revenues, the 1944 payments were above normal.

ELIMINATE one slum unit for every new dwelling unit built

Where a project is built on a slum site, clearance of slums is automatic, since the old structures must be torn down to make way for the new. But local authorities are required to eliminate slums even if the new project is built on vacant land. Somewhere in the locality it must arrange for an equal number of unfit dwellings to be demolished, brought up to decent standards by compulsory repair, or closed up. By the end of June 1945, local authorities had brought about the elimination of 105,000 substandard dwellings, as against 117,000 on which elimination could be legally required at this time. However, the act provides that elimination of substandard units may be postponed in localities with an acute housing shortage. The small remainder has accordingly been deferred in order to prevent dangerous overcrowding.

BUILD and operate the projects economically

Local authorities are not permitted to run above a dwelling facilities cost of $5,000 per unit in large cities, or $4,000 in smaller cities. (Dwelling facilities cost excludes the cost of land, nondwelling facilities, and slum demolition.) This requirement compels them to practice strict economy in construction, and to forego any features smacking of luxury. Actual costs of dwelling facilities have been kept well below the limits, averaging $3,782 in the larger cities, and $3,328 in the smaller ones. The local authority, it should be mentioned, does not do the actual construction job itself, but awards the job to private contractors on the basis of competitive bids.

THE LOCAL AUTHORITY MUST MEET CERTAIN LEGAL REQUIREMENTS—Contd.

RESTRICT the project to eligible families

The local authority must see that every family admitted to a low-rent project meets three basic requirements of eligibility:

1. The family must be living in a substandard dwelling. (This requirement is waived for returning veterans, many of whom lack accommodations of any kind.)

2. The family head—the person who signs the lease—must be an American citizen.

3. The family income must be below the level needed to obtain adequate, privately owned housing. Under the U. S. Housing Act, the net family income of applicants may not be more than five times the gross rent (the rent charged by the project, plus the estimated cost of any utilities not covered in the rent). The net income of families with three or more minor dependents may not exceed six times the gross rent. The top rent must be less than the minimum rent for decent privately owned dwellings.

Local authorities have generally adopted a system of grading rents to income. An eligible family is assigned the size dwelling unit it needs, and is charged the maximum rent it can afford. To comply with the spirit of the U. S. Housing Act on a continuing basis, FPHA requires local authorities to conduct a reexamination of tenant family incomes once a year, so that if the family incomes have changed, rents may be adjusted to bring them in line with the income limitations. For example, a three-person family that moved in with a net income of $60 a month, would pay a gross rent of at least $12; if a subsequent reexamination showed that its income had increased to $70 a month, the gross rent would be raised to at least $14. The graded rent system, along with the policy of adjusting rents to income, accounts for a feature of low-rent housing that has sometimes puzzled observers—the phenomenon of two families paying different rents for identical dwelling units. The explanation is that each is paying as much as it can afford, and the dwelling unit of each is being subsidized no more than necessary.

Families whose incomes increase above the top limit are not eligible to continue to live in the project, and are given notice to move. In normal times, when accommodations are available on the private market, enforcement of this policy does not create a difficult problem. The difficulty during wartime has been that the booming war production areas where incomes have gone up most sharply are usually areas of acute housing shortage.

Where no other dwellings are available, it is, of course, not practicable to compel the over-income family to vacate immediately. Its rent is raised to the maximum so that it will not be subsidized, but the family is temporarily allowed to remain in the project while intensive efforts are made to find other accommodations.

HOW MUCH DOES LOW-RENT HOUSING COST THE FEDERAL GOVERNMENT?

Some people have the mistaken idea that the Federal Government pays the full cost of the low-rent program. They take the average cost of building a dwelling unit, multiply it by the total number of units, add in the cost of operation and come out with a large sum of money. Then they assume that all this represents expense to the Government.

The arithmetic may be right, but the assumptions are wrong. The lion's share of this total cost is covered by the rents that low-income families are able to pay. The initial

cost of building the projects—the total development cost—is not charged to the Government. Local housing authorities borrow a large part of it from private investors, and are regularly paying it back. The rest is borrowed from the Government, and this debt (along with interest) is also being paid off in full.

The only cost to the Federal Government is the pay-as-you-go annual subsidy. The Federal contribution makes it possible for local authorities to operate the projects and repay their capital debt with interest—and still keep rents within the means of low-income families.

In recent years, operating economies and improved tenant incomes have kept the subsidies well below the legal maximum. During the war, contributions were low because of war incomes, but normally they can be expected to be higher. Contributions required to maintain low rents in 1944 totaled $8,600,000, only $7.19 per dwelling unit per month and about three-fifths of the full amount permitted by law. Through December 1944, the Government had paid annual contributions totaling less than $38,800,000. This is the total Federal cost of clearing the slums and rehousing the families since the projects first went into operation.

THE COST TO THE COMMUNITY—AND THE BENEFITS

While the Federal Government puts up part of the yearly housing cost, the local community, improved by slum removal and a more adequate supply of good housing, is also expected to bear part of the cost. The U. S. Housing Act requires the locality to match at least one-fifth of the Federal contribution. State housing laws make this feasible by permitting the projects to be exempt from local taxes—a method authorized by the Federal act.

Figured at its maximum, the cost of low-rent housing to the city or town is the amount of tax exemption, less the payments made in lieu of taxes. The net exemption, though not paid in cash, is a real contribution. For example, in 1944, the local contribution covered 15 percent of the total cost of operating the housing. (In comparison, the Federal subsidy took care of 20 percent, and rents paid for the remaining 65 percent.) Thus, tax exemption covers a substantial part of the housing cost. If projects were required to pay full taxes, rents would have to be increased beyond the reach of low-income families, thereby defeating the purpose of the law. Thus, a community cannot participate in the slum clearance and low-rent program without sharing in the cost.

The community, however, does receive real value for the contribution it makes toward good housing. Slum properties are usually poor taxpayers. Taxes assessed are often delinquent. Slums pay less in taxes, and cost the city more in upkeep, than other areas. In Boston a survey showed that the city's deficit from a slum area was $48.24 per person; from all other residential areas the average deficit was only $10.81. Unless the community grants tax exemption for a proposed low-rent project, the project cannot be built, and the low-revenue slums remain.

The drain of slums on local treasuries has been demonstrated in all parts of the country. Atlanta, Ga., for example, reported in 1941 that its slum area paid 5½ percent of the city's real property tax revenues, but cost the city 53 percent of its police, fire, health, and other service costs. By reducing the frequency of fires, disease, accidents, crime, and juvenile delinquency, the replacement of slums by good housing cuts the cost of services furnished by the city government.

Finally, slum clearance increases a city's income by increasing the value—and hence the tax revenues—of neighboring property.

But a community's basic asset is not its property but its people. On the average, families rescued from slums and rehoused in decent surroundings are healthier, more efficient workers, better citizens. As the Senate subcommittee declared in August 1945, "a supply of good housing, sufficient to meet the needs of all families, is essential to a sound and stable democracy."

A COMMUNITY'S BEST ASSET IS ITS *people*

Housing & Crime

When the residences of Houston children known to the Crime Prevention Division were plotted on a map of the city, they assumed a certain characteristic distribution. ~~(Map 1).~~ There was a heavy concentration in and around the central business section, with the numbers decreasing towards the edge of the city. When rates were computed for individual census tracts on the basis of the number of children residing in them the pattern was more clearly revealed. ~~(Map 2).~~ The rates for individual tracts varied greatly, the lowest rate for a single tract being 24.5 per 1,000 children with the highest being 342.2 per 1,000 children. The tract with the highest rate had fourteen times as many arrested children living in it as the tract with the lowest. Arrested children were found throughout the city, but they were much more heavily concentrated in the areas of low socio-economic status.

Housing in Relation to Juvenile Delinquency

The close relationship between substandard housing and delinquency has been apparent in Jacksonville as elsewhere and is one of the most potent reasons for further slum clearance in Negro sections.

An interview with the Superintendent of the Negro Boys' Parental Home, 1245 Jessie Street, developed the fact only seven boys have been referred to the Home from either of the Housing Areas in the nine years since Durkeeville was first opened to tenants. At present, there is only one boy in the Home whose family lives in a housing project.

A similar interview with the Superintendent of the Negro Girls' Parental Home, 1918 Jefferson Street, reveals that in the three years this has been operating, no girl has been referred to the Home whose family lives in the Housing areas.

In 1942, February, when Blodgett Homes was opened, it was known that the surrounding slum, "Hansontown", had been the outstanding crime center in Jacksonville. Arrests had been 2,000 per square mile in Hansontown as against 210 in the rest of the city.

Modernizing Building Codes

EFFORTS are under way both in this country and in England to revise and standardize building codes. In the United States the effort centers on the preparation of a new basic code by the Building Officials Conference of America and on the development of certain general standards under the auspices of the American Standards Association. In England a special committee sponsored by the government and aided by various experts is engaged in drawing up a new code of building standards along the lines described in the following articles by Colin Lucas of the British Commonwealth Scientific Office in New York.

DON'T FENCE US IN

In examining the methods and the objectives of the two endeavors it is well to remember the original purpose of building codes. As with so many of the regulations society has adopted, building codes grew out of the need for community measures to insure safety of construction. But because of the many variants involved progress was not uniform. The gradual growth of building codes as we now know them was conditioned on the one hand by local habits and on the other by the lag between technical advances in construction and man's disinclination to change established methods of building.

To the objective of safety has been added in more recent years the protection of health as an essential factor in building codes. Among the complicating factors, the most important perhaps, is the widening gap between technical advances and traditional building practices. Prefabrication is one example. Others include the possibility of using lighter, less expensive framing and sheathing materials to lessen the cost of housing.

It is this situation which has called forth the greatest controversies over the revision of building codes. Most codes are admittedly antiquated in that they make little provision for the use of so-called experimental methods and materials. Those who desire sweeping changes charge that vested interests—including some trade unions as well as some suppliers of building materials—are blocking progress by obstructing the revision of codes. From the other camp come charges that the proponents of change want to lower the all-important safety factor and throw the field open to all sorts of untested experiments. However, most unbiased observers agree on the need for setting up general performance standards as a basis for modernizing local regulations.

In this effort it is interesting to note the differences between the British and American approaches to the problem. The British are working toward a standard of performance supported by good practice which in itself would have no legal force, though evidently intended as a model for local enactments. In contrast, most American revisionists think in terms of code changes based on enforced minimum standards. Apart from this, however, the two projects have much in common, and the guiding rules suggested by Mr. Lucas will undoubtedly meet with general approval in this country.

SYMPOSIUM: *To what extent is the English method of preparing building codes, as described here, applicable to the drawing of a basic code in the United States?*

Preparation of Building Codes in England

By COLIN LUCAS
British Commonwealth
Scientific Office
New York

I HAVE been asked to write something about the work we are doing in England on Building Codes. Although we are tackling the Code problem in rather a different way than you are here, it may for this very reason be interesting to hear about it.

The preparation of Building Codes in England is in the hands of a Committee. (The Codes of Practice Committee, for civil engineering, public works and building) which was formed in 1942. This Committee is undertaking the task of preparing a Code, which will cover the whole field of practice in civil engineering, public works, building and constructional work. Unlike Codes in this country, this English Code is not a legal one, it is simply a "statement of good practice" by the profession, written independently of existing bylaws (codes) or acts.

The Code is being written by the professional and technical institutions, with the assistance of the Department of Scientific and Industrial Research. The Committee, although sponsored by the Government, is extra-governmental in its membership, which consists of nominees of the professional and technical institutions, the British Standards Institution and the Building Industries National Council, with assessor members nominated by certain Government Departments, and a Chairman appointed by the Minister of Works.

A small group of technical men was chosen to draw up the form of the Building Code, and after considerable discussion a skeleton framework was created, which has since been followed with very little variation. The preparation of this framework provided some interesting problems in the classification of subject matter, and the conclusions reached by the group who worked on it, and the form which they finally adopted may be of some interest to those who are working on similar problems in this country.

Functional Aspects

In order to make a clear distinction between *performance standards* and *specific techniques,* the code was divided into two parts—a "Code of Functional Requirements", which deals with the standards of performance required for buildings and parts of buildings, and a "General Series" of Codes dealing with specific materials and methods.

The Code of Functional Requirements consists of eleven chapters, dealing with light and air, space, noise, fire, loading, weather protection, services, heating, heat insulation, corrosion, dirt and vermin, and acoustics. All these subjects are dealt with in terms of design data, i.e., the standards are expressed in U. values, daylight contours, foot candles, phons, lbs. per sq. ft., and so on. They form the basis for the recommendations given in the General Series Codes, which deal with all the materials and components used in buildings.

The General Series Codes are divided into three main headings: (1) *Carcase,* covering foundations, superstructure, walls, floors, roofs, etc., (2) *Finishes,* covering painting, plastering, floor coverings, etc., and (3) *Installations,* covering sanitation, drainage, water supply, electricity, gas, etc., and mechanical equipment. The Codes are so arranged that each subject is dealt with first in general terms, in a master code of the series, and then broken down into sub-headings. By this arrangement each master Code has beneath it a "family tree" of sub-codes, dealing each in more detail with the subject. In most cases three or four levels of sub-codes are used and reference is simplified by a decimal system of indexing.

The Code of Functional Requirements is being drafted by small groups of experts, nominated by the Committee and selected from a variety of sources. The General Series Codes are being drafted by Committees appointed by the professional institutions. It is interesting that the work being done by these committees—and there are a very large number of them—is on an unpaid basis, and the Code is in fact being written by the architectural and engineering professions in their spare time.

Flexibility An Objective

An essential feature of all Codes is that they should be sufficiently flexible to take account of new developments. This was one of the reasons for adopting such a clear-cut distinction between the "Functional" and the "General Series" Codes, for when a new technique is developed, if it can be shown by authorized testing methods to provide standards of performance required by the "Functional Code", it can be accepted as adequate, and if necessary a new code in the "General Series" can be written to cover it. In this way it can be added to the Code without disturbing the existing layout.

The question of codifying new methods of construction and new techniques is not a simple one, for it is often many years before new methods can be said to have received an adequate performance test. Accelerated testing methods and increased research facilities may help, but the problem still remains—how readily can new developments be accepted as adequate, and how soon is it necessary to codify them? On the whole, our view is that a new code in the General Series should be written only when the method has become sufficiently popular to require protection both for the industry and for the public against wrong use and bad workmanship.

The Functional Code has to cover recommendations which concern the layout and spacing of buildings—this applies particularly to questions of light and air, space, noise and fire protection. Some interesting problems arise here. One's first inclination is to rely on zoning, e.g., to recommend that the fire resistance required of building structures should depend upon the locality in which they are situated, a city area requiring more stringent standards than a suburban or rural area, and so on. On second thought, one realizes the fallacy of this—if the Code is to apply for a number of years, who can say which areas will remain rural or suburban in the future, or how much a city will grow? Would it not be better to work on the assumption that any kind of building can be erected anywhere, provided it is far enough back from its site boundary not to endanger neighboring buildings?

Adoption of Standards

Accordingly, we decided to work on the principle that every building should be set back a sufficient distance from its own site boundary to ensure that it should not be a nuisance or a danger to buildings on adjoining land, provided these buildings were erected according to the same rules.

Another problem which has arisen during the preparation of this Code is to formulate the standard to which we are working. The nearest we can get to a formulation is in the words—"A desirable standard of good practice". Unlike many legal codes, we are not laying down minimum standards, and in certain respects we recommend standards which are higher than the present emergency allows. We reckon the Code will be used for many years to come and we cannot, therefore, be influenced by periodic shortages of materials or emergency demands.

The scope of a Code such as this is a much discussed problem. There are some who would keep the Code within the limits of strictly scientific fact; there are others who see a Code such as this as a welcome opportunity to improve amenity standards and would include a number of immeasurable and intangible subjects. There are others who seek to express intangible subjects in scientific terms, convinced they are keeping to facts. I don't think one can exclude traditional practice or even matters of opinion from the scope of a Code, but I do feel it is most important to recognize which is which.

It would be useful, especially at the present time, when so many Codes are up for review, and so many new Codes are being drafted, if the experience of those who are taking part could be shared—in fact, if a "code of good practice in code drafting" could be written.

As a start, I have put down the following

rules, in the hope that others will come forward with more:

(1) The aim of a Code should be to open the way for new technical developments, and to make them available to the public.

(2) The difference between performance standards and specific techniques should be kept in mind at every stage of code drafting.

(3) Specific techniques may be codified, but should never be made obligatory; performance standards should be codified and should be obligatory, but machinery should exist for their review.

(4) Construction types should not be restricted by zoning rules; theoretically Codes should permit any building to be erected anywhere, provided it satisfied the Code's requirements.

(5) The difference between "scientific fact", "traditional experience" and "opinion" should be kept in mind when standards are being formulated. Wherever possible standards should be based on the first, but the second and third cannot be discounted.

The Question of "Advice" Versus Authority

By WALTER C. VOSS
Head of Dept. of Building Engineering and Construction, Massachusetts Institute of Technology, Cambridge, Mass.

MR. COLIN LUCAS' description of the approach to building code revision in England is refreshing. When one remembers that building codes are the end product of many years of custom, economic and political pressures, a certain degree of individual and group selfishness, and an expression of the growing pains of scientific development, it is not surprising that our building codes present in most instances a "patchwork" document. The English approach, because of a realization of this situation, which endeavors to start with a clean slate, seems to be the only approach which can and should bear fruit.

The separation of this study into the two parts proposed by Mr. Lucas, which involve performance standards and specific techniques, is likely to become confused unless the code authority is careful to consider some sort of an arbitrary dividing line between these two divisions. In many cases specific techniques are so closely linked to performance that it would be quite easy to duplicate or contradict intention, unless a specific division was clear. It would appear that a code of functional requirements, which is the performance standard element of this dual approach, would be in the nature of advice to the consumer or his agent and would assist the architect and engineer, as well as the builder, in incorporating the specific code techniques in such a way as to produce satisfactory results. This raises, in this country, a question of the authority of code writing bodies.

Nearly all of the building codes in the United States operate under fundamental statute law which provides police authority for the safety of the citizen. While it is true that many building codes have written into law many desirable fundamental requisites, it is very doubtful whether these requisites would stand the test of legal investigation. The only reason they still remain in our codes is perhaps public acceptance because of their rational nature. This whole question of police authority vs. "godfathering" our citizens so that they will not purchase or live or work in buildings which are not built according to the latest and best established practice confronts us with a consideration of the duties of government. In this country we like to believe that many of these items are a matter of individual choice, even though the choice is a poor one. The writer feels that codes should concern themselves with only that portion of construction which directly affects safety, in which would be included structural, fire and health hazards.

Waste of Materials

The writer would like to make another suggestion which Mr. Lucas may have in mind, but which he has not discussed in his article. This has to do with the terrific waste of materials which has been going on both in this country and in England from time immemorial. It would seem that materials which are used in the construction of buildings should be made to work as well as to present architectural shapes. The placing of solid masonry walls 100 or more stories in the air supported by heavy structural frames, and in which the masonry walls are not counted in as rendering structural support, is a good example.

I think that the English are to be commended for the fact that they have started a code revision which presents some logic. I hope that code authorities in this country will work closely with the English committee and perhaps a joint approach to the Code of Functional Requirements and even to General Series would be possible. There is great danger, as already suggested, in becoming too specific, and if I were to add a third division to this approach I would perhaps call it "Inspection and Enforcement." If this joint effort could be initiated we might bring about order out of the present chaos.

Appraisal of Rules Laid Down by Mr. Lucas

By GEORGE N. THOMPSON, Chief
Division of Codes and Specifications
National Bureau of Standards

MR. LUCAS describes a straightforward and courageous approach to a complicated problem. He already has enough to show in the way of published documents to make it clear that such an approach is feasible, even though it may not be fully comprehended by everyone nor possible of immediate accomplishment in all respects. The important thing is that the undertaking he describes is introducing logic and order into a hitherto unorganized mass of information. Moreover, it is being done under such responsible auspices that the results command respect.

Some apprehension may be expressed that the fixing of functional requirements may tend to prevent further progress in standards of building practice. One shudders to think for example, what functional requirements for light and ventilation might have been set down if the enterprise had been undertaken fifty years ago and had set the pattern for the ensuing period. However, the danger arising from acceptance of performance standards suitable at a given moment is one that must be accepted and provision made for periodical revision in the light of later developments. This is recognized in item (3) of the "rules."

With reference to these rules, item (1) is sound doctrine but it may be interpreted to place undue emphasis on new materials. Careful evaluation of the qualities of well-tried materials and improvements in their application are equally important. Item (2) is also to be commended. In order to make it fully effective, further work on development of standard methods of testing is needed in this country in order to relate the specific techniques more definitely to the performance standards. Item (4) requires a good deal of study before its full implications can be appreciated. Item (5) covers a problem familiar to all who have had any experience with code work. The substitution of fact for opinion is often a difficult process. Nor can it be carried through completely. Facts provided by tests, for instance, must still be interpreted in terms of practical use, and opinion enters at this point. The language in which this item is expressed summarizes very well the relative importance of the three elements mentioned.

Comparison of British and American Approaches

By MILES L. COLEAN
Housing Consultant
Washington, D. C.

THE idea of an extra-legal, advisory national building code, as described by Mr. Lucas is an excellent one. In its general theory, it resembles the approach adopted by our Department of Commerce during the Hoover Administration and, since 1933, that being slowly developed under the auspices of the American Standards Association. It represents the maximum that can be properly done by the national government under our system, and is one of the objectives sought by most advocates of building code reform.

The division of the code between recommended *performance standards* and *specific techniques*, the latter relating the performance standards to definite materials and methods of construction, also conforms to the principles generally advocated by American authorities.

The five rules stated by Mr. Lucas at the end of his article should, printed in bold face, be put at the front of every code-writer's notebook. They clearly and correctly provide the basis for the type of code that modern building requires.

From what examination I have been able to make of the English material, however, there appears to be much that would not

ordinarily be considered necessary or proper to embody in a local ordinance. It seems to be the aim to cover all aspects of the building process irrespective of its bearing on health and safety and thus to suggest an area of control beyond which we ordinarily seek to confine ourselves.

Thus the inclusion of recommendations concerning finishes, and particularly such matters as painting and floor coverings, would here be considered to have no place even in an advisory code and to be of no proper concern of the code authorities. From our point of view, these and other matters not clearly related to the public safety and welfare may properly be the subjects of commercial standards as set up under Department of Commerce auspices or under the procedure of the American Standards Association (as distinct from the code activities of the organization), but they should not become subjects of regulation.

Effect on Local Laws

Since it is not clear from Mr. Lucas' article the extent to which the national recommendations are intended to influence local by-laws, it may be that the features I have questioned simply fulfill the broad, non-regulatory function described above; but the term "code" has an ominous ring. Our need here is not to extend the area of regulation but to improve our methods within those areas now widely accepted.

It may be noted that much of the type of program outlined by Mr. Lucas is in this country being carried on by organizations such as the American Iron and Steel Institute, the Portland Cement Association, Southern Pine Association, American Society for Testing Materials, American Standards Association and many others. The English procedure, operating through joint government-industry sponsorship, provides a means for coordinating and expediting this work that is well worth considering here.

English and American Building Codes

By IRVING W. CLARK
Manager, Better Homes Department
Westinghouse Electric Corporation

THE English approach to the building code problem is quite different from any procedures developed in America. It is refreshing to see an entirely new formula which is worthy of careful consideration by those interested in code improvements for our own building economy.

While the English version lacks legal authority, its proper use and promotion can readily make it an effective instrument, not only to the construction industry, but to the owners and users of the completed projects. Actually it is a complete set of construction functional standards.

In America the entire building industry has long needed a similar set of construction standards based on sound functional practice. American codes have generally developed somewhat like "Topsy". Many persons confuse code regulations with zoning restrictions. Codes should establish standards of construction from a performance angle, while zoning regulations should designate the types of buildings that can be erected in a given location. Each is a separate set of regulations. Every effort should be made to guard against the intrusion of either of these restrictive functions upon the other.

All of our present codes are based on minimum standards of safety and do not necessarily constitute standards of sound functional practice. There is a wide margin between a standard of safety and a good sound functional standard of design, which is usually higher than the safety standard.

The electrical industry has recently taken steps to solve partially its part of the problem. A set of wiring standards has been developed for interior house design. These standards are based entirely upon sound functional principles and are considerably above the standards of safety established by the National Electric Code. Each branch of the construction industry should take similar steps. It is essential, however, that the program, to be successful, be developed on an industry-wide basis.

English Methods Praised

The separation of the English code into functional requirements and general series codes is the key to its probable success and maximum usefulness. The development as a separate part of their code revision, a set of "general series" of codes dealing with specific materials and methods permits the flexibility long needed in the American code as a means of authorizing new methods, new materials and new techniques.

All of our building codes are supported by the constitution under police power and the term "welfare" has to date been narrowly construed by the courts. We must therefore live with minimum practices as defined by local codes. This affords the speculative contractor the opportunity to produce structures that meet code requirements only, with a complete disregard for sound functional requirements.

It is hoped that the construction industry, working through a proposed Construction Research Board of the National Research Council, will give careful consideration to the application of the English code technique as a possible answer to America's present complicated building code problem.

Basic Building Code for the United States

By ALBERT H. BAUM
Building Commissioner, St. Louis, Mo.
and
General Chairman, Basic Building Code Committee, Building Officials Conference of America

NEVER before in history has the subject of "Building Codes" been given the universal attention it is now receiving. Probably this is due to the experience gained in the war with new and rapid methods of construction and the development of a mass of new materials applicable to peace time building uses.

Most of the publicity has been detrimental to Building Codes as comments usually center on the fact that all Codes are antiquated, regardless of the fact that many cities have recently revised their Codes on a functional basis by qualifying building materials on performance standards.

Difficulties of Code Revision

Revision of a Building Code is an expensive and tedious undertaking which deters City Officials from a general periodic review. It is interesting to note, however, that American Codes are not alone in their need for general modernization.

From a review of the British method of procedure by Mr. Lucas, I detect a marked similarity to the project now in progress in the preparation of a new Basic Building Code by the Building Officials Conference of America.

The new Code will be in two parts. Part I will cover basic and fundamental requirements and will outline the requirements all buildings and structures must meet for specific purposes and uses. This part of the Code will therefore be little subject to change, as basic requirements are axiomatic.

Part II will state ways and means in which the requirements of Part I may be met. This part may be subject to periodical changes or amendments as conditions demand. As it will be in loose leaf form, amended sections can be easily removed, and new sections or additions readily inserted, thus making it possible to maintain the Code constantly current.

Briefly, Part I will state *WHAT* must be done and Part II will state *HOW* it may be accomplished. The new Basic Code will then be entirely functional, flexible, easily amendable and always up-to-date.

The Basic Code is designed as a universal medium and will be made available for adoption by any City or Town. Building Officials, Owners of Property, Manufacturers and the Construction Industry will be greatly benefited when this new instrument is perfected, as construction methods and materials in our various localities will have a universal standard instead of the hodge-podge of individualistic codes now in existence.

Additional Features

Upon completion of the Basic Code (Part I and II) a third volume is contemplated for use by smaller communities not equipped with technical personnel competent to administer a comprehensive code designed for organized Building Inspection Units.

Part II will be known as the Construction Supplement for Smaller Communities, which will outline fundamental requirements, contain abridged details of meeting these requirements and contain tables of simple joist, beam and column loadings for various spans.

In my opinion much similarity exists between the British and American endeavors as the British Code of Functional Requirements is similar to our Basic Code, while the British "General Series of Codes" is similar to our Part II on Construction Requirements. Both groups seem to be working toward the same solution.

NAACP

NAACP LAWYER THREATENED
BY CHICAGO RACE-BAITERS December 13, 1946

New York, Dec 12th--Hurling ugly epithets and threats at her, a hysterical mob of race-baiting Chicagoans closed in on Mrs. Marian Wynn Perry, NAACP attorney, last Monday, when she accompanied Thurgood Marshall, NAACP Special Counsel, to the scene of an incipient riot in front of the recently completed Air Port Homes in Chicago's South Side. The mob had gathered to protest the arrival of Negro veterans and their families to take up occupancy in the apartments assigned them by the Chicago Housing Authority in the tax-supported project set up for Chicago veterans. Mrs. Perry's appeals to the police for protection were met with the request to "Keep moving," and no action was taken against the persons who were threatening and insulting her--in fact, the police treated her as an outsider and did not seem to feel any compunction to rebuke or arrest her antagonists.

The two NAACP lawyers had rushed to Chicago to investigate reports of rioting against Negroes, which gave evidence of building up into a riot of the serious proportions of the Detroit riot, in 1943, when Negroes attempted to move into the Sojourner Truth Houses there.

In appeals to federal and local authorities to implement the pledge of Mayor Kelly and the Chicago Housing Authority that there would be no racial discrimination in the Air Port Homes, NAACP national and local officials, civic, religious, veteran and labor groups sent telegrams and delegations to the Mayor and the Police Department to assure this pledge being carried out with the necessary police protection.

Mrs. Perry and Mr. Marshall are in close contact with housing authorities and with civic groups anxious to prevent a recurrence of violence against Negro tenants in this and future city housing projects, and are giving legal advice to the attorneys of the two veterans who braved possible harm to move into their apartments on Tuesday, December 10th, although five other veterans withdrew from the project.

The two veterans, John R. Fort, and Letholian Waddells, who are relying on police protection to maintain them in their homes at present, have spent two nights in their new homes. Both have wives who are pregnant, and they look forward to having them join them soon, when the danger of physical violence seems past. The night their furniture was moved in, a mob attacked the departing van, and five men were arrested--although their trials were not set until February. The night the veterans moved in, a mob of over 300 stood about a bonfire in front of the project shouting threats, but no arrests were made. No mob appeared the second night, probably because of a heavy rainstorm. The situation is one which still bears watching, but now its terrifying implications are clear to most Chicagoans, and the delegation is growing which has been daily visiting the Police Department to insist on adequate protection for the new occupants and on stern measures against the violent members of the mob.

Both Mayor Kelly and the Chicago Housing Authority have taken a firm stand on upholding the rights of Negroes to live in a city-owned project, and promise to embark on a program of education of the public

(Continued)

and the police to better their understanding of race relations problems.

Chicago, with only ten emergency housing units in a city of fifty wards, has an explosive situation on its hands, and its success or failure in solving it will set a pattern for other cities dealing with similar post-war housing problems.

SAN MATEO NAACP BRANCH
PROTESTS BURNING OF VET'S HOUSE Dec 13, 1946

San Mateo, Calif., Dec 9th--Outraged at the failure of local officials to investigate the burning down of a new house owned by a young Negro veteran, John T. Walker, on December 6th, the San Mateo branch of the NAACP raised the sum of $104 at its regular business meeting last night toward a reward for information leading to the apprehension and arrest of the arsonist. The branch also appointed a committee to see the City Council to present a letter protesting the indifference of its enforcement officers and the general attitude of officials, who dub the arson "a boy's prank", not to be taken too seriously.

Mr. Walker had been receiving threats and warnings from some white people in the neighborhood ever since August, when it was learned a Negro was building a new home there. Although the letters were taken to the postal authorities, Walker was told by the County Attorney and the Sheriff of the County that they could do nothing until some criminal act had taken place. The house was burned before its completion, and the State Attorney General has been contacted by N. W. Griffin, NAACP Regional Secretary, who states that branches in Palo Alto, as well as San Mateo, are most concerned about this occurrence.

Southern Regional Council

RESOLUTION BY THE MINNEAPOLIS
BUILDING AND CONSTRUCTION TRADES COUNCIL (AFL)

WHEREAS, the Minneapolis Central Labor Union at its last meeting held January 8, 1947, adopted a resolution, copy of which is hereto attached, and which has been referred to this body for action thereon, and

WHEREAS, it appears evident that the contents of the attached resolution is the declared policy of the American Federation of Labor and the Minnesota State Federation of Labor,

NOW THEREFORE, BE IT RESOLVED by the Minneapolis Building and Construction Trades Council (AFL) that :

We adopt and put into effect the recommendations therein made by the Minneapolis Central Labor Union in the same manner and with the same force and effect as though originally adopted by this body.

DATED AT MINNEAPOLIS
this_____
day of January,
1947

Minneapolis Building and
Construction Trades Council
(AFL)

By_____
Its President

By_____
Its Secretary

RESOLUTION OF THE MINNEAPOLIS

CENTRAL LABOR UNION

WHEREAS, the American Federation of Labor at its 1946 convention in the city of Chicago, State of Illinois, took action against groups or individuals engaged in un-American activities consisting of, among other things, discrimination against various groups of citizens because of their race, religion or national origin, and

WHEREAS, by the terms of the resolution the American Federation of Labor called upon all unions affiliated with the American Federation of Labor:

> "to wage an unrelenting struggle against the groups responsible for the spreading of the poison of anti-Catholicism, anti-Protestantism, anti-Semitism, anti-Negroism, and other forms of racial prejudice",

and

WHEREAS, the resolution further urged that support be accorded by the American Federation of Labor Executive Council to affiliated organizations in the undertaking and carrying out of an educational program calculated to promote tolerance, understanding, and amity among the various groups comprising the family of the American organized Labor movement, and

WHEREAS, in furtherance and support of the foregoing resolution the Minnesota State Federation of Labor (A. F. of L.) at its 64th convention held at Mankato, Minnesota, on September 18th, 1946, adopted a resolution resolving: "that each affiliated local union establish a Committee on Human Relations, the duties of which shall include:

RESOLUTION OF THE MINNEAPOLIS

CENTRAL LABOR UNION

1. The presentation of factual material to the membership on racial and religious tensions;
2. Informing the membership of the anti-labor tactics used by hate-mongers who spread anti-Catholic, anti-Protestant, anti-Jewish, or anti-racial poison; and
3. To cooperate with community efforts to create mutual respect among all sections, classes and groups in human relations," and

WHEREAS, the Minneapolis Board of Union Business Agents (A.F. of L.) at its regular meeting of December 18, 1946, took cognizance of the foregoing action taken by the American Federation of Labor and the Minnesota State Federation of Labor and recognizing the grave danger to the Labor movement, because the groups engaged in the subversive activities hereinbefore referred to are the same groups which also preach and practice the doctrines of hate against organized labor; and

WHEREAS, it came to the attention of the Business Agents at this meeting that three Minneapolis veterans of World War II were denied by certain Minneapolis real estate firms the right to purchase and construct homes under the GI Bill of Rights because of their religious beliefs, and

WHEREAS, the Minneapolis Board of Union Business Agents has invited our attention to the fact that certain practices and restrictive covenants exist in the city of Minneapolis and areas immediately adjacent thereto which bar certain persons from purchasing or owning homes because of their race, religion, or national origin, and

RESOLUTION OF THE MINNEAPOLIS

CENTRAL LABOR UNION

WHEREAS, the Minneapolis Board of Union Business Agents recommended that the Minneapolis Central Labor Union and the Minneapolis Building and Construction Trades Council take positive action against these nefarious practices and covenants by refraining from performing labor and services on the construction of dwellings upon any property where such practices or restrictive covenants exist, and

WHEREAS, the Minneapolis Central Labor Union recognizes the dangers to the Labor movement as set forth in the foregoing resolutions by the American Federation of Labor, the Minnesota State Federation of Labor, and the Minneapolis Board of Union Business Agents, and are in full accord with the action therein taken and recommendations therein made;

NOW THEREFORE, BE IT RESOLVED by the Minneapolis Central Labor Union that:

1. Wherever, within the area of our jurisdiction, such restrictive or discriminatory practices or covenants are called to our attention, a permanent joint standing committee representing the Minneapolis Central Labor Union and the Minneapolis Building and Construction Trades Council shall be appointed to forthwith investigate the merits of the complaint by consulting with all interested persons or firms alleged to be the perpetrators of such practices and to induce them to cease and desist from the continuance of such practices, and

RESOLUTION OF THE MINNEAPOLIS

CENTRAL LABOR UNION

2. If through our joint action we are unable to correct such abuses after reasonable efforts, then we recommend that the Minneapolis Building and Construction Trades Council take action to refrain from performing labor and services on such dwelling construction, and

3. That the within resolution be referred to the Minneapolis Building and Construction Trades Council to join with the Minneapolis Central Labor Union to take such action in the premises as will effectuate the purposes of this resolution.

Housing

STATEMENT OF THE ATLANTA URBAN LEAGUE

prepared by

R. A. Thompson, Jr.

Presented to the Joint Congressional Committee on Housing

Hearing in Atlanta - October 29, 1947

The Atlanta Urban League is a social service agency working primarily in the field of community organization. It is one of 59 affiliates of the National Urban League. It cooperates with the Atlanta Community Planning Council and other agencies and organizations in developing methods for dealing with social problems affecting group relations in this community.

We are aware of the critical housing needs of Negroes in Atlanta. A Housing Committee representing all groups affected by the need has been at work on the problem for many months. This committee has stated that:

> During the war years and the ten depression years preceding it, far fewer houses were built in Atlanta and the rest of the nation than were needed for our expanding population. The war emergency and the present post war period have brought increasing pressure for expansion of white housing facilities, but little attention has yet been given to adequate housing for the colored population. ...The Negro population has overflowed the maximum possible use of present facilities with the result that colored families have been forced to move into housing areas in white fringe sections. Increasing friction between races has been met by only small scale attempts to rectify the situation. The present overcrowding of central areas has resulted in a blight that tends to lower values of adjacent properties and is a direct menace to health, safety, morals, and the prosperity of the entire community.

Housing is the number one problem in Atlanta. In addition to the problems facing all citizens in need of decent housing, Negroes meet distinct difficulties which arise from restrictions to low income jobs, limited land for expansion and too few houses available for rent or purchase. In order, therefore, to appraise and understand the nature and intensity of the

problem of Negro housing, it is advisable to look more closely at the living conditions of the Negro population.

POPULATION

In 1940, there were 129,543 Negroes living in Metropolitan Atlanta, and this number represented 29.3 per cent of the total population. For the same year, 104,533 or 80.7 per cent of the total population lived in the city limits of Atlanta. In 1947, the Negro population had increased to 142,855 which represented an increase of 13,312 or 11.0 per cent. The proportion of Negroes living within the city limits in 1947 is approximately the same as that of 1940.

Where They Live

Approximately eight square miles (7.98) or 25 census tracts housed 93,344 Negro residents of Atlanta in 1940. These twenty-five tracts contained 89.3 per cent of all Negroes living inside the city limits of Atlanta. In other words there were 11,709.8 persons for each square mile and each square mile held 3,222 Negro families.

How They Live

According to the Real Property Report of 1939, Negroes occupied 34,522 dwelling units, and of this number only 13,7 per cent or 4,717 were classified as owners and 29,805 or 86.3 per cent as renters.

Of the total number of Negro dwelling units, 24,712 or 71.6 per cent were listed as sub-standard units. The three main causes for this classification in order of importance were:

1. Physically substandard
2. Physically and occupancy substandard
3. Adequacy substandard

There has been relatively little change in the condition of houses for

Negroes in Atlanta since 1940. In 1947, the Department of Commerce reported 40,426 dwelling units for Negroes. Of that number 23,124 or 57.0 per cent were without private bathing facilities. Sixteen thousand or 43.0 per cent of the total number lacked flush toilets in the dwelling unit. Over eleven thousand or 28.0 per cent of the total number are in need of major repairs.

The Negro dwelling unit is overcrowded. Only 5,986 or 15.0 per cent of the total 40,426 dwelling units have less than 0.5 or less persons per room. 26,117 or 65.0 per cent have from 0.51 to 1.50 persons per room and, 8,323 or 21.0 per cent have 1.51 or more persons per room.

For such dwelling units Negroes paid $9.00 and $14.00 monthly rent in 1939 and 1947 respectively.

LAND

Another basic factor is that of acquiring land sites which meet F.H.A. requirements.

The acquisition of land beyond the city limits of Atlanta is imperative not only because of the present congested housing condition in 1947 but also for the reason that more and more Negroes will continue to migrate to urban areas. As previously mentioned 25 census tracts have the majority of the Negro population. The density of these areas in 1940 was as follows:

6 census tracts had 20,500 persons per square mile
5 had 15,500 to 20,499 persons per square mile
4 had 10,500 to 15,499 persons per square mile
9 had 5,500 to 10,499 persons per square mile and
1 had less than 5,500 persons per square mile.

The Negro population, which is a third of the total population, lives on slightly more than one-fifth of the land. In other words, the 7.98 square miles, the total acreage of the 25 census tracts, represents 23.2 per cent of all acres in the city limits of Atlanta.

SLUM CLEARANCE PROPOSAL

Atlanta's Slum Clearance Plan has been passed and signed by the Mayor and City Councilmen. The main points of the plan are as follows:

1. That there be established a slum clearance committee which for 5 years and beginning in 1948 would eliminate all substandard housing in the City of Atlanta;

2. That City officials be given authority to require repairs to be made on the 34,000 dwelling units; and

3. That private businesses submit by March 18, 1948 a plan for rebuilding and refinancing the 6,000 slum units which are beyond repair.

Such a slum clearance program may mean that 24,712 or 71.6 per cent of the total number of Negro dwelling units may be affected by the ordinance. If so, the big question is how or what provisions can be made to rehouse these Negro families.

A slum clearance program has been underway in the Buckhead section of Fulton County for over six months. Many of the houses of 100 or more Negro families have been purchased by Fulton County Parks Commission and will be torn down in order to provide park facilities for the white residents of Buckhead. Thus far, no provisions have been made to rehouse these people or provide land where they may live near their work. Many of the dispossessed Negro families have moved into the overcrowded housing condition in the City of Atlanta.

VETERANS

The Department of Commerce in its report for December 12, 1946 estimated that there were 6,000 married and 3,500 single Negro veterans who represented 23.7 per cent of the total number of veterans in Metropolitan Atlanta. The report also showed that approximately 10 per cent or 950 Negro veterans lived outside of metropolitan Atlanta prior to induction. Approximately 6,000 or 20.0 per cent of the total 30,500 white veterans lived outside of the city of Atlanta prior to induction.

The majority of the Negro veterans were employed. Of the total 9,500 Negro veterans, 7,390 or 77.8 per cent were employed in a gainful occupation and earned between $27.00 for single and $31.00 weekly for married veterans. The median weekly income for white single veterans was $32.00 and $52.00 for white married veterans.

Where They Live

Rented rooms, trailers and tourist cabins accounted for 8,000 or 20.0 per cent of all the veterans in Atlanta, while 32,000 or 80.0 per cent lived in ordinary dwelling units. The Negro veteran lived mostly in ordinary dwelling units but nearly half of the six thousand married veterans shared the dwelling unit with relatives.

How They Live

Of the 32,000 veterans who lived in ordinary dwelling units, 66.0 per cent or 21,112 were considered as being in good condition or needing minor repairs. Over 10,000 or 14 per cent required major repairs or were declared unfit for use. Over seventy per cent of the total 30,500 married and single white veterans lived in houses which were in good condition or in need of minor repairs, and only 5.0 per cent occupied substandard dwelling units.

The proportion of Negro veterans living in ordinary dwelling units was higher than for white veterans, but over half of the Negro veterans' dwelling units needed major repairs or were considered as unfit for use. It should also be pointed out that 80.0 per cent of the 9,500 Negro veterans who live in ordinary dwellings pay rent. Over 60.0 per cent of the white veterans rent, and 21.0 per cent owned their homes.

How Much They Pay

The average monthly gross rent paid by veterans was $33.00. One fourth of the 40,000 units rented for less than $21.00, and one-fourth rented for more than $47.00 per month. The average monthly rent for white married veterans ranged from $29.00 to $51.00 in 1946.

The average monthly rent paid by married Negro veterans was $18.00 in 1946. The minimum monthly rent was $13.00 and the maximum $23.00.

Their Housing Plans

A majority of the veterans plan to remain in metropolitan Atlanta, and desire to buy or build a 5 room house costing about $5,500. The average price the white veterans can pay for a 5 room house is $6,200 financed by payments of $46.00.

The Negro veteran desires a 5 room house costing about $3,800 with monthly payments of $31.00. Only one-fourth of the 9,500 stated that they were able to pay more than $4,800 for homes with five rooms. However, 2,375 Negro veterans wanted their houses to cost less than $3,000.

Notwithstanding the desires of veterans to purchase homes, over 3,000 Negro veterans are on the waiting list of the Atlanta Housing Authority. These 3,000 Negro veterans, as of July 1947, sought an apartment in the five housing projects which can accommodate only 2,965 families. Over and above the number of Negro veteran applicants approximately 2,500 applications have been declared ineligible for admission into these projects.

Proposed Number of Dwelling Units for Atlanta

Many contractors and builders had plans for erecting 11,065 dwelling units in Atlanta as of June 1947. The number of units in each sub-division ranged from 13 to 2,500, and the majority of such units have been scheduled for areas outside of the city limits of Atlanta. Over six thousand units will be located in DeKalb County and 5,000 in Fulton County.

Of the total number of proposed dwelling units 10,955 or 90.0 percent will be homes for white residents, and only 1,110 or 10.0 percent for Negro families. Of those being erected for Negroes, approximately 150 owner units are about ready for occupancy. On the basis of information given

by the Department of Commerce, it is evident that these $5,800 to $8,000 homes exceed the ability to pay of the average Negro veteran.

CONCLUSION

In as much as most of the slums are now inhabited by Negroes who have been traditionally restricted to given areas, the first objective in any national approach to the housing problem is to locate land and erect more dwelling units into which present occupants of sub-standard units may move. This approach should be made by organizations and persons of both racial groups directly concerned with the development of dwelling units or the erection of businesses in Negro neighborhoods.

In view of the condition of homes and the fact that the Negro population continues to increase, it is apparent that this minority group needs additional housing units. The Mayor's Emergency Housing Committee estimated that 4,500 dwelling units are needed to house approximately 10,000 veterans.

The Atlanta Urban League's housing committee estimates that 10,000 standard dwelling units are needed for Negroes in metropolitan Atlanta.

RECOMMENDATIONS

In order to alleviate the critical housing shortage and to eradicate the slums which are a menance to the health and morals of Atlanta, the following recommendations are made:

1. That condemnation proceedings be instituted by city and county officials against unfit housing units, tax delinquent property, and unoccupied land which may be used for Negro expansion and housing.

2. That Federal Funds be made available to cities, which have

established Urban Redevelopment Programs, in order that private enterprises may build and rebuild homes in keeping with the ability to pay of Negroes;

3. That Congress enact legislation which would permit local housing authorities to expand present public housing facilities;

4. That the Federal Government establish a Housing Bureau to devise new techniques and methods for cutting the cost of building materials.

5. That the G.I. Bill of Rights be amended so as to permit more than 2 veterans to purchase and own dwelling units cooperatively;

6. That the present staff of F. H. A. lend increased assistance to local groups with housing interests, and that this agency encourage the mobilization of local community resources for better housing for all groups in the population.

THE HOUSING PROBLEM

It should be remembered that slum clearance—widely publicized in recent months—is but one aspect of the overall housing picture. It is, however, a most important one. More and more we have come to realize that the problem of decent low-cost housing is not that of the slum-dweller alone, but of the community as a whole.

Slums constitute a financial and social hazard which no city can afford. These areas, which provide so little of Atlanta's tax revenue, are the most costly to the city in their use of medical services, police and fire protection and social services. Furthermore, the epidemics and crime waves which have their sources in these blighted districts do not usually respect persons or income in their spread.

The current issue of FACTS is devoted to housing in the belief that it is of primary importance to every Atlanta citizen. Three recent studies of the problem are summarized in the following pages. We urge that you give them careful thought. You may be asked to vote at the annual meeting on a probable Housing item for the League's 1948 active program. Such an item was placed last year on the League study program. Thorough analysis of all available housing material is being made by a committee in connection with this program. This issue of FACTS gives the highlights of their study necessary to a further consideration of the problem at the annual meeting.

ENFORCING THE LAW

Passing an ordinance is often easy, but enforcing it is another thing. Many a law has died on the statute-books simply because public opinion has not been strong enough to demand enforcement of its provisions.

Is public opinion strong enough at the present time to keep the housing issue alive until actual progress can be made?

Will the problem be met before there is another lapse into general lethargy?

Elsewhere in FACTS is given a summary of Atlanta's slum clearance ordinance. Numerous civic organizations, individual citizens and public officials have solidly supported the measure. Additional personnel to carry out its provisions has been requested of city council.

In actual practice the ordinance will be difficult to enforce in its entirety until the acute housing shortage is alleviated. Immediate progress can be made in bringing existing dwellings up to better standards. But when buildings are condemned as being beyond repair and occupants are forced to seek other living quarters, it will naturally be very difficult for them to find other quarters until new housing is available.

The Home Builders Association has proposed a plan to build homes, thinking in terms of hundreds, to rent for $25 monthly and to cost not more than $3,000. According to the plan, "the houses will be used for families displaced as the city carries out the first phase of the anti-slum campaign—repair of correctable substandard housing. Inspectors have found that even in this phase of the drive it will be necessary to raze scattered houses. It will also be necessary to end overcrowding in others."

This plan or some other must be carried out if slum clearance is to be finally achieved according to the high standards set up in Atlanta's slum clearance program.

CENSUS BUREAU STUDY

Atlanta's housing problem was thoroughly analyzed by the U. S. Census Bureau in a report published in August, 1947.* A summary of this report was made by Joseph B. Hosmer, industrial economist at the Georgia Tech experiment station, who concluded that "the economic growth of the Atlanta metropolitan area is being slowly strangled by a lack of housing more serious than exists in any other metropolitan area, with the possible exception of Memphis."

Here are some pertinent facts brought out in Mr. Hosmer's study:

The Atlanta area has lost seven thousand families, or about 25,787 persons, who did not come to Atlanta because of lack of housing and who answered the demand for their services elsewhere. Present population is 498,109. It would have reached 523,896, fairly close to the level anticipated by most recent estimates of expected growth.

There is more doubling up in metropolitan Atlanta than in any other area except Memphis. 19,000 married couples are sharing dwelling units with others.

The blame for the excessive and continued housing shortage in Atlanta cannot be placed completely on any one group.

The remedies are neither obvious nor easy. Costs for new construction remain out of line, both with the general picture and with the index of building costs. Building codes reflect outmoded methods of construction and probably make some otherwise acceptable methods of cutting costs difficult to apply. Financing of sales has improved over the past quarter century but appears to be currently more difficult for small contractors. Then small contractors appear to be "carpenter-minded" and as a result have limited knowledge of masonry construction which currently has an easier material situation and surprisingly sometimes costs less. Part of the answer may be found in the consolidation of groups of small contractors, part in the simplification of sales methods and part in open-minded planning by material dealers, contractors and real estate operators with a willingness to recognize that some of the basic patterns have been altered.

OTHER FACTORS

The Census Bureau study shows a further condition than that of doubling up and actual shortage of housing. Of all dwelling units occupied in 1947, Atlanta rates third among the 34 selected cities in percentage of dwelling units in need of major repairs or without private bath. Atlanta rates second as having the lowest percentage of dwelling units with all designated facilities: electric lighting and running water; flush toilets and bathtub or shower; installed cooking facilities for the exclusive use of the unit's occupants.

Furthermore, this same study shows that for all tenant-occupied dwelling units, Atlanta rates second to Birmingham and equal to Memphis in the lowest median monthly rent. Atlanta's median monthly rent for these units is $20. This is for 1947. In 1940 it was $15.

CHAMBER OF COMMERCE REPORT

The following report was made by the Housing Committee of the Atlanta Chamber of Commerce in the belief that "a factual study with a properly long-range viewpoint is necessary to determine just what is needed in new housing here." A summary of the committee's findings follows:

Atlanta's metropolitan population of 550,000 is made up of about 149,000 families. With an estimated 128,000 dwelling units available for occupancy, there is immediate need for 21,000 additional white and negro units.

Below is a tabular breakdown of Atlanta's housing needs according to income-groups by families. Income figures are January, 1947, estimates.

Family income	under $1600	$1,600 to $2,200	$2,200 to $2,700	$2,700 to $3,200	$3,200 to $4,200	$4,200 to $6,600	over $6,600
Per cent of families	26.4	14.9	7.1	7.3	14.6	18.6	1.11
Number of families (Total 21,000)	5,544	3,129	1,491	1,533	3,066	3,906	2,331
Potential rent or monthly purchase payment*	$26.66 (maximum)	$26.66 to $36.66	$36.66 to $45.00	$45.00 to $54.00	$54.00 to $70.00	$70.00 to $110.00	over $110.00
Dwelling unit value**	$3,808 (maximum)	$3,808 to $5,237	$5,237 to $6,428	$6,428 to $7,714	$7,714 to $10,000	$10,000 to $15,714	over $15,714

* Based on generally accepted figure of 20% of income.

** Based on estimate that each $7 of rent or purchase payment represents $1,000 of total unit value.

In 1946, 6,722 dwelling units were constructed in this area, with about the same number of new families settling here. The Southern Bell Telephone Company, long a recognized statistical authority, predicts that Atlanta will average a net gain of 6,000 families a year until 1950. All three major utilities serving Atlanta base their expansion plans on similar figures. So if construction can be maintained even at 1946 levels, the 1950 housing shortage will be little less acute than now. If construction could be boosted to 10,000 units annually for the next three years, 1950 would still see a shortage of 10,000 units.

As indicated by the above figures, the greatest need for housing is in the low-income brackets. Due to high costs, it is obvious that these needs cannot immediately be relieved. The long-range solution, and indeed the only alternative, is to build as rapidly as possible those houses that can be constructed practically. Further, it is assumed that relief will thus be felt in the lower brackets as well, since certain numbers of families will move out of older houses into new ones, creating vacancies in lower sales price and rental ranges.

HOUSING AUTHORITY REPORT

The 1945-47 report of the Atlanta Housing Authority* corroborates the Census Bureau Study but is based only on the corporate limits of Atlanta, rather than the entire metropolitan area.

"Atlanta's housing problem," according to this report, "has been taking form for years. . . . Simple statistics reveal the serious situation. According to the 1940 U. S. census report, there were 84,746 dwelling units. Of these 38,653 were substandard. That means, among other things—that 10,000 dwelling units were without running water; that 22,000 home units were without sanitary, inside flush toilets; that 28,000 dwelling units were without baths.

"Considered from the standpoint of occupants, more than 30% of the white families of Atlanta lived in substandard housing units—more than 70% of the non-white residents lived in sub-standard quarters—and 1,100 sub-standard dwellings were vacant. But that was back in days when there were vacancies.

"History has shown that the population of Atlanta, within the city limits, increases at the rate of about 20% in each ten-year period. The population of corporate Atlanta at the time of the 1940 census was 302,288. These people occupied 80,000 dwelling units. Even then, the housing situation was 'tight' because the vacancy rate was below normal.

"The war years have intervened since 1940. Population has grown—the higher war-time marriage rate has increased the number of family units beyond the normal rate—and new housing construction has been virtually at a standstill, especially when the drastic need is taken into account."

*Available in full at League office.

ATLANTA'S SLUM CLEARANCE PLAN

Three measures to facilitate slum clearance have been passed and signed by the Mayor and Council to date. They are:

1. A resolution setting up the slum clearance committee and announcing Atlanta's intention of wiping out substandard housing in five years, beginning January 1, 1948. (Request has been made for a Citizens' Better Housing Forum to serve in an advisory capacity to the slum clearance committee.)

2. An ordinance giving the city additional authority to require repairs to 34,000 houses which can again be made decent places in which to live.

3. A resolution urging private enterprise to submit by March 18, 1948, a plan for rebuilding or refinancing 6,000 slum units which are beyond repair.

TERMS OF ORDINANCE

Under terms of the ordinance referred to above, the city building inspector is empowered to require repairs to all houses of the following types:

1. Those damaged by fire, wind and other causes, and thus dangerous to the "life, safety, morals or the general health and welfare of the occupants."
2. Dilapidated, decayed, unsafe and unsanitary buildings likely to cause disease.
3. Those with inadequate light, air and sanitation facilities.
4. Homes with inadequate fire exits.

(Continued on page 6)

5. Buildings with parts "so attached that they may fall and injure members of the public or property."

The Building Inspector gives the owner notice of the corrections required, and allows a reasonable length of time for compliance. If the owner ignores the order, the case can be taken into the Recorder's court, and the owner compelled to comply or pay $500 fine or serve 60 days in a work camp for each ten days the prohibited conditions are maintained.

In case the nuisance is not abatable, the owner is required to demolish the building. Disobedience of this order may be followed by the city's demolition of the property at the owner's expense.

REDEVELOPMENT PLAN

The Redevelopment Plan, as practiced in Indianapolis, has received marked interest from those who follow the problems of low-cost housing. Under this plan, the local government and private industry cooperate to provide such housing.

The local government, through the Redevelopment Commission, has the power to declare areas to be substandard, and to acquire these areas. The government then clears the property, and, with the aid of architects, surveyors, etc., makes detailed plans for its reconstruction. The cost of these services is borne by the city through a tax levy not to exceed 5 cents per $100. The cleared property is offered for sale or lease to the highest bidder who will agree to follow the plans laid down by the Redevelopment Commission.

If this plan were adopted in Atlanta there would be no need to establish a new agency, since the Atlanta Housing Authority now has the legal right to carry out all the duties as a Redevelopment Board as defined in the Indianapolis bill.

WHAT CITIES AND COUNTIES CAN DO

It is agreed among housing authorities that there are at least three specific things which cities and counties can do in regard to the housing problem:

1. Rigorous enforcement of health, fire and building ordinances in slum areas.

2. Establishment of strict zoning laws and long-range planning.

3. Rationalization of the tax structure, shifting some of the tax burden from real estate to other sources of income.

The fact that local governments depend for the main source of their revenue from ad valorem taxes is worth consideration, in particular for the benefit of individual home owners who have no way of passing on this tax.

Atlanta has studied the possibility of a city income tax; the state legislature has appointed a committee to study the tax structure of Georgia, including the ad valorem tax. The League urges you to watch developments along these lines.

TAFT-ELLENDER-WAGNER BILL

The Taft-Ellender-Wagner Bill (S. 866) was the national housing policy bill of the 79th Congress which was reported favorably by the Senate Banking and Currency Committee. It was supported by the National League of Women Voters. It will probably be revived in the next Congress. There is considerable support for the measure in the Senate, although the outcome there is by no means assured. Opposition is strong in the House of Representatives.

The bill offers an over-all program for housing through the following provisions:

1. Slum Clearance and Urban Redevelopment.

Slums have continued to exist primarily because they are profitable investments for their owners, who have collected a substantial return as a result of overcrowding and low maintenance expense. It is only through government assumption of the difference in cost between their present uses and socially desirable ones, that slum areas can be developed. This bill makes federal assistance available for this purpose up to two-thirds of the write-down cost, the local community to provide the other third. In this bill, for the first time, the same aid would be given to private developers as has heretofore been available to public housing projects.

2. Housing for Low Income Groups.

This bill would provide the funds to construct 500,000 units in the next four years. In order that public housing will not compete with that which is built by private enterprise, the requirement is made that there must be a 20% gap between the lowest rents which private builders are able to provide and the top rents to be charged by a housing project. Safeguards are also included to insure that such undertakings will remain under local control.

3. Housing for Middle Income Groups.

The greatest shortage in the housing field is for those whose incomes are not low enough to need public housing but who find an insufficient supply of houses available to rent or buy at a price they can afford. (The FHA program of insured loans was designed to stimulate private building for this group by making financing available on favorable terms.) Special terms of a long mortgage (30 years), and a low rate of interest (4%) plus a down payment of only 5% are made available to owners of housing costing around $5,000 or $6,000.

4. Rural Housing.

This bill makes it possible for the department of Agriculture to provide assistance in making farm homes livable and adequate. The problem is quite different from urban housing, since a farm is an economic unit as well as a residence. Special safeguards are set up so that permanent housing will not encourage the operation of uneconomic farms in perpetuity.

5. Research.

One reason that housing has lagged behind in technological development has been the lack of adequate research on the methods of producing less expensive housing. This bill provides for considerable research.

Notice

League Elections

League elections will be held Wednesday, December 10, 1946.

Closing date for nominations will be Monday, November 10.

The Nominations Committee will submit a list of recommendations at that time. However, the by-laws provide that "Any member of the League may with her consent be nominated for membership on the board by written petition signed by at least ten other members and filed before the closing date."

Persons who accept board nomination should bear in mind the following:

1. Absence from two consecutive board meetings without satisfactory reason results in an automatic drop from the board.
2. All board members must serve on an active committee.
3. Board members must not be connected with any person or political group which would tend to jeopardize the non-partisan position of the League.

What is the life of the American Negro in the winter of 1948?

In the attached article, published in the February Commentary, James Baldwin gives an unforgettable picture of the Harlem Negro community -- "pervaded by a sense of congestion, rather like the insistent, maddening claustrophobic pounding in the skull that comes from trying to breathe in a very small room with the windows shut."

We think you will be interested in reading Mr. Baldwin's article, not only for the significance of the questions it raises, but because it introduces a young writer of exceptional talents. We should be pleased to receive any comments you may have to make, for possible publication in our "Letters from Readers" department.

Housing

FROM THE AMERICAN SCENE

THE HARLEM GHETTO: WINTER 1948

The Vicious Circle of Frustration and Prejudice

JAMES BALDWIN

HARLEM, physically at least, has changed very little in my parents' lifetime or in mine. Now as then the buildings are old and in desperate need of repair, the streets are crowded and dirty, there are too many human beings per square block. Rents are 10 to 58 per cent higher than anywhere else in the city; food, expensive everywhere, is more expensive here and of an inferior quality; and now that the war is over and money is dwindling, clothes are carefully shopped for and seldom bought. Negroes, traditionally the last to be hired and the first to be fired, are finding jobs harder to get, and, while prices are rising implacably, wages are going down. All over Harlem now there is felt the same bitter expectancy with which, in my childhood, we awaited winter: it is coming and it will be hard, there is nothing anyone can do about it.

All of Harlem is pervaded by a sense of congestion, rather like the insistent, maddening, claustrophobic pounding in the skull that comes from trying to breathe in a very small room with all the windows shut. Yet the white man walking through Harlem is not at all likely to find it sinister and no more wretched than any other slum.

Harlem wears to the casual observer a casual face; no one remarks that—considering the history of black men and women and the legends that have sprung up about them, to say nothing of the ever-present policemen, wary on the street corners—the face is, indeed, somewhat excessively casual and may not be as open or as careless as it seems. If an outbreak of more than usual violence occurs, as in 1935 or in 1943, it is met with sorrow and surprise and rage; the social hostility of the rest of the city feeds on this as proof that they were right all along, and the hostility increases; speeches are made, committees are set up, investigations ensue. Steps are taken to right the wrong, without, however, expanding or demolishing the ghetto. The idea is to make it less of a social liability, a process about as helpful as make-up on a leper. Thus, we have the Boys' Club on West 134th Street, the playground at West 131st and Fifth Avenue; and, since Negroes will not be allowed to live in Stuyvesant Town, Metropolitan Life is thoughtfully erecting a housing project in the center of Harlem called Riverton; however, it is not likely that any but the professional class of Negroes—and not all of them—will be able to pay the rent.

MOST of these projects have been stimulated by perpetually embattled Negro leaders and by the Negro press. Concerning Negro leaders, the best that one can say is that they are in an impossible position and that the handful motivated by genuine concern maintain this position with heartbreaking dignity. It is unlikely that anyone ac-

---

WHENEVER one ponders the progress of the American ideals of freedom and equality in the framework of today's realities, one inevitably thinks of the South—and of Harlem. How is it in Harlem in the winter of 1948? JAMES BALDWIN'S description of the Harlem ghetto also touches upon the delicate and perplexing problem of Negro-Jewish relations in this country, an unhappy complex which requires our best in understanding and courage. Mr. Baldwin was born in New York City in 1924.

quainted with Harlem seriously assumes that the presence of one playground more or less has any profound effect upon the psychology of the citizens there. And yet it is better to have the playground; it is better than nothing; and it will, at least, make life somewhat easier for parents who will then know that their children are not in as much danger of being run down in the streets. Similarly, even though the American cult of literacy has chiefly operated to provide only a market for the *Readers' Digest* and the *Daily News,* literacy is still better than illiteracy; so Negro leaders must demand more and better schools for Negroes, though any Negro who takes this schooling at face value will find himself virtually incapacitated for life in this democracy. Possibly the most salutary effect of all this activity is that it assures the Negro that he is not altogether forgotten, people *are* working in his behalf, however hopeless or misguided they may be; and as long as the water is troubled it cannot become stagnant.

The terrible thing about being a Negro leader lies in the term itself. I do not merely mean the somewhat condescending differentiation the term implies, but the nicely refined torture a man can experience from having been created and defeated by the same circumstances. That is, Negro leaders have been created by the American scene, which thereafter works against them at every point; and the best that they can hope for is ultimately to work themselves out of their jobs, to nag contemporary American leaders and the members of their own group until a bad situation becomes so complicated and so bad that it cannot be endured any longer. It is like needling a blister until it bursts. On the other hand, one cannot help observing that some Negro leaders and politicians are far more concerned with their careers than with the welfare of Negroes, and their dramatic and publicized battles are battles with the wind. Again, this phenomenon cannot be changed without a change in the American scene. In a land where, it is said, any citizen can grow up and become president, Negroes can be pardoned for desiring to enter Congress.

THE Negro press, which supports any man, provided he is sufficiently dark and well-known—with the exception of certain Negro novelists accused of drawing portraits unflattering to the race—has for years received vastly confusing criticism based on the fact that it is helplessly and always exactly what it calls itself, that is, a press devoted entirely to happenings in or about the Negro world. This preoccupation can probably be forgiven in view of the great indifference and frequent hostility of the American white press. The Negro press has been accused of not helping matters much —as, indeed, it has not, nor do I see how it could have. And it has been accused of being sensational, which it is, but this is a criticism difficult to take seriously in a country so devoted to the sensational as ours.

The best-selling Negro newspaper, I believe, is the *Amsterdam Star-News,* which is also the worst, being gleefully devoted to murders, rapes, raids on love-nests, interracial wars, any item, however meaningless, concerning prominent Negroes, and whatever racial gains can be reported for the week—all in just about that order. Apparently, this policy works well; it sells papers—which is, after all, the aim; in my childhood we never missed an edition. The day the paper came out we coul hear, far down the street, the news vendor screaming the latest scandal and people rushing to read about it.

The *Amsterdam* has been rivalled, in recent years, by the *People's Voice,* a journal, modeled on *PM* and referred to as *PV*. *PV* is not so wildly sensational a paper as the *Amsterdam,* though its coverage is much the same (the news coverage of the Negro press is naturally pretty limited). *PV*'s politics are less murky, to the left of center (the *Amsterdam* is Republican, a political affiliation that has led it into some strange doubletalk), and its tone, since its inception, has been ever more hopelessly militant, full of warnings, appeals, and open letters to the government —which, to no one's surprise, are not answered—and the same rather pathetic preoccupation with prominent negroes and what they are doing. Columns signed by Lena Horne and Paul Robeson appeared in *PV* until several weeks ago, when both severed their connections with the paper. Miss Horne's column made her sound like an embittered Eleanor Roosevelt, and the only column of Robeson's I have read was concerned, pertinently enough, with the current witch-hunt in Hollywood, discussing the

kind of movies under attack and Hollywood's traditional treatment of Negroes. The implication, with which I agree, was that the House Un-American Activities Committee might find concepts more dangerous to America in a picture like *Gone with the Wind* than in the far less successful *Watch on the Rhine.*

THE only other newspapers in the field with any significant sale in Harlem are the *Pittsburgh Courier,* which has the reputation of being the best of the lot, and the *Afro-American,* which resembles the New York *Journal-American* in layout and type and seems to make a consistent if unsuccessful effort to be at once readable, intelligent, and fiery. The *Courier* is a high-class paper, reaching its peak in the handling of its society news and in the columns of George S. Schuyler, whose Olympian serenity infuriates me, but who, as a matter of fact, reflects with great accuracy the state of mind and the ambitions of the professional, well-to-do Negro who has managed to find a place to stand. Mr. Schuyler, who is remembered still for a satirical novel I have not read, called *Black No More,* is aided enormously in this position by a genteel white wife and a child-prodigy daughter—who is seriously regarded in some circles as proof of the incomprehensible contention that the mating of white and black is more likely to produce genius than any other combination. (The *Afro-American* recently ran a series of articles on this subject, "The Education of a Genius," by Mrs. Amarintha Work, who recorded in detail the development of her mulatto son, Craig.)

Ebony and *Our World* are the two big magazines in the field, *Ebony* looking and sounding very much like *Life,* and *Our World* being the black man's *Look. Our World* is a very strange, disorganized magazine indeed, sounding sometimes like a college newspaper and sometimes like a call to arms, but principally, like its more skillful brothers, devoted to the proposition that anything a white man can do a Negro can probably do better. *Ebony* digs feature articles out of such things as the "real" Lena Horne and Negro FBI agents, and it travels into the far corners of the earth for any news, however trivial, concerning any Negro or group of Negroes who are in any way unusual and/or newsworthy. The tone of both *Ebony* and *Our World* is affirmative; they cater to the "better class of Negro." *Ebony's* November issue carried an editorial entitled "Time To Count Our Blessings," which began by accusing Chester Himes (author of the recent novel *Lonely Crusade*) of having a color psychosis, and went on to explain that there are Negro racists also who are just as blind and dangerous as Bilbo, which is incontestably true, and that, compared to the millions of starving Europeans, Negroes are sitting pretty, which is, to say the least, a rather desperate comparison. The editorial concluded that Negroes had come a long way and that "as patriotic Americans" it was time "we" stopped singing the blues and realized just how bright the future was. These cheering sentiments were flanked—or underscored, if you will—by a photograph on the opposite page of an aging Negro farm woman carrying home a bumper crop of onions. It apparently escaped the editors of *Ebony* that the very existence of their magazine, and its table of contents for any month, gave the lie to this effort to make the best of a bad bargain.

The true *raison d'être* of the Negro press can be found in the letters-to-the-editor sections, where the truth about life among the rejected can be seen in print. It is the terrible dilemma of the Negro press that, having no other model, it models itself on the white press, attempting to emulate the same effortless, sophisticated tone—a tone its subject matter renders utterly unconvincing. It is simply impossible not to sing the blues, audibly or not, when the lives lived by Negroes are so inescapably harsh and stunted. It is not the Negro press that is at fault: whatever contradictions, inanities, and political infantilism can be charged to it can be charged equally to the American press at large. It is a black man's newspaper straining for recognition and a foothold in the white man's world. Matters are not helped in the least by the fact that the white man's world, intellectually, morally, and spiritually, has the meaningless ring of a hollow drum and the odor of slow death. Within the body of the Negro press all the wars and falsehoods, all the decay and dislocation and struggle of our society is seen in relief.

The Negro press, like the Negro, becomes the scapegoat for our ills. There is no dif-

ference, after all, between the *Amsterdam*'s handling of a murder on Lenox Avenue and the *Daily News*' coverage of a murder on Beekman Hill; nor is there any difference between the chauvinism of the two papers, except that the *News* is smug and the *Amsterdam* is desperate. Negroes live violent lives, unavoidably; a Negro press without violence is therefore not possible; and, further, in every act of violence, particularly violence against white men, Negroes feel a certain thrill of identification, a wish to have done it themselves, a feeling that old scores are being settled at last. It is no accident that Joe Louis is the most idolized man in Harlem. He has succeeded on a level that white America indicates is the only level for which it has any respect. We (Americans in general, that is) like to point to Negroes and to most of their activities with a kind of tolerant scorn; but it is ourselves we are watching, ourselves we are damning, or—condescendingly—bending to save.

I have written at perhaps excessive length about the Negro press, principally because its many critics have always seemed to me to make the irrational demand that the nation's most oppressed minority behave itself at all times with a skill and foresight no one ever expected of the late Joseph Patterson or expects now of the invincible Hearst; and I have tried to give some idea of its tone because it seems to me that it is here that the innate desperation is betrayed. As for the question of Negro advertising, which has caused so much comment, it seems to me quite logical that any minority identified by the color of its skin and the texture of its hair would eventually grow self-conscious about these attributes and avoid advertising lotions that made the hair kinkier and soaps that darkened the skin. The American ideal, after all, is that everyone should be as much alike as possible.

It is axiomatic that the Negro is religious, which is to say that he stands in fear of the God our ancestors gave us and before whom we all tremble yet. There are probably more churches in Harlem than in any other ghetto in this city and they are going full blast every night and some of them are filled with praying people every day. This, supposedly, exemplifies the Negro's essential simplicity and good-will; but it is actually a fairly desperate emotional business.

These churches range from the august and publicized Abyssinian Baptist Church on West 138th Street to resolutely unclassifiable lofts, basements, store-fronts, and even private dwellings. Nightly, holy roller ministers, spiritualists, self-appointed prophets and Messiahs gather their flocks together for worship and for strength through joy. And this is not, as *Cabin In The Sky* would have us believe, merely a childlike emotional release. The faith may be described as childlike, but the end it serves is often sinister. It may, indeed, "keep them happy" —a phrase carrying the inescapable inference that the way of life imposed on Negroes makes them quite actively unhappy — but also, and much more significantly, religion operates here as a complete and exquisite fantasy revenge: white people own the earth and commit all manner of abomination and injustice on it; the bad will be punished and the good rewarded, for God is not sleeping, the judgment is not far off. It does not require a spectacular degree of perception to realize that bitterness is here neither dead nor sleeping, and that the white man, believing what he wishes to believe, has misread the symbols. Quite often the Negro preacher descends to levels less abstract and leaves no doubt as to what is on his mind: the pressure of life in Harlem, the conduct of the Italian-Ethiopian war, racial injustice during the recent war, and the terrible possibility of yet another very soon. All these topics provide excellent springboards for sermons thinly coated with spirituality but designed mainly to illustrate the injustice of the white American and anticipate his certain and long overdue punishment.

Here, too, can be seen one aspect of the Negro's ambivalent relation to the Jew. To begin with, though the traditional Christian accusation that the Jews killed Christ is neither questioned nor doubted, the term "Jew" actually operates in this initial context to include all infidels of white skin who have failed to accept the Savior. No real distinction is made: the preacher begins by accusing the Jews of having refused the light and proceeds from there to a catalog of their subsequent sins and the sufferings visited on them by a wrathful God. Though the notion of the suffering is based on the

image of the wandering, exiled Jew, the context changes imperceptibly, to become a fairly obvious reminder of the trials of the Negro, while the sins recounted are the sins of the American republic.

At this point, the Negro identifies himself almost wholly with the Jew. The more devout Negro considers that he *is* a Jew, in bondage to a hard taskmaster and waiting for a Moses to lead him out of Egypt. The hymns, the texts, and the most favored legends of the devout Negro are all Old Testament and therefore Jewish in origin: the flight from Egypt, the Hebrew children in the fiery furnace, the terrible jubilee songs of deliverance: *Lord, wasn't that hard trials, great tribulations, I'm bound to leave this land!* The covenant God made in the beginning with Abraham and which was to extend to his children and to his children's children forever is a covenant made with these latter-day exiles also: as Israel was chosen, so are they. The birth and death of Jesus, which adds a non-Judaic element, also implements this identification. It is the covenant made with Abraham again, renewed, signed with his blood. ("Before Abraham was, I am.") Here the figure of Jesus operates as the intercessor, the bridge from earth to heaven; it was Jesus who made it possible, who made salvation free to all, "to the Jew first and afterwards the Gentile." The images of the suffering Christ and the suffering Jew are wedded with the image of the suffering slave, and they are one: the people that walked in darkness have seen a great light.

But if the Negro has bought his salvation with pain and the New Testament is used to prove, as it were, the validity of the transformation, it is the Old Testament that is clung to and most frequently preached from, which provides the emotional fire and anatomizes the pain of bondage; and which promises vengeance and assures the chosen of their place in Zion. The favorite text of my father, among the most earnest of ministers, was not "Father, forgive them, for they know not what they do," but "How can I sing the Lord's song in a strange land?"

But this same identification, which Negroes, since slavery, have accepted with their mothers' milk, serves, in contemporary actuality, to implement an involved and specific bitterness. Jews in Harlem are small tradesmen, rent collectors, real estate agents, and pawnbrokers; they operate in accordance with the American business tradition of exploiting Negroes, and they are therefore identified with oppression and are hated for it. I remember meeting no Negro in the years of my growing up, in my family or out of it, who would really ever trust a Jew, and few who did not, indeed, exhibit for them the blackest contempt. On the other hand, this did not prevent their working for Jews, being utterly civil and pleasant to them, and, in most cases, contriving to delude their employers into believing that, far from harboring any dislike for Jews, they would rather work for a Jew than for anyone else. It is part of the price the Negro pays for his position in this society that, as Richard Wright points out, he is almost always acting. A Negro learns to gauge precisely what reaction the alien person facing him desires, and he produces it with disarming artlessness. The friends I had, growing up and going to work, grew more bitter every day; and, conversely, they learned to hide this bitterness and to fit into the pattern Gentile and Jew alike had fixed for them.

THE tension between Negroes and Jews contains an element not characteristic of Negro-Gentile tension, an element which accounts in some measure for the Negro's tendency to castigate the Jew verbally more often than the Gentile, and which might lead one to the conclusion that, of all white people on the face of the earth, it is the Jew whom the Negro hates most. When the Negro hates the Jew *as a Jew* he does so partly because the nation does and in much the same painful fashion that he hates himself. It is an aspect of his humiliation whittled down to a manageable size and then transferred; it is the best form the Negro has for tabulating vocally his long record of grievances against his native land.

At the same time, there is a subterranean assumption that the Jew should "know better," that he has suffered enough himself to know what suffering means. An understanding is expected of the Jew such as none but the most naive and visionary Negro has ever expected of the American Gentile. The Jew, by the nature of his own precarious position, has failed to vindicate this faith. Jews, like Negroes, must use every possible

weapon in order to be accepted, and must try to cover their vulnerability by a frenzied adoption of the customs of the country; and the nation's treatment of Negroes is unquestionably a custom. The Jew has been taught —and, too often, accepts—the legend of Negro inferiority; and the Negro, on the other hand, has found nothing in his experience with Jews to counteract the legend of Semitic greed. Here the American white Gentile has two legends serving him at once: he has divided these minorities and he rules.

It seems unlikely that within this complicated structure any real and systematic cooperation can be achieved between Negroes and Jews. (This is in terms of the over-all social problem and is not meant to imply that individual friendships are impossible or that they are valueless when they occur.) The structure of the American commonwealth has trapped both these minorities into attitudes of perpetual hostility. They do not dare trust each other—the Jew because he feels he must climb higher on the American social ladder and has, so far as he is concerned, nothing to gain from identification with any minority even more unloved than he; while the Negro is in the even less tenable position of not really daring to trust anyone.

This applies, with qualifications and yet with almost no exceptions, even to those Negroes called progressive and "unusual." Negroes of the professional class (as distinct from professional Negroes) compete actively with the Jew in daily contact; and they wear anti-Semitism as a defiant proof of their citizenship; their positions are too shaky to allow them any real ease or any faith in anyone. They do not trust whites or each other or themselves; and, particularly and vocally, they do not trust Jews. During my brief days as a Socialist I spent more than one meeting arguing against anti-Semitism with a Negro college student, who was trying to get into civil service and was supporting herself meanwhile as a domestic. She was by no means a stupid girl, nor even a particularly narrow-minded one: she was all in favor of the millennium, even to working with Jews to achieve it; but she was not prepared ever to accept a Jew as a friend. It did no good to point out, as I did, that the exploitation of which she accused the Jews was American, not Jewish, that in fact, behind the Jewish face stood the American reality. And *my* Jewish friends in high school were not like that, I said, they had no intention of exploiting *me*, we did not hate each other. (I remember, as I spoke, being aware of doubt crawling like fog in the back of my mind.) This might all be very well, she told me, we were children now, with no need to earn a living. Wait until later, when your friends go into business and you try to get a job. You'll see!

It is this bitterness—felt alike by the inarticulate, hungry population of Harlem, by the wealthy on Sugar Hill, and by the brilliant exceptions ensconced in universities—which has defeated and promises to continue to defeat all efforts at inter-racial understanding. Oppression—the social and political optimists to the contrary—does not imbue a people with wisdom or insight or sweet charity: it breeds in them instead a constant, blinding rage. Just as a mountain of sociological investigations, committee reports, and plans for recreational centers have failed to change the face of Harlem or prevent Negro boys and girls from growing up and facing, individually and alone, the unendurable frustration of being always, everywhere, inferior—until finally the cancer attacks the mind and warps it—so there seems no hope for better Negro-Jewish relations without a change in the American pattern.

Both the Negro and the Jew are helpless; the pressure of living is too immediate and incessant to allow time for understanding. I can conceive of no Negro native to this country who has not, by the age of puberty, been irreparably scarred by the conditions of his life. All over Harlem, Negro boys and girls are growing into stunted maturity, trying desperately to find a place to stand; and the wonder is not that so many are ruined but that so many survive. The Negro's outlets are desperately constricted. In his dilemma he turns first upon himself and then upon whatever most represents to him his own emasculation. Here the Jew is caught in the American crossfire. The Negro, facing a Jew, hates, at bottom, not his Jewishness but the color of his skin. It is not the Jewish tradition by which he has been betrayed but the tradition of his native land. But just as a society must have a scapegoat, so hatred must have a symbol. Georgia has the Negro and Harlem has the Jew.

Economic Survey of the South

Article No. 18—THE FUTURE OF THE MILL VILLAGE ON THE SOUTH

South's Company Towns Bow To New Pattern of Living

Chief, Washington Bureau,
Fairchild Publications

The mill village of the South, as a sociological problem, is rapidly passing, even though it may continue to exist physically for some years in the future.

This does not imply, by any means, that every cotton mill organization in the South is planning to dispose of its villages. That is far from the case, although there is a well-developed movement along these lines which is gaining momentum.

Rather, a group of diverse but interrelated influences, springing from the changing economic conditions of the South as a whole, are operating to lessen the need for such an institution as the mill village, or to make it uneconomic. In time, therefore, these villages will probably disappear physically as well as sociologically.

In this aspect of its development, the cotton textile industry of the South apparently will duplicate the experience of the industry in New England, as it has in so many other phases.

In the meanwhile, the Southern mill village, in many areas of the region, continues, like the vermiform appendix in the human body, to exist physically but not to function.

Like that organ, however, it can still give occasional trouble to its owner and to the community.

The foregoing is not intended to imply that the cotton textile industry is the only Southern industry which the force of circumstances has saddled with a once-necessary adjunct (the mill village) which has now become an Old Man of the Sea.

The mill village, under the name of the company town, also is a phenomenon of the Southern coal-mining industry, its aluminum industry, its lumber industry, the rayon industry (to some extent) and even of the Federal Government.

Nor is there by any means a

An aerial view of the Fairfax plant of West Point Manufacturing Co. and portion of its mill village.

wright-type spinning machinery.

It was based on the British idea of employing the entire family in the cotton mill—father, mother and children. That was the system of recruiting cotton mill labor which grew up in Rhode Island as the cotton textile industry developed, and it was this ed, in common with the general system of mill organization and operation then prevalent in New England, since so many of the conditions which prevailed in New England when the industry was established were also to be found in the South.

When the first Southern mills were established the only motive power available was that of falling water, and to make use of such power it was frequently necessary to establish a mill at a water power site where no previous community existed. It was therefore necessary for the founders of the first Southern cotton mills to establish not only mill villages to house their employes (who came to the mill from the mountains and back country farms in family units) but also company stores at which their day-to-day needs in the way of groceries, meats and clothing could be supplied.

Thus two phenomena were established which were for a long time to make the cotton textile industry the target of attacks by sociologists and reformers. While the company store has largely passed out of existence as an adjunct of cotton textile organizations, the mill village is still a

petus by the fact that the newer industries of the South, such as the hosiery industry, the woolen and worsted industry, the cotton garment industry, the paper industry and the chemical industry have established their plants without any arrangements for housing their employes (other than managerial and supervisory) and have depended upon the magnet of comparatively well-paid employment plus existing or supplemented transportation facilities, to bring them all the employes they may need.

In no single instance, thus far, have they been disappointed. Even where the necessary work force runs into thousands, as it does at a rayon plant, there have always been (and still are) plenty of workers available, and the means of getting them to and from the plant (even for second and third shift operations) has always been available or has come into existence.

The daily increasing employment of these new industries has been in itself a powerful influence impelling cotton mill workers to leave the mill village for their own homes—even the best of them.

For, no matter how fine the houses, how modern their conveniences, how many perequisites their occupants receive from the mill management, the mill village is still a paternalistic institution, and will probably be increasingly recognized as such by the cotton mill worker as his education continues to improve and his industrial experience broadens. The fact that his relatives and friends who are employed in rayon plants, hosiery mills, cotton garment plants, etc., live in their own homes rather than in a company house exerts a strong influence on him to do likewise.

Even more important, the economic condition of the average cotton mill worker has been such for the past eight or nine years, that he could for the first time

cause the passing of the mill village. There are others, however,

2. Of these, the most important is the definite policy on the part of some of the largest textile mill organizations in the South to divest themselves of the social and financial burden of the mill village.

Outstanding in this group has been the now gigantic Burlington Mills organization, whose dynamic president, Spencer Love, has pursued this policy from the time that he acquired his first cotton mill in Gastonia. He quickly disposed of the mill village which he acquired as a result of that transaction, and has followed the same policy consistently ever since.

Another important mill group to dispose of its mill villages during the past decade is the Marshall Field organization in North Carolina and Virginia, which in 1941 disposed of its mill villages at Leaksville, Spray and Draper, N. C., and at Fieldale, Va.

Still another is the Callaway Mills organization, which in 1945 disposed of its mill villages at La Grange and other Georgia communities.

Other equally large mill organizations disposed of some of their mill village holdings prior to or even during the war, and, while some have apparently regretted and abandoned this policy, there are indications that others are planning to resume or adopt it in the near future.

In almost every instance, the sale of mill village homes has been to families employed in the mill; usually to the occupants of the house itself.

RECORD SALES

One well-informed individual who has followed this movement closely estimates that during the past 12 years from 15,000 to 20,000 mill village houses in the South have been sold by cotton textile mills. The head of one real estate firm which has specialized in handling the details of such transactions for the mills, Mrs. Hugh Pinnix of the Hugh

DAILY NEWS RECORD, SATURDAY, FEBRUA

South's Company Towns Bow To New Pattern of Living

By HARRY E. RESSEGUIE
Chief, Washington Bureau,
Fairchild Publications

The mill village of the South, as a sociological problem, is rapidly passing, even though it may continue to exist physically for some years in the future.

This does not imply, by any means, that every cotton mill organization in the South is planning to dispose of its villages. That is far from the case, although there is a well-developed movement along these lines which is gaining momentum.

Rather, a group of diverse but interrelated influences, springing from the changing economic conditions of the South as a whole, are operating to lessen the need for such an institution as the mill village, or to make it uneconomic. In time, therefore, these villages will probably disappear physically as well as sociologically.

In this aspect of its development, the cotton textile industry of the South apparently will duplicate the experience of the industry in New England, as it has in so many other phases.

In the meanwhile, the Southern mill village, in many areas of the region, continues, like the vermiform appendix in the human body, to exist physically but not to function.

Like that organ, however, it can still give occasional trouble to its owner and to the community.

The foregoing is not intended to imply that the cotton textile industry is the only Southern industry which the force of circumstances has saddled with a once-necessary adjunct (the mill village) which has now become an Old Man of the Sea.

The mill village, under the name of the company town, also is a phenomenon of the Southern coal-mining industry, its aluminum industry, its lumber industry, the rayon industry (to some extent) and even of the Federal Government.

Nor is there by any means a unanimity of opinion in the cotton textile industry of the South regarding the future of the mill village.

Some mill organzations, which have no intention of expanding their present mill villages, have equally no intention at the moment of selling them—to their employes or to any one else.

Others, seemingly moving against the tide, are vigorously expanding their present mill villages or building new ones, even at the present high costs of residential construction. Even in these instances, however, as will be made clear, this current expansion is of a type which eliminates many of the traditional evils commonly associated with the mill village as a social phenomenon.

In tracing the divergent views which the Southern cotton textile industry itself holds concerning the mill village and its future, very definite geographical lines are revealed.

The trend on the part of cotton mill organizations to divest themselves of the financial and sociological responsibilities of the mill village is, like unionism, moving South from the Northern edge of the region.

It is particularly marked in North Carolina, Virginia and in Tennessee. Most (although not all) of the mill villages which were sold in the years immediately preceding World War II were in the first two of these States. It is in all three of these that the movement is being resumed in the postwar era.

On the other hand, in the States of South Carolina, Alabama and Georgia, few cotton textile organizations indicate any intention of disposing of their mill villages, now or in the future. It is in these States, also, that most of the mill village expansion now under way is taking place. It is in this area that the mill village gives promise of continuing the longest in its present form.

In order to understand the mill village as a social phenomenon it is necessary to glance briefly at its origins in this country.

TRACE ORIGINS

It was brought to this country from England and first domesticated in Rhode Island by Samuel Slater, the father of the cotton textile industry in the United States, who also gave the embryonic textile industry its first Arkwright-type spinning machinery.

An aerial view of the Fairfax plant of West Point Manufacturing Co. and portion of its mill village.

It was based on the British idea of employing the entire family in the cotton mill—father, mother and children. That was the system of recruiting cotton mill labor which grew up in Rhode Island as the cotton textile industry developed, and it was this system, plus the fact that, as the industry grew, increasing numbers of mills were established at water power sites where no village or town had previously existed, that caused the growth of the mill village in that section of New England.

On the other hand, when Francis Cabot Lowell (who developed the first power looms in this country) and Patrick Tracy Jackson established the cotton mills in Massachusetts which resulted in the founding of the City of Lowell and other cotton mill towns of the region, they introduced a new system of labor recruiting as well as a new type of cotton mill.

Their system was based on the employment of single individuals in their mills, rather than families. These were mostly young women from the surrounding farms.

The company boarding house, rather than the mill village, became the basic domicile for the cotton mill employes of Lowell and the other new textile towns of Massachusetts and New Hampshire.

There were advantages to this system over that of the English or Rhode Island system, based on the mill village, many sociologists feel.

It prevented the establishment of a permanent mill village population, set off socially and economically from theh populations of the other communities of the area, since, under the Lowell system, few of the young women worked more than a few years in the mills, during which time they saved a nest-egg; then returned to their homes and were married.

However, the Lowell system passed out of existence about the time of the Civil War, when the French Canadians, the first of many foreign nationalities, were brought in to supply the need for additional textile mill operatives.

From that time on, until the mill village began to dwindle and pass out of existence in New England (as it is now beginning to do in the South) the unit of employment in the New England mills was the family, rather than the individual.

ADOPT SYSTEM

It was only to be expected, therefore, that, when the cotton textile industry began to develop in the South, the mill village and the system of the family as the employment unit would be adopted system of mill organization and operation then prevalent in New England, since so many of the conditions which prevailed in New England when the industry was established were also to be found in the South.

When the first Southern mills were established the only motive power available was that of falling water, and to make use of such power it was frequently necessary to establish a mill at a water power site where no previous community existed. It was therefore necessary for the founders of the first Southern cotton mills to establish not only mill villages to house their employes (who came to the mill from the mountains and back country farms in family units) but also company stores at which their day-to-day needs in the way of groceries, meats and clothing could be supplied.

Thus two phenomena were established which were for a long time to make the cotton textile industry the target of attacks by sociologists and reformers. While the company store has largely passed out of existence as an adjunct of cotton textile organizations, the mill village is still a vital, even if vanishing, part of the Southern economy.

The influences which are operating in the South today to eliminate the mill village entirely or to change its traditional character so completely as to accomplish almost the same effect, include the following:

1. Most important of all is the new pattern of living on the part of mill and factory workers in the South, which has been referred to frequently in this series.

This is based on improved transportation, such as the automobile and the public bus line; on the extension to rural areas of conveniences formerly enjoyed only by organized communities, such as electric light and power, running water, etc.

These and other innovations have made possible a pattern of rural living which enables mills and factories to draw their employes from a 30- to 40-mile radius, rather than from only the immediate area of the mill itself.

As a result, thousands of families have, during the past decade, left even the best mill villages in the South, to build homes of their own on small plots of land within easy commuting distance of the mill.

This trend has been given impetus by the fact that many industries of the South, such as the hosiery industry, the woolen and worsted industry, the cotton garment industry, the paper industry and the chemical industry have established their plants without any arrangements for housing their employes (other than managerial and supervisory) and have depended upon the magnet of comparatively well-paid employment plus existing or supplemented transportation facilities, to bring them all the employes they may need.

In no single instance, thus far, have they been disappointed. Even where the necessary work force runs into thousands, as it does at a rayon plant, there have always been (and still are) plenty of workers available, and the means of getting them to and from the plant (even for second and third shift operations) has always been available or has come into existence.

The daily increasing employment of these new industries has been in itself a powerful influence impelling cotton mill workers to leave the mill village for their own homes—even the best of them.

For, no matter how fine the houses, how modern their conveniences, how many perequisites their occupants receive from the mill management, the mill village is still a paternalistic institution, and will probably be increasingly recognized as such by the cotton mill worker as his education continues to improve and his industrial experience broadens. The fact that his relatives and friends who are employed in rayon plants, hosiery mills, cotton garment plants, etc., live in their own homes rather than in a company house exerts a strong influence on him to do likewise.

Even more important, the economic condition of the average cotton mill worker has been such for the past eight or nine years, that he could for the first time indulge such an ambition, when it had been inspired within him.

Consequently, thousands have taken up the new pattern of living in the past few years; more will do so in the future as home construction costs are stabilized and lowered. Many mill operatives, however, have the traditional American facility with tools and are able to do most of the work on their own homes, without waiting for lower costs.

MILL OWNERS HELP

To a considerable degree, this movement has been stimulated by the mill owners themselves, many of whom have either loaned money to their employes for home building or purchase, or have helped them to secure such loans from commercial or Governmental institutions.

Some of the cotton textile operatives who take up the new pattern of living, conduct part-time farming operations as a sideline—for which those on the second and third shifts, particularly, have plenty of time. A larger number, however, simply utilize their new environment to supplement the table from a garden, a few chickens and, possibly, a cow and a few pigs.

So impelling is the movement toward this new pattern of living that it might, in time, of itself village. There are others, however,

2. Of these, the most important is the definite policy on the part of some of the largest textile mill organizations in the South to divest themselves of the social and financial burden of the mill village.

Outstanding in this group has been the now gigantic Burlington Mills organization, whose dynamic president, Spencer Love, has pursued this policy from the time that he acquired his first cotton mill in Gastonia. He quickly disposed of the mill village which he acquired as a result of that transaction, and has followed the same policy consistently ever since.

Another important mill group to dispose of its mill villages during the past decade is the Marshall Field organization in North Carolina and Virginia, which in 1941 disposed of its mill villages at Leaksville, Spray and Draper, N. C., and at Fieldale, Va.

Still another is the Callaway Mills organization, which in 1945 disposed of its mill villages at La Grange and other Georgia communities.

Other equally large mill organizations disposed of some of their mill village holdings prior to or even during the war, and, while some have apparently regretted and abandoned this policy, there are indications that others are planning to resume or adopt it in the near future.

In almost every instance, the sale of mill village homes has been to families employed in the mill; usually to the occupants of the house itself.

RECORD SALES

One well-informed individual who has followed this movement closely estimates that during the past 12 years from 15,000 to 20,000 mill village houses in the South have been sold by cotton textile mills. The head of one real estate firm which has specialized in handling the details of such transactions for the mills, Mrs. Hugh Pinnix of the Hugh Pinnix Realty Co., Greensboro, N. C., says that, during this period, her firm alone has sold approximately 10,000 houses in mill villages.

The number of houses still under mill ownership would not be available without a complete survey of every mill organization in the South. So far as is known, no census of housing ever has segregated homes by this type of ownership. However, since a partial one by BLS in 1917 a rough estimate can be made.

It is improbable that more than 50 per cent of the cotton textile workers in the South are still housed in company-owned villages. Some mills house a higher percentage of their employes than this, but almost none house as many as 75 per cent, and a number provide mill village homes for less than 50 per cent of their workers. Therefore, assuming that 50 per cent of the cotton textile workers in the South are still living in mill villages and further assuming two workers per house, the number of company-owned houses, including those sold in the last decade, probably numbered originally about 90,000.

3. One of the most potent of all the long-range influences operating to bring about the possible disappear-

ance of the mill village in the South may be the widespread modernization of the villages which began during the war and is still continuing. Paradoxically enough, one of the principal reasons for this modernization was to make the mill village more attractive to mill employes, and thus stimulate the flagging interest in cotton mill jobs.

Currently, this modernization has improved the appearance of some of the poorer villages to a remarkable degree, and has made them, both physically and esthetically, a much pleasanter place in which to live.

MRS. HUGH PINNIX

A specialist in the sale of mill villages, Mrs. Pinnix has sold 10 of them for four large textile firms, comprising more than 3,600 homes.

Houses have been painted, brick or lattice curtains placed around the foundations, streets have been

modern, landscaped villages, the Loray village was probably not much worse than the average of the older mill villages in the South.

Today, the mill is still under absentee ownersip, since it belongs to the Firestone Tire & Rubber Co.

Physically, though, the mill village is greatly changed and has been since it passed into the hands of its present owners. Streets have been paved, grass and shrubbery planted, houses painted, curtains built about the foundations, bathrooms and other plumbing installed, and, in general, here is a modern town.

Yet, as this village was representative of all but the newest of the Southern mill villages in 1929, today it is still representative of the average cotton mill village in the South, so widespread has been the general modernization program. The houses do not compare, of course, with those that Elliott Springs of the Springs Cotton Mills is building at Lancaster, S. C., nor those that James Self, of the Greenwood Cotton Mills, is building at Greenwood, S. C. They probably do not compare with the houses of some of the best villages built in the 1930s and since kept up to date, such as those in some of the villages of the West Point Manufacturing Co., for instance, but they do compare favorably with commercial properties which are rented at much higher rentals.

For, notwithstanding all of this modernization and village improvement, rents in Southern mill villages still range only from 50 to 75 cents a room per week. In some of the finest and most recently built villages an additional charge of 50 cents a week for the bathroom and 50 cents a week for a garage, where one is included, are made. Commercial rents for comparable houses, if available, would be $35 to $40 a month, or higher.

QUESTION CLAIM.

This has provided an undeniable

many mill owners to whom the writer talked in the course of the survey on which this article is based expressed their intention of eventually taking steps in this direction.

Some mill owners who feel that this is a sound policy have been deterred from putting it into operation because (a) at the present level of operation there is still no great surplus of cotton textile labor in the South and (b) many of the mill villages are in rent control areas and their rents, along with commercial rents, are still frozen. With a slowing down of operations and the removal of rent controls, however, higher rents for mill village homes are inevitable.

WAITING LIST.

That the present differential between mill village rents and commercial rents for comparable homes is currently very great, however, is best illustrated by the great number of applications for houses from employes not now housed in company homes, which every owner of a good mill village now has on his waiting list.

And this situation, in turn, serves to emphasize one of the minor phenomena of the mill village situation in the South, which is that, even though few mill owners can house more than half of their employes, and a rent perquisite thus goes to only a part of their workers, there is no demand on the part of those who do not live in company houses for higher wages to offset this unquestioned financial advantage.

One reason, of course, is that mill village homes are allotted on a seniority basis, with the older employes having the first opportunity but, in itself this phenomenon may indicate that many employes prefer to live outside the village even at a relatively great cost, and possibly even with poorer accommodations.

4. Another influence which is changing the character of

They, therefore, made arrangements to re-meter electricity to their mill village houses or, in many instances, turned this service over to the local public utility. An executive of the Duke Power Co. told the writer last year that his company had taken over service to many mill villages in the Carolinas in the last five years, and the same situation can be found in other Southern textile States.

Free water was next to go; particularly in mill villages which are within the city limits of large municipalities, as is the case in Greensboro, Greenville, Atlanta, Birmingham and other cases. Here, too, the mill either remeters city water to its employes, or divorces itself from the service altogether and lets the city install the meters.

On the other hand, some mill organizations, such as the West Point Manufacturing Co., have as many as a thousand commercial customers of their own water supply systems, in the form of retail and other businesses which have grown up near the mill and its villages and which have no other source of supply.

pared to sell their own villages, nevertheless encourage their employes to buy homes of their own, sometimes even building a group of such homes in advance of the demand and selling them on long-term plans at simple interest.

Hugh Comer, president of Avondale Mills, which operates a group of mills in Alabama and owns one mill village within the city limits of Birmingham, said recently that his company had offered any family in this village the house in which it lived, if it would buy a five-acre plot of land outside the city limits and move the house to the new location.

Some families have taken advantage of the offer, although not all. However, Mr. Comer says that his company is considering making the same offer to residents of its other villages.

About 1,100 Avondale employes — one-sixth of the total — have bought or are buying their own homes, including some of its Negro workers, J. Craig Smith, executive vice-president of the organization, told the writer last fall. Many of these transactions have been financed by Avondale, which will

This is one of the better-type homes provided for some of the South's coal miners.

South may be the widespread modernization of the villages which began during the war and is still continuing. Paradoxically enough, one of the principal reasons for this modernization was to make the mill village more attractive to mill employes, and thus stimulate the flagging interest in cotton mill jobs.

Currently, this modernization has improved the appearance of some of the poorer villages to a remarkable degree, and has made them, both physically and esthetically, a much pleasanter place in which to live.

MRS. HUGH PINNIX

A specialist in the sale of mill villages, Mrs. Pinnix has sold 10 of them for four large textile firms, comprising more than 3,600 homes.

Houses have been painted, brick or lattice curtains placed around the foundations, streets have been paved, shrubbery planted, porches added, bathrooms and other inside plumbing facilities installed, interior walls have been painted or papered, and a general face-lifting given the individual houses and the villages themselves.

INCENTIVES.

The mills had two incentives to carry out this modernization. One was that, during the war, so many other industries not only paid higher wages, but furnished more pleasant employment which gave workers a higher social status—that it was necessary to make the mill villages pleasanter places in which to live in order to meet this competition from other industries. Even with these improvements mills would have been hard pressed during the worst of the man-power shortage to retain their workers had not the housing situation in war-production cities been so tight. The mill villages, therefore, played a definite part in enabling Southern cotton mills to play the important part which they did in war production.

Another reason, of course, was that the cost of this modernization could be charged off to operating expenses, and thus was little direct expense to the mills themselves.

Even before the war a considable amount of such modernization had been done. The writer, who was assigned in 1929 to cover the strike at the Loray mill of the Manville-Jencks Co. at Gastonia will never forget the contrast between the mill village as it was then and the next time he saw it, in November 1947.

In 1929, the streets were unpaved, there were no lawns and few trees and the ground throughout the village was badly eroded. The houses, largely built on sidehills, were supported by pilings, with no curtains around the foundation. Toilets were outside, running water was received through a single cold-water faucet, and a few bare incandescents provided artificial illumination. Rents were about 25 cents a room per week, then the standard for mill-village homes. Possibly this description does the village an injustice, but, after nearly 20 years, the strong impression that it was a dismal and depressing place to live still remains.

The fact that the mill was owned by a New England organization and was under absentee management was in part responsible for these conditions, and yet, while some Southern mill organizations had begun just about that time or shortly before to build the older mill villages in the South.

Today, the mill is still under absentee ownersip, since it belongs to the Firestone Tire & Rubber Co.

Physically, though, the mill village is greatly changed and has been since it passed into the hands of its present owners. Streets have been paved, grass and shrubbery planted, houses painted, curtains built about the foundations, bathrooms and other plumbing installed, and, in general, here is a modern town.

Yet, as this village was representative of all but the newest of the Southern mill villages in 1929, today it is still representative of the average cotton mill village in the South, so widespread has been the general modernization program. The houses do not compare, of course, with those that Elliott Springs of the Springs Cotton Mills is building at Lancaster, S. C., nor those that James Self, of the Greenwood Cotton Mills, is building at Greenwood, S. C. They probably do not compare with the houses of some of the best villages built in the 1930s and since kept up to date, such as those in some of the villages of the West Point Manufacturing Co., for instance, but they do compare favorably with commercial properties which are rented at much higher rentals.

For, notwithstanding all of this modernization and village improvement, rents in Southern mill villages still range only from 50 to 75 cents a room per week. In some of the finest and most recently built villages an additional charge of 50 cents a week for the bathroom and 50 cents a week for a garage, where one is included, are made. Commercial rents for comparable houses, if available, would be $35 to $40 a month, or higher.

QUESTION CLAIM.

This has provided an undeniable perquisite for Southern cotton mill workers domiciled in mill villages. At various times, the low rents charged for mill village homes have been cited by Southern mill owners as one of the justifications for a lower wage scale in the South. This claim has been questioned in the past by both sociologists and union officials, because of the low grade of housing provided.

However there are few mill villages in the South today where this perquisite is not an actual one, particularly when the greatly increased wages of Southern textile workers are taken into consideration. At present wage levels, and with probably five hours of overtime per week, a family with three members employed (not unusual) may earn from $150 to $200 a week before income tax and social security deductions, so that a rent of from $10 to $15 a month for a modern house is extremely nominal.

That perquisites of this amount are bound to be reduced in the future, however, is apparent to most observers.

Mills are being urged to put their mill villages on a basis where they will not only return the expense of operation and maintenance (which most of them do now) but also the interest on the investment (very rare today) or even a profit.

Dr. William P. Jacobs, president of the American Association of Cotton Manufacturers, has urged this at the last two annual conventions of his association, and based expressed their intention of eventually taking steps in this direction.

Some mill owners who feel that this is a sound policy have been deterred from putting it into operation because (a) at the present level of operation there is still no great surplus of cotton textile labor in the South and (b) many of the mill villages are in rent control areas and their rents, along with commercial rents, are still frozen. With a slowing down of operations and the removal of rent controls, however, higher rents for mill village homes are inevitable.

WAITING LIST.

That the present differential between mill village rents and commercial rents for comparable homes is currently very great, however, is best illustrated by the great number of applications for houses from employes not now housed in company homes, which every owner of a good mill village now has on his waiting list.

And this situation, in turn, serves to emphasize one of the minor phenomena of the mill village situation in the South, which is that, even though few mill owners can house more than half of their employes, and a rent perquisite thus goes to only a part of their workers, there is no demand on the part of those who do not live in company houses for higher wages to offset this unquestioned financial advantage.

One reason, of course, is that mill village homes are allotted on a seniority basis, with the older employes having the first opportunity but, in itself this phenomenon may indicate that many employes prefer to live outside the village even at a relatively great cost, and possibly even with poorer accommodations.

4. Another influence which is changing the character of the mill village, and which may aid in possible disappearance in the future, is the withdrawal of perquisites other than low rent from their employes by mill owners.

In the past, these perquisites have included free electricity, free water, coal and other fuel at cost, free garbage collection and other municipal services. They have collectively comprised another factor which has frequently been cited as a basis for the continuance of the North-South wage differential.

Here is one of the new $11,000 houses being built for employes by the Springs Cotton Mills, Lancaster, S. C., designed to rent for 75 cents a room a week, plus 50 cents a week each for bath and garage.

Today, as a result of the increased cost of continuing such perquisites, many mills have discontinued most or all of the first three listed above. Other mill owners probably will follow suit in the near future.

Free electricity was the first to go.

When all of the electricity used by a mill village family was that consumed by three or four 40-watt incandescents, mills thought nothing of furnishing free electricity to their entire village.

But, as increased wages enabled mill village families to purchase electric irons, refrigerators, washing machines, electric ranges, fans, heaters, etc., power consumption mounted in the mill village as it has throughout the Nation generally and the South in particular. Even though electric rates are generally lower in the South than elsewhere, most mill owners even before the war found this mounting expense too great to continue.

many instances, turned this service over to the local public utility. An executive of the Duke Power Co. told the writer last year that his company had taken over service to many mill villages in the Carolinas in the last five years, and the same situation can be found in other Southern textile States.

Free water was next to go; particularly in mill villages which are within the city limits of large municipalities, as is the case in Greensboro, Greenville, Atlanta, Birmingham and other cases. Here, too, the mill either remeters city water to its employes, or divorces itself from the service altogether and lets the city install the meters.

On the other hand, some mill organizations, such as the West Point Manufacturing Co., have as many as a thousand commercial customers of their own water supply systems, in the form of retail and other businesses which have grown up near the mill and its villages and which have no other source of supply.

Fuel at cost is another perquisite which many mills are now in the process of withdrawing from their employes.

During the past year the Cone organization, which operates the Proximity Mill at Greensboro and a number of other cotton mills throughout North Carolina, took this step. The Cone organization had for many years supplied its employes with coal and wood at cost, but last year notified its employes that it would end the practice and has since arranged with some of the local suppliers to take over this business, which they were happy to do.

The Cone move will unquestionably be followed by other mills, as it has been preceded by similar action on the part of others. The Bibb Manufacturing Co., for instance, long ago turned the fuel franchises in their villages over to local dealers, or to the men's club of the village.

Certain of the municipal functions performed by mill owners for their villages cannot be discontinued, as, for instance, garbage collection, but it is conceivable that in the future a charge may even be made to the occupants of the houses for this service, unless the rents are raised to a high enough level to cover at least the cost of such service.

The loss of these perquisites, even though they are partially compensated for by higher wages and better houses, unquestionably makes the mill village less attractive to many cotton mill employes than formerly, and as their elimination becomes general and rents are increased, the trend toward individual home ownership probably will become more marked.

5. Another influence working to shorten the future life of the mill village stems from mill owners themselves who, while not at the moment pre-

of their own, sometimes even building a group of such homes in advance of the demand and selling them on long-term plans at simple interest.

Hugh Comer, president of Avondale Mills, which operates a group of mills in Alabama and owns one mill village within the city limits of Birmingham, said recently that his company had offered any family in this village the house in which it lived, if it would buy a five-acre plot of land outside the city limits and move the house to the new location.

Some families have taken advantage of the offer, although not all. However, Mr. Comer says that his company is considering making the same offer to residents of its other villages.

About 1,100 Avondale employes — one-sixth of the total — have bought or are buying their own homes, including some of its Negro workers, J. Craig Smith, executive vice-president of the organization, told the writer last fall. Many of these transactions have been financed by Avondale, which will continue to do so in the future if necessary, since it is firmly convinced of the soundness of individual home ownership. However, since a number of Federal credit unions have been organized by the employes, the mill prefers that a prospective home owner obtain his funds from this source. If the mill is to finance the transaction, it prefers that the employe invest at least 10 per cent of his own money. The mill will loan the balance at 4 per cent simple interest.

This is one of the better-type homes provided for some of the South's coal miners.

Springs Cotton Mills, of Lancaster, S. C., is another Southern mill organization which encourages its employes to own their own homes and is willing to help them do so, although it is also one of the few mill organizations which is enlarging its mill villages at the moment.

PREFER TO RENT

Elliott Springs, president, says that his organization always has a number of houses on the outskirts of its villages which it is willing to sell to its employes, but that most of them prefer to rent—a fact that is understandable when the high quality of the Springs houses and their low rents are considered.

The July 30, 1947, issue of The Springs Bulletin, the mill's house organ, which contained a history of the firm's Lancaster mill, carried an interesting sidelight on this situation in describing the workers at the plant.

It said in part:

"They have never lived anywhere else than Lancaster County and each family still owns a farm and expects to return to it when wages go down and cotton goes up. That is one reason why none of them are anxious to buy the present company furnished houses and they are smart enough to know that, so long as they can

rent them for 50 cents a room a week, they would lose money by buying their own."

Not all cotton mill workers are as fortunate, of course, as those of the Springs Mills in having a family farm to return to in hard times. Most of them originally came from the farm, but, in most cases, the farm was disposed of when the first generation moved to the mill village, and, in some instances, that is three generations ago.

While the spontaneous movement out of the mill village is principally on the part of families which buy outlying acreage and build their own house or have it built for them, nevertheless, mill owners such as the Comers and Elliott Springs have been responsible for much home ownership on the part of their employes.

There are many mill owners who have loaned substantial sums to their employes to enable the purchase of homes, and who will continue to do so as long as there is a demand for such assistance.

A view of Enka Village, Enka, N. C.

Others have under consideration plans for the erection of a number of houses as soon as construction costs are stabilized, which they plan to sell to their employes at a nominal price, with payments extended over a period of years.

From the foregoing discussion, it is apparent that a number of

among other things constructed the largest bleachery in the South, a foundry, etc., all of which require additional workers.

The houses being built by James C. Self, president of the Greenwood and Matthews cotton mills at Greenwood, S. C., are on a par with those being built by Mr. Springs. It is a personal hobby with Mr. Self to provide the best possible homes for his employes, his friends say.

Mr. Self told the writer recently that Greenwood Mills were building 80-odd new brick houses in their Matthews Mill village. He described these as structures with five large rooms, hardwood floors, tile bathrooms, tiled porch floors and tiled roofs. These houses will rent to Greenwood Mills' employes for $10 a month.

"Our entire village has paved streets and sidewalks, and low rates for electric current," Mr. Self explained. "In addition to this, we run a community laundry where we do the family wash without charge to the workers."

Borden Mills, of Kingsport, Tenn., is another Southern cotton mill organization which is expanding its mill village, having started last year to construct 100 new homes on a 20-acre tract near Kingsport to supplement the 300 houses in its original village. A separate non-profit corporation, the Liberty Rental Housing Corp., was formed to handle this propo-

part of the mill's physical equipment, any loss in their operation can be charged off to operating costs.

RAYON INDUSTRY

While the mill village or other forms of company housing are by no means so definite a part of the policy of the rayon industry as they are in the Southern cotton textile industry, nevertheless many of the rayon companies with plants in the South have been drawn into such projects, to a greater or lesser degree.

du Pont, for instance, when it purchased the World War I smokeless powder plant at Old Hickory, Tenn., which later became its first rayon plant in the South, acquired a number of houses and dormitories which had been constructed to house the working force of this plant, about 12 miles from Nashville.

These houses, about 1,400 in number, have been retained by du Pont until now, and have, at various times, been remodeled and repaired. du Pont, however, has decided to rid itself of the incubus of this mill village and is now in the processs of sellling the houses to its employes.

One of the few instances in which a rayon firm establishing a plant in the South deliberately created a mill village in the image of the cotton mill pattern was that of the Tubize Co., at Rome, Ga., in the late 1920's. When the Celanese Corp. of America acquired the Tubize organization in 1946, it inherited this village, which it still operates. It has not yet announced any plans for disposing of it.

Celanese has not constructed any villages at the plants which it has itself located in the South. The closest it has come to this is at its Celco (Va.) plant, where it has donated the land for a privately-financed housing project in the nearby city of Pearisburg, Va., and is presumably also interested in the company which is constructing these houses for sale.

Incidentally, the experience of the sponsors of this housing project duplicates that of most others which have endeavored to build houses in large numbers under

have been increasing ever since the Celanese plant was announced.

"As a result landlords are gouging right and left," Mr. Edelman told the committee. "This trend was noted just before the Emergency Price Control Act expired. We tried desperately to have controls extended to the area at that time. OPA had no funds to make the survey which was necessary to justify imposition of ceilings. Under the present act, of course, nothing could be done.

"Most of the houses I saw on which the rents had been raised were definitely substandard either lacking indoor plumbing and of flimsy construction or in poor repair. The absence of paint on these dwellings, both inside and out, is depressing.

"If there are screens on the houses, the tenants have to pay for these themselves. Most tenants buy their own stoves for heating and cooking."

Mr. Edelman later informed the writer that the houses he described at Rock Hill were commercially owned, not mill village homes.

The great influx of construction workers at Morristown, Tenn., as a result of the construction of the new American Enka plant nearby, has created a congested housing situation in the city also, although the mayor of the village told the writer he expects this situation to improve as soon as the construction crews leave town. In the construction of the new du Pont nylon plant near Chattanooga, Tenn., this situation has not become so aggravated, since local construction labor has been used to a greater degree.

At its original plant at Enka, N. C., near Asheville, the American Enka Corp. has a company-owned housing project, which dates from the establishment of the plant in 1928. This village contains approximately 150 houses, which are rented only to employees of the firm.

The key employes of the plant live in the village. Their cottages are more or less individual in design, ranging from small three- or four-room cottages to two-story dwellings. They are a mixture of wood, stone and stucco and are described by an Asheville newspaper man as well and attractively land-

"The past year has marked great progress in the formalization and progressive betterment of personnel practices and policies in the textile industry looking toward a sounder, more harmonious relationship between the people who manage and the people who perform the production jobs in the mills in the industry. The prognosis for better human relationships in the textile industry during the coming year and for a lessening of the management-labor wars is very good."

—Frank A. Costangy, Attorney and Industrial Counsellor.

one which is currently engaged in disposing of such housing.

The Old Hickory houses range from a small, one-story, 6-room bungalow (originally covered with prepared roofing but now sheathed with wood siding) to some large, two-story houses, rather imposing in a turn-of-the-century type of architecture.

The poorest type of house (which has no cellar and no central heating) has been rented to employes for $12 a month.

The best type (of which there are only a half-dozen, occupied by the executive of the plant) has rented for $100 a month.

OTHER HOUSES

In between these extremes are others, of varying sizes and construction, which have rented for $14, $16, $25, $30 and $50 a month, depending upon their size and their conveniences. Those renting for the higher figures have been remodeled, have half-basements and oil heat.

Du Pont executives have for some time been engaged in working out a plan for disposing of these houses to their employes, as a part of which the number of houses in the village may be reduced from 1,400 to about 900, in order to give the new owners larger lots.

Preliminary steps such as deeding the land occupied by the local

week, they would lose money by buying their own."

Not all cotton mill workers are as fortunate, of course, as those of the Springs Mills in having a family farm to return to in hard times. Most of them originally came from the farm, but, in most cases, the farm was disposed of when the first generation moved to the mill village, and, in some instances, that is three generations ago.

While the spontaneous movement out of the mill village is principally on the part of families which buy outlying acreage and build their own house or have it built for them, nevertheless, mill owners such as the Comers and Elliott Springs have been responsible for much home ownership on the part of their employes.

There are many mill owners who have loaned substantial sums to their employes to enable the purchase of homes, and who will continue to do so as long as there is a demand for such assistance.

A view of Enka Village, Enka, N. C.

Others have under consideration plans for the erection of a number of houses as soon as construction costs are stabilized, which they plan to sell to their employes at a nominal price, with payments extended over a period of years.

From the foregoing discussion, it is apparent that a number of influences are at work to lessen the importance of the mill village and to some day bring about its demise.

However, in the face of this trend, there are mill organizations in the South which are, as had been indicated, going ahead with extensive expansions of their present villages, even at present high construction costs.

FINE HOMES

Moreover, these mills are building a type of house never before built in mill villages in the South, even during the last big era of mill village building in the 1920s, when such finely landscaped villages as Cramerton, N. C., some of the West Point villages, the U. S. Rubber Co., villages, etc., were laid out and constructed.

One engineer whose firm has had a great deal to do with the construction of a number of mill villages in the South over the past 25 or 30 years says that the average cost per room for mill village houses built from 1900 on was from $350 to $500 a room.

To replace those houses today, no better and no worse, would cost from $1,350 to $1,500 per room, this engineer says.

The houses being constructed in South Carolina by the Springs and Self organizations are of even better quality, of either brick veneer or asbestos siding, of five rooms with bath and garage.

The Springs organization is building about 300 of these houses at a cost of about $8,500 per house. If built individually, with the architect's fee and the contractor's profit included, they would cost over $11,000 each, according to Elliott Springs. They will rent for 75 cents a room a week, with 50 cents a week extra for both the bath and the garage, making $3.50 a week or $15 to $16 a month for a five-room house.

"Our housing has always been a considerable loss to the company and I would not be building these houses except that our employes are unable to rent a house within 10 miles of our plant, and cannot afford to build a house as good as these under present conditions," Mr. Springs says. The Springs organization has been expanding rapidly during the past two years, and has which require additional workers.

The houses being built by James C. Self, president of the Greenwood and Matthews cotton mills at Greenwood, S. C., are on a par with those being built by Mr. Springs. It is a personal hobby with Mr. Self to provide the best possible homes for his employes, his friends say.

Mr. Self told the writer recently that Greenwood Mills were building 80-odd new brick houses in their Matthews Mill village. He described these as structures with five large rooms, hardwood floors, tile bathrooms, tiled porch floors and tiled roofs. These houses will rent to Greenwood Mills' employes for $10 a month.

"Our entire village has paved streets and sidewalks, and low rates for electric current," Mr. Self explained. "In addition to this, we run a community laundry where we do the family wash without charge to the workers."

Borden Mills, of Kingsport, Tenn., is another Southern cotton mill organization which is expanding its mill village, having started last year to construct 100 new homes on a 20-acre tract near Kingsport to supplement the 300 houses in its original village. A separate non-profit corporation, the Liberty Rental Housing Corp., was formed to handle this proposition. It is headed by John C. Borden. The houses are of the pre-fabricated type and are placed on lots 50x150.

Bibb Manufacturing Co. is among the latest of the larger cotton mill organizations in the South to add to its existing villages, having constructed about 60 houses during the war at its tire cord plant at Columbus, Ga., and a smaller number more recently at its Porterdale (Ga.) village.

Bibb has about 1,400 houses in its three villages — at Macon, Columbus and Porterdale, and houses about 3,300 of its employes, or about a third. It has no intention of selling its villages, although its executives admit that it would be nice to be able to get their capital investment out of these houses and to be relieved of the responsibility which the villages entail.

Bibb houses some of its Negro employes at its Porterdale village.

Clinton Cotton Mills at Clinton, S. C., is another mill organization which constructed a number of houses during 1947.

J. P. Stevens & Co. also started the construction of about 50 houses at its Republic Cotton Mills, Great Falls, S. C., while the Santee Textile Mill, Bamberg, S. C., also erected about the same number of homes for its workers during 1947.

However, important and costly as are some of these projects, they are the exceptions which prove the rule, in the opinion of most well-informed observers of the Southern textile industry.

The era of mill village building in the South is over.

A few houses may be constructed here and there in the future, but it is hardly likely that the region will ever witness another such a wave of mill-village building as it last saw during the 1920's. Construction costs are too high to enable houses to be built to rent for 50 to 75 cents a room a week, even though they are much less pretentious than those being built by the Springs and Self organizations.

The only reason that most mills can afford to continue such rents in their present villages, where rents are not frozen, is because the villages in many cases are old enough so that the original cost of the houses has been fully depreciated, and because, being

costs.

RAYON INDUSTRY

While the mill village or other forms of company housing are by no means so definite a part of the policy of the rayon industry as they are in the Southern cotton textile industry, nevertheless many of the rayon companies with plants in the South have been drawn into such projects, to a greater or lesser degree.

du Pont, for instance, when it purchased the World War I smokeless powder plant at Old Hickory, Tenn., which later became its first rayon plant in the South, acquired a number of houses and dormitories which had been constructed to house the working force of this plant, about 12 miles from Nashville.

These houses, about 1,400 in number, have been retained by du Pont until now, and have, at various times, been remodeled and repaired. du Pont, however, has decided to rid itself of the incubus of this mill village and is now in the processs of selling the houses to its employes.

One of the few instances in which a rayon firm establishing a plant in the South deliberately created a mill village in the image of the cotton mill pattern was that of the Tubize Co., at Rome, Ga., in the late 1920's. When the Celanese Corp. of America acquired the Tubize organization in 1946, it inherited this village, which it still operates. It has not yet announced any plans for disposing of it.

Celanese has not constructed any villages at the plants which it has itself located in the South. The closest it has come to this is at its Celco (Va.) plant, where it has donated the land for a privately-financed housing project in the nearby city of Pearisburg, Va., and is presumably also interested in the company which is constructing these houses for sale.

Incidentally, the experience of the sponsors of this housing project duplicates that of most others which have endeavored to build houses in large numbers under conditions which have existed in the construction field for the past few years.

The first houses completed in the Pearisburg project sold at $5,500, it was learned. Those now being completed must sell for $8,500, although substitutions of less costly material have been made. Houses comparable to the first ones built would have to sell from $9,000 to $9,500 today, it is said.

Notwithstanding this fact, more than 100 houses have already been constructed and sold in this project and others are under construction.

During the war, Celanese also guaranteed the rents of all new houses constructed around its Celco plant as an incentive to builders to provide additional homes for its employees.

This is a common policy of large industrial firms locating new plants in isolated areas of the South. It was also adopted by du Pont to stimulate the construction of new housing in the neighborhood of its Martinsville (Va.) nylon plants.

Celanese has not yet announced its policy for stimulating housing in the neighborhood of its new Celriver plant at Rock Hill, S. C., but evidence recently submitted to Congress indicates that even before this plant has begun production, its construction has been the excuse for considerable increases in rents in Rock Hill and surrounding communities.

Rock Hill itself is about 10,000 population. It is a typical Southern textile community, having mills and finishing plants of the Stevens and Lowenstein chains as well as other textile plants and clothing factories.

RENT HIKES.

In testimony recently submitted to the Senate Banking and Currency Committee, John Edelman, Washington representative of the CIO Textile Workers Union of America, quoted Don McKee, TWU's field representative at Rock Hill, as citing an instance where the rent for two unfurnished rooms had jumped from $20 to $40 a month. Mr. Edelman said that, on a recent personal visit to Rock Hill, he found mill workers paying from $7 to $12 a week for house rent, with no utilities included. Rents, he said,

ing light and ice," Mr. Edelman told the committee. "This trend was noted just before the Emergency Price Control Act expired. We tried desperately to have controls extended to the area at that time. OPA had no funds to make the survey which was necessary to justify imposition of ceilings. Under the present act, of course, nothing could be done.

"Most of the houses I saw on which the rents had been raised were definitely substandard either lacking indoor plumbing and of flimsy construction or in poor repair. The absence of paint on these dwellings, both inside and out, is depressing.

"If there are screens on the houses, the tenants have to pay for these themselves. Most tenants buy their own stoves for heating and cooking."

Mr. Edelman later informed the writer that the houses he described at Rock Hill were commercially owned, not mill village homes.

The great influx of construction workers at Morristown, Tenn., as a result of the construction of the new American Enka plant nearby, has created a congested housing situation in the city also, although the mayor of the village told the writer he expects this situation to improve as soon as the construction crews leave town. In the construction of the new du Pont nylon plant near Chattanooga, Tenn., this situation has not become so aggravated, since local construction labor has been used to a greater degree.

At its original plant at Enka, N. C., near Asheville, the American Enka Corp. has a company-owned housing project, which dates from the establishment of the plant in 1928. This village contains approximately 150 houses, which are rented only to employees of the firm.

The key employes of the plant live in the village. Their cottages are more or less individual in design, ranging from small three- or four-room cottages to two-story dwellings. They are a mixture of wood, stone and stucco and are described by an Asheville newspaper man as well and attractively landscaped.

The rental is usually 10 per cent of wages or salary or a fixed maximum, whichever is lower. There are about 500 persons in the village, including the children.

While no mill village was planned in connection with the plants of the American Bemberg Corp. and the North American Rayon Corp. when they were built in 1926, the then German managers of the plants built a number of houses on a tract adjoining the

tion and progressive betterment of personnel practices and policies in the textile industry looking toward a sounder, more harmonious relationship between the people who manage and the people who perform the production jobs in the mills in the industry. The prognosis for better human relationships in the textile industry during the coming year and for a lessening of the management-labor wars is very good."

—Frank A. Costangy, Attorney and Industrial Counsellor.

one which is currently engaged in disposing of such housing.

The Old Hickory houses range from a small, one-story, 6-room bungalow (originally covered with prepared roofing but now sheathed with wood siding) to some large, two-story houses, rather imposing in a turn-of-the-century type of architecture.

The poorest type of house (which has no cellar and no central heating) has been rented to employes for $12 a month.

The best type (of which there are only a half-dozen, occupied by the executive of the plant) has rented for $100 a month.

OTHER HOUSES

In between these extremes are others, of varying sizes and construction, which have rented for $14, $16, $25, $30 and $50 a month, depending upon their size and their conveniences. Those renting for the higher figures have been remodeled, have half-basements and oil heat.

Du Pont executives have for some time been engaged in working out a plan for disposing of these houses to their employes, as a part of which the number of houses in the village may be reduced from 1,400 to about 900, in order to give the new owners larger lots.

Preliminary steps such as deeding the land occupied by the local churches to their congregations already have been taken by Du Pont, and plans made for disposing of the village electric plant to Nashville Electric Service, a TVA-affiliated municipal plant, which took over electric distribution in the village on Feb. 1, 1948.

While the Du Pont plans had not been completed at the time this article was written it was planned to offer the occupants of about 500 of the houses the home in which they lived at no charge,

A section of Norris, Tenn., the Federally-owned village which TVA has decided to sell during the current year. Here old-fashioned fireplaces share honors with modern electric heaters.

plants as a private investment. It was the alleged high rentals charged for these houses, from $35 to $40 a month, which was one of the employes' grievances in the 1929 strike at these plants.

The firms themselves were forced eventually to take over this housing, and they still own it. Judge Ben Allen, who, as a company vice-president is currently operating the plants for the Office of Alien Property Custodian, said recently that, while the rayon companies would like to be rid of the responsibility of this housing, that the present was not considered a good time to dispose of it.

Of the rayon firms in the South which have company-owned villages, therefore, Du Pont is the only

if they would remove it to a location of their own.

It was planned to offer the remainder of the houses to their occupants (or to other du Pont employes who have a village "seniority" if the occupants did not want to purchase them). The prices, while not specified, were expected to be "reasonable."

Tentative plans also called for some modernization of these homes to be required immediately of these purchasers.

To this end, the company planned to completely remodel one house as a sample, and to fix a scale of prices at which the various steps would be duplicated by the company for the new own-

Continued from Page Six

ers. Re-siding and re-painting the houses will probably be required immediately, but the other steps involved in complete modernization of the houses can be taken one by one, at a uniform price for each step, such as new bathroom fixtures, new sheetrock interior walls, etc.

Of the 4,400 Old Hickory employes (3,600 in the rayon division and 800 in the cellophane divisions) about 50 per cent have been housed in the company-owned village, which is about the average for cotton mills.

In addition, satellite villages (Rayon City and Du Pontania) have grown up near the Old Hickory plant under commercial auspices. A new development is under way at the first mentioned of these towns, sponsored by Nashville construction and real estate interests.

Du Pont, therefore, is following the regional pattern in disposing of its company-owned housing at Old Hickory. It owns no housing at its Richmond, Waynesboro and Martinsville (Va.) plants and is planning none at its new nylon plant at Chattanooga.

However, there is a considerable commercial housing development within a mile of the new Chattanooga plant, financed by local construction, banking and insurance interests in Chattanooga. Between 300 and 400 five- and six-room houses have already been erected, to sell for from $6,500 to $8,000, and many of these already have been sold, although probably not to du Pont employes, since construction of the plant has not been completed and the company is not yet hiring production employes. The total number of houses in this development is expected to reach 1,000 eventually.

A similar development, financed by local interests, is expected in the neighborhood of the new celanese plant at Rock Hill, although this has not yet been Federal Housing Administration mortgage. Of the first 17 to be sold, four were bought by Viscose employes. The same developer also has two additional 50-unit housing developments under way nearby, and has plans for the erection of 150 apartment units.

Still another developer is building 108 houses on a site adjoining that of the Old Dominion Housing Corp.

Some privately owned tenements are rented in Front Royal itself for as low as $10 to $15 a month, but they are described as neither modern nor desirable. However, the fact that rents for any sort of habitable shelter in the area have remained at such a level is due to the fact that it is still under rent control.

When rent control expired in the area last year the Textile Workers Union threatened to close the Front Royal plant unless it was restored. The ceilings were reimposed and are still in effect at this writing.

All through the South, there are a number of housing developments under way near cities or large industrial plants, mostly insured by the FHA, but the prices asked for these houses are such that it is doubtful that textile workers or rayon plant employes, at present scale of wages, can afford to purchase them.

Near Greenville, S. C., for instance, in a 100-home development 4 miles from the city (which eventually may number 300 or 400 homes), the price of a five-room house is $8,500, and that of a six-room house $9,500 to $10,000. However, as these houses are occupied by those who can afford to purchase them, other housing in the area will become available for purchase or rent, and, if this older housing is offered at reasonable prices, it may become another factor attracting cotton textile workers out of the mill villages.

This is the retail section of Kannapolis, N. C., headquarters of Cannon Mills. Largest unincorporated town in the United States, it is destined to become one of the finest retail shopping districts in the South as the result of Cannon Mills' program of building alterations and modernization.

OTHER HOUSING

Other owners of "company" housing in the South are the Federal Government and the coal companies. Both are endeavoring to get out from under.

The principal Federal project is the town of Norris, Tenn., of about 1,200 population, constructed by the Tennessee Valley Authority in 1934 to house the construction crew engaged in the building of Norris Dam. Present residents of the village, however, are mostly TVA employes, including Gordon R. Clapp, who succeeded David E. Lilienthal as chairman of the TVA board.

Norris currently comprises about 340 housing units including cottages, duplexes and apartment buildings. Two of the original dormitories are still operated for transients as well. In addition, there are about 150 undeveloped lots to which utility lines could be extended at a minimum expense and it is estimated that the population of the village could easily be tripled. Original cost of the housing units was from $2,000 to $8,000.

TVA has not yet announced its sales plan for Norris, so that it is not known whether an attempt will be made to sell the town as a unit, or whether the houses will be sold individually. The agency has appointed the head of its regional studies department, Howard K. Menhinick, to have charge of the sale, and, sometime this year, or next, the town will be put on the auction block under whatever plan the agency finally approves for its sale.

The Federal Government also has some remaining financial interest in such resettlement or subsistence homestead projects built under the Bankhead Act as those at Jasper, Ala., Crossville, Tenn., and Eleanor, W. Va., but most of the houses in these projects are presumably under purchase contracts which will eventually be paid out. The hosiery mills which were constructed in connection with them are now owned by Gotham Hosiery Co.

The coal operators also are trying to get rid of their company towns.

So far as is known, the only census of company-owned housing ever taken was that made by the Solid Fuels Administration for War in 1942. At that time coal operators owned a total of 131,592 houses, of which 80,000 were in the South. Since that time, many of these have been sold, principally to miners.

NO FIGURES

No figures are available for the South alone, but Charles O'Neill

> The next five or six years will see advancements in cotton production in the United States that will rival those of the past 150 years. By that time present day cotton gins and other equipment will seem as crude and out-of-date as Eli Whitney's first cotton gin does today.

required immediately, but the other steps involved in complete modernization of the houses can be taken one by one, at a uniform price for each step, such as new bathroom fixtures, new sheetrock interior walls, etc.

Of the 4,400 Old Hickory employes (3,600 in the rayon division and 800 in the cellophane divisions) about 50 per cent have been housed in the company-owned village, which is about the average for cotton mills.

In addition, satellite villages (Rayon City and Du Pontania) have grown up near the Old Hickory plant under commercial auspices. A new development is under way at the first mentioned of these towns, sponsored by Nashville construction and real estate interests.

Du Pont, therefore, is following the regional pattern in disposing of its company-owned housing at Old Hickory. It owns no housing at its Richmond, Waynesboro and Martinsville (Va.) plants and is planning none at its new nylon plant at Chattanooga.

However, there is a considerable commercial housing development within a mile of the new Chattanooga plant, financed by local construction, banking and insurance interests in Chattanooga. Between 300 and 400 five- and six-room houses have already been erected, to sell for from $6,500 to $8,000, and many of these already have been sold, although probably not to du Pont employes, since construction of the plant has not been completed and the company is not yet hiring production employes. The total number of houses in this development is expected to reach 1,000 eventually.

A similar development, financed by local interests, is expected in the neighborhood of the new celanese plant at Rock Hill, although this has not yet been started.

Waynesboro, Va., where du Pont's acetate plant is located, has jumped from 6,000 population in 1940 to more than 12,000 since the war, and illustrates some of the problems which such rapid growth can create.

There was a considerable housing shortage in Waynesboro during the war since, in addition to the du Pont plant, the principal employer of labor, and other textile plants such as Crompton-Shenandoah and Esmond Mills, there were several large war industries. New five-room houses of rather ordinary construction sold for as much as $9,330 (a popular price) and rents for five-room houses, when available, were as much as $60 a month.

Employment has continued high in Waynesboro notwithstanding that some of the war industries have reduced their forces by 75 per cent, but the overall reduction has been sufficient to ease the real estate situation somewhat, plus the fact that several hundred additional houses have been built in the past two years. The result has been that the same houses which formerly sold at $9,330 can now be bought for from $7,000 to $8,000 and rentals (when available) have dropped to about $50 for a five-room house. These rentals are still high in comparison with those in neighboring communities, however.

The houses were well constructed, of brick or of cement blocks, and there are cement walks, curbs, sewers, etc. The development in general makes a good appearance.

HOUSES SOLD

Most of the houses were originally sold to employes of the American Viscose Corp., as was the intention, and the first houses sold carried a restriction that they could not be resold within two years without offering them back to the Old Dominion Housing Corp. However, as the prices were raised, it became necessary to lift this restriction and, consequently, many of the original purchasers sold their houses at a profit of from $1,500 to $2,000.

At present, a number of commercial housing developments are in progress at Front Royal, since there is still a shortage of homes.

The Woodside Development Corp., a locally owned firm, is building 50 houses within sight of the American Viscose plant, which are for sale at $7,500 each, $600 down and $37.50 a month on a

employes. The same developer also has two additional 50-unit housing developments under way nearby, and has plans for the erection of 150 apartment units.

Still another developer is building 108 houses on a site adjoining that of the Old Dominion Housing Corp.

Some privately owned tenements are rented in Front Royal itself for as low as $10 to $15 a month, but they are described as neither modern nor desirable. However, the fact that rents for any sort of habitable shelter in the area have remained at such a level is due to the fact that it is still under rent control.

Present residents of the village, however, are mostly TVA employes, including Gordon R. Clapp, who succeeded David E. Lilienthal as chairman of the TVA board.

Norris currently comprises about 340 housing units including cottages, duplexes and apartment buildings. Two of the original dormitories are still operated for transients as well. In addition, there are about 150 undeveloped lots to which utility lines could be extended at a minimum expense and it is estimated that the population of the village could easily be tripled. Original cost of the housing units was from $2,000 to $8,000.

TVA has not yet announced its sales plan for Norris, so that it is not known whether an attempt will be made to sell the town as a unit, or whether the houses will be sold individually. The agency has appointed the head of its regional studies department, Howard K. Menhinick, to have charge of the sale, and, sometime this year, or next, the town will be put on the auction block under whatever plan the agency finally approves for its sale.

The Federal Government also has some remaining financial interest in such resettlement or subsistence homestead projects built under the Bankhead Act as those at Jasper, Ala., Crossville, Tenn., and Eleanor, W. Va., but most of the houses in these projects are presumably under purchase contracts which will eventually be paid out. The hosiery mills which were constructed in connection with them are now owned by Gotham Hosiery Co.

The coal operators also are trying to get rid of their company towns.

So far as is known, the only census of company-owned housing ever taken was that made by the Solid Fuels Administration for War in 1942. At that time coal operators owned a total of 131,592 houses, of which 80,000 were in the South. Since that time, many of these have been sold, principally to miners.

NO FIGURES

No figures are available for the South alone, but Charles O'Neill, president of the Central Pennsylvania Coal Producers' Association, said in a speech last month that, of the more than 14,000 company-owned houses in his district at the time of the SFAW survey in 1942, 8,308 had been purchased by miners, and, as soon as possible, all of the remainder would be sold. It is definitely the policy of the coal industry to get out of the housing business.

The industry is very sensitive about its company towns. A brochure entitled "Mining Towns," published in 1947 by the Bituminous Coal Institute, says that 65 per cent of all coal miners live in their own homes; that the average rent of a company-owned house is $11.50 a month or about 5 per cent of a miner's wages; and that, while a large percentage of mining houses in rural areas have only outside toilets, 35 per cent of all houses in the United States are still without such conveniences. Also, the average rural non-farm home rented for $27.88 a month in 1945 as compared with $11.50 for company-owned housing in coal mining towns, the bulletin asserts.

Some coal companies in the South are constructing new housing for their miners on acre plots rather than on small village lots, the BCI points out. It cites as an example the new houses of the DeBardeleben Coal Co., of Sipsey, Ala., illustrated in the accompanying photograph, which are rented by the company for $2 a room per month.

Admittedly, of course, these houses are much better than the average of company-owned houses in coal mining communities. But, in this industry, as well as in the cotton textile industry, the trend is to improve the standard of housing or to get out of the housing business.

The next five or six years will see advancements in cotton production in the United States that will rival those of the past 150 years. By that time present day cotton gins and other equipment will seem as crude and out-of-date as Eli Whitney's first cotton gin does today.

—Oscar Johnston,
National Cotton Council

MARKET FALL SEEN BRINGING NO MAIL HOUSE PRICE CUTS

Chicago, Feb. 13.—The consensus among the "big four" catalog-chains on the question of price adjustments on mail orders indicates a "wait and see" policy. None felt the persistent weakness in commodity and stock prices within the past week warrants any merchandise price changes at this point.

"We see no indication at present of any drastic price change in merchandise lines we distribute," a spokesman for Spiegel, Inc., said. "We are already operating at a lower markup than many distributors and our buyers are watching closely for any trends in wholesale markets that might mean further savings to our customers."

Alden's, Inc., is following a watchful waiting policy, a top executive said.

Although Sears, Roebuck & Co. and Montgomery Ward & Co. officials declined to comment, it is understood they too are proceeding on this wait-and-see basis.

Men in the trade point out fabrics, steel, lumber, and other materials used in general merchandise have not receded in price.

Small Percentage.

One of the leading executives in the mail order chain store field says only about 25 per cent of his firm's customers have been adversely affected by the inflation. This firm has spent almost 200 million dollars in expansion of its stores and mail order activities since the war.

A prominent mail order house official notes some months ago that they tried in early 1947 to withhold buying because they expected lower prices at wholesale, but found they were badly mistaken. Hence several in catalog circles feel it unlikely these big houses would try at this time to sell the merchandise market short by cutting their own prices while wholesale quotations continue firm.

Although the mail order houses are in the midst of mailing a total of probably 20 million catalogs, quoting prices effective till early July, they would not hesitate to relay lower wholesale prices to armchair shoppers the moment prices decline. That has been a traditional policy which actually was necessary if the catalog houses wanted to continue their competitive position with retailers who can put lower-price goods quickly on their shelves.

Fairchild Moving, Expanding Offices In Dallas Sunday

DALLAS, Feb. 13.—Because of growing importance of the Dallas market Fairchild Publications is enlarging its Dallas office and facilities. The office will be moved from 1114 Southland Life Building to 329 Fidelity Building effective Sunday. The new location will be headquarters for the Fairchild News Bureau, with Elizabeth Cleveland and Charmian Akins serving as correspondents.

Fred Rowe, advertising representative for WOMEN'S WEAR DAILY, Men's Wear and Retailing Home Furnishings in the Texas and Oklahoma area, will also office at the new address.

OLGA ADLER NAMED TO PRESIDENCY OF LEOPOLD ADLER CO.

By Staff Correspondent

Savannah, Ga., Feb. 13. — Miss Olga Adler, vice-president and daughter of the late store head, was elected president and treasurer of Leopold Adler Co. at the recent annual meeting. Elected to the board of directors were T. Mayhew Cunningham and Robert W. Groves. The latter is president of the Savannah Bank & Trust Co.

Miss Adler, who since 1942 has been closely associated with her late father in the operation of the business, first as a director and later as vice-president, has had wide experience in the merchandising field. Before joining Adler's, she was for several years with Kirby, Block & Co., New York, of which the Adler company is a member store. She also served as stylist.

It was made known that extensive improvements will be made at the store in the near future. Plans are still in the incomplete stage, however.

Seek to Break Deadlock At Windsor Print Works

North Adams, Mass., Feb. 12. — A Federal conciliator is seeking to break the deadlock in contract negotiations between the Textile Workers Union of America, CIO, and Windsor Print Works.

CANADA AUTO MFRS. TO CONSUME MORE DOMESTIC CLOTH

By FRANK FLAHERTY

OTTAWA, Feb. 13. — Canadian automobile manufacturers are buying more of their upholstery and other fabrics in Canada as a result of the import austerity program.

Announcement yesterday of the quota system applicable to the importation of parts and materials for automobiles disclosed a strong incentive for manufacturers to buy more in Canada. They will be allotted enough United States dollar exchange to equal 75 per cent of the average Canadian content of cars manufactured in the base period of 12 months ended Oct. 31, 1947. That works out to $230 for every car produced in the base period.

As some imports are essential, the more manufacturers can cut down on non-essential imports, the more of the essentials they will be able to bring in. Hence, the ability of manufacturers to equal or exceed output and sales in 1947 will depend on the extent to which they can get more materials in Canada. One company which previously imported textiles is reported to have found that, by giving all its business to a Canadian mill, it can get the material for 25 per cent less than it has been paying.

Others are shopping around for mills able to produce to their specifications.

Petition of ACW On Desmond's Denied

Washington. — The National Labor Relations Board has formally dismissed the petition of the Los Angeles Joint Board, Amalgamated Clothing Workers of America, for representation rights at Desmond's, Inc., Los Angeles.

The union lost an election there May 28, 1946, but later filed protests against the employer's conduct. The board overruled these.

Mount Royal Textiles

MONTREAL.—Mount Royal Textiles Corp., controlling British American Silk Mills, Ltd., declared a dividend of $1.66⅔ per share on the 5 per cent cumulative preferred, payable March 1 to stock of Feb. 20. This dividend is for a period of eight months at the rate of 5 per cent per annum.

desk copy

NATIONAL PUBLIC HOUSING CONFERENCE

PRESS RELEASE - MONDAY A.M. MARCH 1, 1948

RECEIVED

REPORT ON SLUM CLEARANCE
BY
SENATOR ROBERT F. WAGNER (D, N.Y.)
TO
THE JOINT COMMITTEE ON HOUSING

The need for housing for low-income families is urgent and aid from the Federal Government is essential to provide it, according to nine out of ten replies from governors, mayors, and prominent private citizens whose views are given in a report issued today by Senator Robert F. Wagner to the Joint Congressional Committee on Housing.

A similar overwhelming majority endorsed provisions for low-rent housing, slum clearance, and redevelopment of blighted areas such as are now contained in S. 866, the Taft-Ellender-Wagner Bill, which is awaiting action in the Senate.

The report of Senator Wagner, who was assigned to the study of slum clearance for the Joint Committee, is based on reports to him by 29 governors, 82 mayors representing 42 percent of the urban population, and 133 prominent individuals representing leaders in home building, real estate, and financing, other business men, labor leaders, local officials, and leaders in journalism, education, religion, and other public interest fields.

In his conclusions in the report, Senator Wagner, who introduced the original overall housing bill which was later succeeded by S. 866, said:

"I have become no less convinced of the necessity of this kind of approach as the housing problem has developed into a crisis. The problem is too vast to be solved overnight, but by taking constructive action this Congress can at least rekindle the hope of millions of Americans who are now forced to bring up their families under conditions which do not conform to the American concepts of family life. That hope lies in the enactment of S. 866, the Taft-Ellender-Wagner Bill."

Included in the findings of the report are the following:

Mayors from 78 cities, representing 41 percent of the urban population, estimated that 1,800,000 housing units in their cities are substandard.

Out of 230 replies from all sources, 206 state that private enterprise cannot in the foreseeable future provide either new or used housing of adequate quality to meet the needs of low-income families at the rents or costs they can afford to pay.

Out of 218 replies, 196 believe that public housing is necessary to meet the need. Of these, 189 favor continuation of the Federally-aided public housing program begun under the U. S. Housing Act.

Three-fourths of the governors and over 90 percent of the mayors say that the cities are unable to finance construction of low-rent housing, and an even larger percentage say they are unable to provide subsidies, other than tax exemption, to allow low-income families to afford such housing.

More than 90% of the mayors of cities where public housing under the U. S. Housing Act is in operation feel that it has served low-income needs, and all of those replying feel it has been built and operated efficiently. All but one of 43 mayors in these cities feel that low-rent public housing has never

-more-

competed with private enterprise, and 80 to 100% feel it has improved property values, reduced costs to the city, and improved delinquency and health conditions.

Out of 207 replies from all sources, 188 believe a program for redeveloping blighted areas is needed, and 180 of these feel public assistance is necessary to do this. Of those replying, about 70% feel that Federal aid provisions in the Taft-Ellender-Wagner Bill are adequate, with a majority of those dissenting feeling that these provisions are inadequate and a minority feeling they are too liberal.

Where some form of State redevelopment legislation now exists, only one of 10 governors and only 3 of 45 mayors feel such legislation is sufficient to do the whole job. None of the mayors and governors where no State legislation is available feel that the cities and states can meet the whole problem themselves.

The report quotes extensively from the replies. These are among the comments on the slum problem:

"The present deplorable housing situation is having a serious effect upon the family life....The City of Pittsburgh and every other city in our country are endangered by the growth of slums and the failure to provide decent homes for our citizens."---Mayor David Lawrence of Pittsburgh, Pa.

"The providing of low-rent housing is one of the most important problems facing the United States today and requires immediate and forceful action."---Governor Robert F. Bradford of Massachusetts.

"The need is great and people should not be compelled to live in conditions which prevail a day longer than is necessary."--Francis J. Murphy, publisher of The Hartford Times.

"Let's stop for once and for all this understandable discontent that leads to even a consideration of philosophies strange to American ideals."--Mayor Perrine Palmer, Jr., of Miami, Fla.

(Note to press: Detailed summaries on the various questions appear in the full report. The states and cities represented in the survey are listed on Page 30 of the report. Copies of individual replies can be seen in Senator Wagner's office, Room 226, Senate Office Bldg.)

16 - Housing

HOUSING
OF THE NONWHITE POPULATION
1940 to 1947

Housing and Home Finance Agency
Washington, D. C.
June 1948

UNITED STATES
GOVERNMENT PRINTING OFFICE
WASHINGTON : 1948

For sale by the Superintendent of Documents, U. S. Government Printing Office
Washington 25, D. C. - Price 15 cents

FOREWORD

The report on the housing of Negro veterans in 32 areas which was released by the Housing and Home Finance Agency in January 1948 pointed up the need for an analysis of the housing of the nonwhite population on a more comprehensive basis. Particularly among nonwhites, whose housing has long been considered so grossly deficient, it is important not to overlook the needs of those who are not entitled to the special preferences accorded to veterans. For this reason the data collected by the Census Bureau in 1947 have been studied closely, and the results of such intensive scrutiny presented in this bulletin. Although no conclusions have been reached as to the magnitude of the social need or market demand for housing on the part of the nonwhite population, the analysis contained herein should prove a stepping stone to the determination of the housing requirements of nonwhites, and to the means by which such requirements may be met.

The housing conditions of the nonwhite population have improved measurably since 1940, which is a tribute to the teamwork of the housing industry and Government—local, State, and Federal. However, we realize that our task is far from finished; in order to see how much we must do, we shall have to know where we stand now and how much we have accomplished in the seven turbulent years since 1940. Although this report does not attempt to set a course, I believe that it does give us our present bearings.

RAYMOND M. FOLEY,
Administrator,
Housing and Home Finance Agency.

ACKNOWLEDGMENTS

This analysis of the current housing situation of the nonwhite population is based on the findings of the Bureau of the Census resulting from the complete enumeration it conducted in 1940 and the sample survey made in April 1947. Although additional data are available for both 1940 and 1947, with reference to population and labor force particularly, only those data were selected for analysis in this report which had special bearing on housing. On the other hand, it was also necessary to go beyond the releases of the Census Bureau in order to answer some of the questions inevitably arising from examination of the published Census data alone. Thus, in attempting to understand the reasons for the improvement in the housing conditions of the nonwhite population, the Housing and Home Finance Agency requested and received from the Census Bureau supplemental information hitherto unpublished on changes in income during this period. This report was prepared by the Racial Relations Service and the Housing Data Staff in the Housing and Home Finance Agency.

HOUSING OF THE NONWHITE POPULATION 1940 TO 1947

SUMMARY

Significant changes have occurred in the population and in the housing inventory of the United States since the Census of 1940. The years between 1940 and 1947 cover a period of an expanding economy operating under many pressures. They include defense preparations, conversion to war production, active participation in the war, cutbacks and partial reconversion, and post VJ-day adjustments. As with workers in general, nonwhites moved in response to war demands and felt the full impact of this period. The necessary wartime limitations on new construction were such that the volume of new housing added to the supply for anyone was relatively small. To the extent that new housing was constructed, it was reserved for essential in-migrant workers in urgent war production areas. The delayed entry of nonwhites into war production employment restricted their eligibility for occupancy of these dwellings. Traditional neighborhood restrictions served to limit housing available to nonwhites during this period largely to more intensive use of the crowded areas already occupied by this group, supplemented by privately and publicly financed developments located generally in areas contiguous to such neighborhoods.

The nature and dimensions of changes during the 7-year period after April 1940 have been clarified by surveys of housing and population conducted by the Bureau of the Census in April 1947. These surveys also provided a basis for analyzing special impacts of World War II and its immediate aftermath upon the living accommodations of the nonwhite population, nearly all of which is Negro. They reveal:

Significant increases in urbanization and interregional shifts of the nonwhite population for the 7-year period ending April 1947 accentuated its housing difficulties.

About 2.7 million nonwhites migrated during 1940–47, with 1.2 million moving between noncontiguous States.

Of the total nonwhite population, the proportion living in nonfarm areas, rose

from 65 percent in 1940 to 77 percent in 1947.

The nonwhite population showed a decline of more than a million in rural areas, largely in the South, accompanied by substantial gains in urban centers of the Southern, North Central, Northeastern, and Western States.

The nonwhite population increased at a much faster rate than the number of dwelling units it occupied (11.6 against 6.9 percent) whereas the reverse was true for whites (7.5 against 12.5 percent). For nonfarm areas alone, the nonwhite population rose by a third, while the number of dwelling units it occupied increased by only a fourth.

The nonfarm dwelling units occupied by whites were, on the average, one room larger than those occupied by nonwhites, yet the average number of persons per dwelling unit occupied by whites and nonwhites was practically the same. At the same time, the proportion of nonfarm dwelling units occupied by nonwhites which were overcrowded (with more than one and a half persons per room) was roughly four times as high as that for whites.

The proportion of nonfarm dwelling units occupied by nonwhites which were substandard (needed major repairs or lacked essential plumbing facilities) was almost six times as high as that for whites, whereas the proportion in good structural condition with private bath and private flush toilet was twice as high for whites as for nonwhites.

The doubling of money earnings of nonwhite workers—indicated by rough comparison of Census data on yearly incomes for 1939, 1945, and 1946—was associated with, and presumably reflected in, the higher rates of improvement in housing supply as well as increase in home ownership among nonwhites than whites.

The proportionate improvement in the nonfarm housing supply occupied by nonwhites was about three times as high as that for whites. The proportion of nonfarm units occupied by nonwhites which were in good structural condition with private bath and private flush toilet increased by 57 percent, and that for whites by 19 percent. Similarly, the proportionate increases of other designated facilities, such as electric lighting, central heating, etc., tended to be sharper for the more deficient nonfarm units occupied by nonwhites.

The 1930–40 trend was reversed by a general increase in home ownership: The proportion of nonfarm home owners among nonwhites rose by 40 percent, and among whites by 27 percent. Even so, some two-thirds of the nonwhite households in nonfarm areas were still occupying rental units, and almost 60 percent of them paid less than $20 per month.

The shift of monthly rent distribution to higher levels showed that one in every ten nonwhite households living in nonfarm rental units was paying $40 or more for monthly rent; and over a fifth paying $30 or more.

Evidence of the pressure on nonwhite households to acquire more and better housing thus emerges from the data on their excessive overcrowding, doubling, and occupancy of substandard dwelling units, as well as their improved economic status. If the measurable advances shown between 1940 and 1947 could be made in the face of the severe building material and labor shortages encountered in that period, much more significant improvement should be possible in the ensuing decade through a combination of private and public endeavor. As the data presented in this report indicate, this applies with particular emphasis to the housing of the nonwhite population whose considerable economic advances during World War II appear to have continued substantially into the postwar period.

FIGURE 1

1/ Overcrowding as shown herein reflects the proportion of occupied units which contain more than 1.5 persons per room.

2/ Doubling refers to the percentage of households in which there is a married couple in addition to the head.

3/ Substandard housing reflects the proportion of occupied dwelling units which are in need of major repairs or lack private bath and flush toilet.

4/ The figures relating to home ownership and tenancy refer to the proportions of each which obtain for white and nonwhite occupants separately.

POPULATION CHANGES

Growth and Movement

Between 1940 and 1947 the nonwhite population[1] increased significantly. It rose from 13,454,405 to 15,017,000, or about 12 percent; considerably more than the 8-percent increase of the white population.

Sharp as this growth in population appears, it does not reflect the full pressure which developed on the housing supply. The shifts which occurred in the relative concentration of the nonwhite population from farm to urban areas and from the South to other parts of the country are far more important causes of pressure on housing than the mere increase in size of the nonwhite population. Nonwhites left farms, especially those in the South, in large numbers and for the most part settled not in rural nonfarm but in urban areas. The nonwhite population in rural farm areas declined by more than a fourth, from 4,750,000 to 3,480,000. In rural nonfarm areas it increased by 12 percent, which was modest as compared with the 40-percent increase in urban areas. In nonfarm areas as a whole (including both urban and rural nonfarm areas) the proportion of the total nonwhite population rose from 65 percent in 1940 to 77 percent in 1947. Among whites, the corresponding proportions were 78 and 81 percent.

A factor closely associated with the heightened urbanization of nonwhites has been the regional shifts revealed by the 1947 survey.[2] Census reports indicate that 2,729,000 nonwhites migrated during 1940–47; with 1,187,000 between noncontiguous States; 578,000 between contiguous States; and 964,000 within a State. Meanwhile, the nonwhite urban population of the United States increased by about 2.5 million. Conversely, the nonwhite population living in rural areas mainly in the South declined by about a million. The decline of 1,100,000 in the nonwhite rural population of the South, however, was accompanied by an increase of about 600,000 in the nonwhite population of southern urban centers. Of the total nonwhite population, the proportion residing in the South declined from about 75 percent in 1940 to about 63 percent in 1947. Correspondingly, among the urban nonwhite population, the percentage living in the South declined from 56 to 47.

Concurrent with these declines in the South, the proportion of the nonwhite population in the Northeastern States rose from 10.5 to 15.6 percent; in the North Central States from 11.2 to 15 percent; and in the Western States from 3.9 to 5.9 percent. The magnitude of these increases was close to a million in each of the first two regions and some 360,000 in the West.

The urban increases in the Northeastern and North Central States, in which nonwhites are principally city dwellers, corresponded closely to the increases shown for total nonwhite population in these regions. In the West, the relatively small increase in the nonwhite urban population tends to mask the impact on housing exerted by the very high proportionate increases which occurred in the nonwhite population, especially Negroes, in localities where heavy war production took place, such as Los Angeles, the San Francisco Bay Area, San Diego, Portland-Vancouver Area, and Seattle.

Comparative Changes in Population and Households

Probably as a reflection of the added difficulties encountered by nonwhites in obtaining adequate housing accommodations, the rate of increase in the number of dwelling units occupied by nonwhites was less than the rate of increase in the nonwhite population. While the nonwhite population rose by 12 percent, the number of nonwhite households[3] increased only 7 percent. In urban and in nonfarm areas the rate of increase in population was about one-third greater than the increase in households. Another facet of this is seen in the increase in nonwhite population per occupied dwelling unit from 3.6 to 4.0 between 1940 and 1947.

This runs counter to the long-term trends evidenced for the total population since 1890. In every decade from 1890 to 1940 and also from 1940 to 1947 the rate of increase was greater for occupied dwelling units than for population. For the period since 1920 when nonfarm data first became available this tendency has been even more pronounced for the nonfarm population. For example, from 1930 to 1940 nonfarm population increased by 9.5 percent, while occupied

[1] The population data shown herein refer to civilian population and include some persons who were not members of private households. Negroes constitute the bulk of the nonwhite population.

[2] A detailed report on migration was released by the Bureau of the Census as this study was in the process of being published. See Bureau of the Census, "Internal Migration in the United States: April 1940 to April 1947," Series P-20, No. 14, April 15, 1948.

[3] The number of households is equivalent to the number of occupied dwelling units.

dwelling units increased by over 19 percent. Similarly, from 1940 to 1947, the number of occupied dwelling units in nonfarm areas increased by about 17 percent compared to a rise of 13 percent in the nonfarm population. This is accounted for by the declining population per occupied unit. However, for nonwhites, as was indicated above, the population per occupied unit increased from 1940 to 1947.

Geographic Shifts in Households

Although the rates of increase in nonwhite households and population differed, to some extent the location of households followed the pattern of change observed for population. By 1947, two-thirds of the nonwhite households were urban, compared to little more than a half in 1940. Correspondingly, the rural farm proportion declined from 30 percent of all nonwhite households in 1940 to 20 percent in 1947.

The shifts that have occurred in the nonwhite households have thus brought about a distribution between farm and nonfarm areas which approximates more closely the distribution among white households. In 1947, the only significant difference between the location of white and nonwhite households was found in the rural nonfarm area where only 17 percent of the nonwhite households were living, compared to about 22 percent of the white households. The rural nonfarm areas to a large extent have been developed in comparatively recent years and contain a considerable number of subdivisions from which nonwhite occupants were excluded by means of racial restrictive covenants and other devices. The marked tendency shown by nonwhites to move to urban rather than rural nonfarm areas has undoubtedly aggravated the congested conditions under which many of them were living before this influx began.

Of the total nonwhite households in both rural and urban areas, the proportion found in the South dropped from 73 percent in 1940 to 64 percent in 1947. If only urban areas are considered, however, the proportion of nonwhite households located in the South declined relatively less, from 57 to 50 percent. This reflects the shift already cited of nonwhites from rural to urban areas within the South. The decrease in percentage of nonwhite urban households in the South was accompanied by gains mainly in the Northeastern States.[4] The proportion of all urban nonwhite households located in this region rose from 19 percent in 1940 to 24 percent in 1947. The detail for all regions is shown in Table 1, Appendix.

HOUSING SUPPLY

The extensive and rapid population shifts which occurred during the 7-year period resulted in extreme pressure on the housing supply. This was aggravated by restrictions on building operations in effect during several of these years as well as by increased demand stemming from high levels of employment and income.

Doubling

Evidence of the inability of people to find housing accommodations is found in the data on doubling. Households which contain, in addition to the head, one or more married couples provide an important indication of the extent of doubling.

Altogether, including white and nonwhite occupants, there were about 2,114,000 nonfarm occupied dwelling units containing married couples in addition to the head in 1947.[5] This constituted 6.5 percent of all nonfarm occupied dwelling units and represents an increase over the corresponding figure for 1940. It is estimated that in 1940 there were about 1,300,000 nonfarm households which contained subfamilies,[6] or about 4.7 percent of the total. Although no data are available to show how many of these households were nonwhite, a rough approximation prepared by the Housing and Home Finance Agency indicates that there were probably in the neighborhood of 180,000 nonwhite households containing subfamilies in 1940. This represented about 8 percent of all nonwhite households in nonfarm areas. In 1947 the corresponding proportion was about 10 percent, or about 280,000 households. Although it appears that there was an increase in the number and proportion of nonwhite households containing married couples in addition to the head, the degree of

[4] The states included are New York, New Jersey, Pennsylvania, Connecticut, Massachusetts, Rhode Island, New Hampshire, Vermont, and Maine.

[5] The total number of married couples in addition to the head in nonfarm areas was about 2,300,000. Although data are not available to show the number of nonwhite married couples living doubled up, there is reason to believe that the incidence of doubling is considerably greater among nonwhites than whites.

[6] A subfamily as defined in 1940 by the Bureau of the Census consisted of a married couple sharing the living quarters of heads of private households, regardless of relation to the head of the household. This concept is directly comparable with the 1947 data on the number of households containing married couples in addition to the head.

sampling variance and estimating error present in the data make precise calculation of the net change between 1940 and 1947 extremely tenuous. Despite the difficulty of making a comparison for nonwhites between 1940 and 1947, it is clear that the doubling rate is higher than might be expected under general economic conditions as favorable as those obtaining in 1947.

Overcrowding

The high proportion of doubling is undoubtedly a factor contributing to the overcrowding which is so marked in dwelling units occupied by nonwhite households. Overcrowding as evidenced by occupied dwelling units with more than 1.5 persons per room is far more prevalent among nonwhite than white households. Among nonfarm dwelling units occupied by nonwhites in 1947, about 15 percent were found to have more than one and a half persons per room compared to only 4 percent of such units occupied by whites. Little change was evidenced since 1940 in overcrowding in dwellings occupied by nonwhites when 18 percent contained more than 1.5 persons per room, although the proportion of overcrowding among whites declined by one-third. A shift of so small a magnitude in the figure for nonwhites may reflect sampling variability rather than a real change in conditions.

That nonwhites tended to be more constricted in their living quarters than whites is brought out in another way by examination of the distributions of the number of rooms per occupied dwelling unit and the number of persons per household. While about 35 percent of the units occupied by white households contained six or more rooms, only 17 percent of the units occupied by nonwhites were in this group. However, 12 percent of the nonwhite households consisted of seven or more persons as compared to only 5 percent of the white households. The median number of rooms in nonfarm dwelling units occupied was 4.9 for whites and 3.9 for nonwhites, or a room less, on the average, for nonwhites. At the same time, the median number of persons per nonfarm unit occupied was practically the same for both.

Income

Concurrent with population growth and shifts, the rise in the income of nonwhite workers had a marked effect upon the physical condition, tenure, and monthly rent[7] of the housing supply available to them. Census estimates of the income distribution of nonfarm families and individuals in 1946 show that approximately half of the nonwhite group had annual total money incomes over $1,600. For whites the halfway mark was about $2,700. The comparable medians for nonfarm families only (excluding individuals not in families) were somewhat higher, about $1,800 and $3,100, respectively, for nonwhites and whites. Approximately 20 percent of the nonwhite families received income of $3,000 and over.

Income data for prewar years are not available for a direct comparison with the distribution of nonfarm families and individuals by total money income received in 1946. Conversely, it is impossible to show 1946 income from wages and salaries which would afford a direct comparison with 1939 data collected by the Census Bureau. For 1945, however, information is available on civilian earnings, which differ from wages and salaries mainly in the inclusion of net income from self-employment.[8] A rough impression of income changes since 1939 may be gained by comparing the 1939 and 1945 data, bearing in mind the probable overstatement of the increase. Thus the median civilian money earnings of $815 reported for nonwhite civilian earners in 1945 was about double the median income of $371 shown for wage and salary workers without other income in 1939. Since the distributions and medians for total money income in 1945 and 1946 resemble each other closely, it is probable that civilian money earnings in 1946 were also substantially higher than in 1939, as evidenced by the most nearly comparable data for that year—income from wages and salaries.

This substantial improvement in incomes of nonwhites resulted from increased civilian employment, significant shifts from farm to factory, and considerable upgrading in type and level of jobs for both men and women. Added significance arises from the large proportion of nonwhite families which customarily have two

[7] Data are not available in the April 1947 survey for values of owner-occupied units.

[8] Differences in the income concept, in the size of the respective samples, in coverage and in sampling error prevent exact comparison of these data. In 1939, for example, only income from wages and salaries was reported and persons who derived income from sources other than wages and salaries are excluded from Table 6. But the 1945 figures include, in addition to wages and salaries, net income from farm and nonfarm self-employment (i. e., money income from a business or professional enterprise or farm in which the individual was engaged on his own account). Also, the 1939 data include earners in quasi-households such as hotels and quarters for resident employees of institutions, but the 1945 data exclude such persons.

or more regular wage earners. According to the Bureau of Labor Statistics, "reconversion of industry to peacetime activities brought no major downgrading in the occupational composition of the Negro workers. This is especially significant in view of the concentration of wartime employment advances of Negroes in those occupations, industries, and areas in which the postwar readjustment was most severe."[9]

Condition and Facilities of Housing

The rise in incomes between 1940 and 1947 was closely associated with the general improvement recorded in the condition and facilities of nonfarm dwelling units during this period.[10] Out of 32,354,000 occupied dwelling units in 1947, about 24,249,000, or 75 percent, were in good condition or in need of minor repairs only and contained private bath and private flush toilet. In 1940, little over 60 percent of all occupied dwelling units fell into this category. In contrast, the proportion of dwelling units occupied by nonwhites which were in good condition and had private bath and private flush toilet rose from about 25 percent in 1940 to 39 percent in 1947. However, twice this proportion, or about 78 percent, of nonfarm white households was living in such units at the time of the April 1947 survey; in 1940, the proportion was 66 percent.

There was a slight rise between 1940 and 1947 in the proportion of total nonfarm occupied dwelling units with electric lighting. However, this masks the sharper increase in the use of electric lighting which occurred in units occupied by nonwhite households during this period. While only about 60 percent of these units were equipped with such facilities in 1940, the proportion rose to 80 percent in 1947. Nevertheless, the 20 percent of the dwellings occupied by nonwhites which did not have electric lighting was about 10 times as large as that among white households.

The figures shown in the 1947 Census indicate a considerably higher proportion of nonfarm units occupied by nonwhites (about 72 percent) to be without central heating in contrast to the comparable proportion for white households (about 40 percent). To some extent, however, geographic factors probably account for the magnitudes involved. Because of the large number of nonwhite households located in the South and in rural areas, requirements for central heating equipment are fewer and the weight of such households contributes to the higher proportion of units without central heating occupied by nonwhites.

The proportion of units lacking one or more facilities (i. e., electric lighting and running water; flush toilet, bathtub or shower, and installed cooking facilities) was about three times as large among dwellings occupied by nonwhites as for whites (i. e., almost 60 and 20 percent, respectively).

Tenure

Other evidence of the impact of changes in the distribution of population and income upon the existing housing supply is shown in the changes which occurred in tenure during the 7-year period. The percentage of owner-occupied units in nonfarm areas rose from 41 percent in 1940 to 53 percent in 1947. Not only did nonwhites participate in the general increase in home ownership in nonfarm areas, but the proportion of owner-occupancy increased more sharply in this group than among whites. Thus, the increase for whites was about 27 percent and, among nonwhites, it rose about 40 percent.

In normal times home ownership is recognized as a desirable social goal. If it results, however, from the necessity of buying as the only means of obtaining a home, the effects of such forced purchases may be deleterious in the years to come. Many families, including nonwhites, were compelled to buy despite their preference to rent in order to have a place to live. Although some were well able to undertake the financial obligations of home ownership, there undoubtedly were marginal buyers for whom the risks of home ownership are great because of their more limited financial capacity. It is especially difficult for nonwhites to acquire living quarters during periods of general housing shortage because of prevailing restrictions upon their occupancy as well as their relatively lower incomes. Provided these workers are able to maintain and further their economic advances and have fuller access to an expanding housing supply, the trend toward increased home ownership among nonwhites will be more firmly established.

[9] *Monthly Labor Review*, December 1947, p. 665.

[10] Improvement in condition and facilities of housing observed in terms of Census data (i. e., state of repair and plumbing facilities) may be due in part to the effect of migration. However, data are not available to determine the extent to which the movement of nonwhites was from "poor" to "better" housing.

Significantly, in 1947, the proportion of nonwhite households occupying rented dwelling units was still high, i. e., approximately 66 percent compared to 46 percent among white households. (The detail is shown in the text table below.) This fact, taken together with their position in the income scale, makes it clear that the rental market is of major importance in housing nonwhites.

Tenure in nonfarm occupied dwelling units, by color of occupants: 1947 and 1940

Tenure	1947			1940		
	Total	White	Nonwhite	Total	White	Nonwhite
	(In thousands)					
Total	32,354	29,511	2,843	27,748	25,459	2,289
Owner-occupied	17,025	16,071	954	11,413	10,867	546
Tenant-occupied	15,329	13,440	1,889	16,335	14,592	1,743
	(Percent)					
Total	100.0	100.0	100.0	100.0	100.0	100.0
Owner-occupied	52.6	54.5	33.6	41.1	42.7	23.8
Tenant-occupied	47.4	45.5	66.4	58.9	57.3	76.2

Sources: U. S. Bureau of the Census, "Characteristics of Urban and Rural-Nonfarm Dwelling Units, by Color of Occupants: April 1947," Series P-70, No. 2, January 1948; 1940 Housing Census, Vol. II, "General Characteristics, Part I: United States Summary," Table 1, p. 7.

Monthly Rents

The rents paid by nonwhite tenants in 1947 tend to be lower than those paid by whites, although the rental distribution for both groups showed greater proportions in the higher brackets than in 1940. The median rents paid by nonwhites in 1947 were $17 compared to $31 for whites. In 1940, the corresponding medians were $11 and $23, respectively.[11] About 27 percent of all nonfarm tenant-occupied dwelling units in 1947 fell into the monthly rent class of $40 and over as compared to 15 percent in 1940. Accordingly, there was a decline in the proportion of renters who paid less than $20 a month, i. e., from 45 percent in 1940 to 27 percent in 1947. While almost half of the units occupied by nonwhite tenants in 1940 rented for less than $10 a month, by 1947 only a fourth were in this bracket. Despite this upward shift of monthly rents paid by nonwhite tenants, they are still concentrated in relatively high proportions in the lower rent classes. About 78 percent of them were living in units which rented for less than $30 a month, while less than half (47 percent) of the white tenant-occupied units were in the same rental range.

It should be borne in mind that despite these relatively low rents, about 185,000 households, or approximately 10 percent of the nonwhite tenants, were paying $40 per month and over. In addition, there are a number of nonwhite households able to pay and desirous of paying higher rents for better accommodations than those which they are now compelled to occupy.[12] This conclusion is reinforced by data obtained from the 1940 census which show that higher proportions of nonwhite than white families in the relatively high income and rent groups were occupying housing that was deficient in various respects.[13] Thus, although the majority of nonwhites require accommodations at very low rents, there is positive indication of the existence of a considerable rental market within the reach of privately financed housing.

[11] The changes in rent scales shown here reflect moves from cheaper units to more expensive units as well as rent increases, and should not be confused with the Bureau of Labor Statistics rent index which attempts to measure the changes in the rent of identical or closely similar units.

[1] Population per occupied dwelling unit overstates slightly the actual number of persons in the occupied dwelling unit because it includes some persons living in places not classified as dwelling units, but in large rooming houses, hotels, and institutions. However, this group is so small, relatively, that the trend of the figures from 1940 to 1947 is not significantly affected.

NOTE.—These figures are estimates derived from sample surveys and, therefore, are subject to sampling variation, which may be relatively large where the size of the percentage, or the size of the total on which the percentage is based, is small. In addition, as in all field surveys of income, the figures are subject to errors of reporting. For a more specific statement see "source and reliability of the estimates," page 5 of the source.

[1] The term "family," as used in this table, is not synonymous with "households" or "occupied dwelling units" referred to previously in this report. The term "families," as used above, refers to groups of two or more persons related by blood, marriage or adoption and residing in the same household or in the same living quarters of a quasi household. The term "individual" is used to refer to a person living alone or with persons not related to him.

[2] Median not shown where base is less than 100,000.

Median income for all units reporting (dollars)	2,410	2,573	1,314	2,595	2,690	1,613	2,603	2,741	1,562

NOTE.—These figures are estimates derived from sample surveys and, therefore, are subject to sampling variation, which may be relatively large where the size of the percentage, or the size of the total on which the percentage is based, is small. The figures for nonwhites, especially those for 1945 and 1944, are subject to large sampling variations. In addition, as in all field surveys of income, the figures are subject to errors of reporting.

[1] Includes families and individuals residing in quasi households (hotels, large rooming houses, etc.) as well as households. The 1944 and 1945 data are for families and individuals residing in households only.

Source: The 1944 data are unpublished estimates of the Bureau of the Census. The 1945 data represent material which is shown in greater detail in Bureau of the Census, "Family and Individual Money Income in the United States: 1945," Series P-60, No. 2, March 2, 1948.

TABLE 6.—*Comparison of wage or salary workers without other income by wage or salary income in 1939 with civilian earners by civilian money earnings in 1945, by color, for the United States*

Specified Type of Income Level	1939 [1]			1945 [2]		
	Wage or Salary Workers Without Other Income by Money Wage or Salary Level			Civilian Earners by Civilian Money Earnings Level		
	Total	White	Nonwhite	Total	White	Nonwhite
Percent [3]	100.0	100.0	100.0	100.0	100.0	100.0
Loss				0.6	0.6	0.9
$1 to $999	55.9	51.9	90.3	34.0	31.2	56.5
$1,000 to $1,999	33.1	35.9	8.9	27.1	27.1	28.0
$2,000 to $2,499	5.8	6.4	.6	12.6	13.0	9.0
$2,500 to $2,999	2.1	2.4	.1	9.1	9.9	3.0
$3,000 to $3,999	1.8	2.1	.1	10.3	11.3	2.2
$4,000 to $4,999	.5	.5		3.0	3.3	.2
$5,000 and over	.7	.7		3.3	3.6	.3
Median (dollars)	885	964	371	1,575	1,689	815

NOTE.—These figures are estimates derived from separate samples prepared in 1939 and 1945 by the Bureau of the Census. They are subject, therefore, to sampling variation which may be relatively large where the size of the percentage, or the size of the total on which the percentage is based, is small. For example, the figures for nonwhite workers in 1939 and nonwhite civilian earners in 1945 are subject to larger sampling variations than corresponding figures for whites. In addition, as in all field surveys of income, the data are subject to errors of reporting.

[1] Data for 1939 exclude persons who derived income of $50 or more from sources other than wages and salaries and secondary families and individuals in households, such as lodgers and servants; but they include earners in quasi households, such as hotels and quarters for resident employees of institutions.

[2] Data for 1945 include, in addition to wages and salaries, net income from farm and nonfarm self-employment (i. e., money income from a business or professional enterprise or farm in which the individual was engaged on his own account); but they exclude earners in quasi households (hotels, etc.).

[3] Figures do not add to totals because of rounding.

Source: Wage and salary income data for 1939 are from the U. S. Bureau of the Census, "The Labor Force (Sample Statistics), Wage or Salary Income in 1939." Civilian money earnings data for 1945 are derived from Bureau of the Census, "Family and Individual Income in the United States: 1945," Series P-60, No. 2, March 2, 1948.

TABLE 7.—*Condition and plumbing facilities of nonfarm occupied dwelling units, by color of occupants: 1947 and 1940*

80TH CONGRESS
2D SESSION

S. 866

[Report No. 140]

PART 2

IN THE SENATE OF THE UNITED STATES

MARCH 15, 1948

Referred to the Committee on Banking and Currency and ordered to be printed

APRIL 8 (legislative day, MARCH 29), 1948

Reported by Mr. FLANDERS, and ordered to be printed

COMMITTEE AMENDMENTS

Intended to be proposed by Mr. FLANDERS to the bill (S. 866) to establish a national housing objective and the policy to be followed in the attainment thereof, to facilitate sustained progress in the attainment of such objective and to provide for the coordinated execution of such policy through a National Housing Commission, and for other purposes, viz: As follows:

1. By striking out all after the enacting clause and inserting in lieu thereof the following:

"That this Act may be cited as the 'General Housing Act'.

"DECLARATION OF NATIONAL HOUSING POLICY

"SEC. 2. The Congress hereby declares that the general

16 - Housing

Housing for America

A Ten-Year Program

THE WELFARE of the people must take precedence over the interests of speculative builders and mortgage lenders. If a famine, a dearth of clothing or medicine—or a housing shortage—finds private enterprise unable to meet the people's needs, it is the duty of the government to intervene: to supplement the activities of private enterprise or, if necessary, to do the whole job itself. Only when business operations are again adequate, is it time for the government to withdraw. This is the theory that justified government intervention in the war-housing emergency. It is no less valid during a peace-time emergency.

A housing program for America should have the following goals:

Construction of 15,000,000 new urban and rural homes in the next ten years: government-subsidized housing for those unable to afford any other decent shelter; self-supporting housing for the middle-income groups. The T.-E.-W. bill is a step in that direction.

Clearance of all slums.

Prevention of future slums through practical building codes and standards, acceptance of which shall be the condition of federal housing assistance.

Replanned cities that will provide decent homes at reasonable cost in solvent neighborhoods, with the journey to work shortened, ample space for recreation, and adequate technical and social facilities to meet the needs of working mothers.

Communities where no discrimination based on race, religion, color, or creed is practiced or allowed.

A home for every veteran needing one.

Housing for the elderly as a right.

Continuance and strengthening of rent controls until the supply of houses has caught up with the demand.

Sounder private ownership through government insurance that will secure owners against the risk of default due to illness, unemployment, or other hazards.

A sound mortgage system, with loans by government agencies if private money is unavailable or private interest rates excessive.

A revitalized, stabilized building industry achieved through large-scale government-sponsored undertakings.

Rationing of critical materials to assure distribution according to need.

Prosecution of monopolies and outlawing of unfair practices that limit construction or rig the prices of materials.

Establishment of a new Cabinet post for Housing and Community Planning.

A SPECIAL SECTION OF THE NATION · MAY 15 · 1948

WHAT ARE OUR GOALS?

I. Cities Fit to Live In

BY LEWIS MUMFORD

WHAT kind of cities do we want? We Americans have never asked ourselves this question, during the last century, in terms of the needs of human living. We have asked for big cities, for skyscraper cities thronging with traffic and rife with trade, sometimes for monumental cities with great civic centers to express a dignity denied by every other activity. More lately we have asked for cities whose blighted areas and partly emptied slums have been converted back again into profitable investments or done over into hygienic "housing developments."

American cities, to a large degree, have been the products of the private land monopolist, the speculative builder, the too canny banker and insurance administrator, the centralizing business bureaucrat, bent on seizing and displaying power. With profit, prestige, and power the controlling influences in city development, more rational and humane ends have become secondary. Accordingly, if we dare to ask ourselves what kind of cities we want, we must be prepared to liquidate many of our present financial activities and to transform the remainder into social enterprises.

Is that too drastic a demand upon our social conscience, our political intelligence, our economic competence? Perhaps it is, but in that case there is no use asking what kind of cities we want. Whatever we may privately yearn for, we shall get the product of the same forces that have been operating in the past; and such modifications as public-housing authorities may make will be subservient to those forces. At best, they will do reasonably well what private enterprise has done badly, to the undermining of its own long-term interests.

Admittedly, the present is a bad time to frame more human demands, since while the housing shortage prevails people will put up with any kind of city so long as it incidentally puts a roof over their heads. That condition, however, is a temporary one. Our great metropolises are overcrowded, financially topheavy, environmentally lopsided; and the excessive costs of the congestion they promote are rivaled only by the costs of the remedies for alleviating it. Even our smaller cities, which have imitated the metropolitan pattern, likewise fall short of any adequate human goal. In the long run our civilization, just because it has already become predominantly urban, cannot afford to misdirect its energies in this fashion. It did not take the atomic bomb to prove that the present form of our cities is doomed. Though decentralization is no answer whatever to the practice of genocide, it is a first step toward building up a sound, life-centered civilization.

The tendency of population movements during the last century has been to heap people into spreading metropolitan districts, dominated by cities with over a million people; some quarter of the population of the entire country lives in such metropolitan areas—suburban in almost every sense. Do we want this movement to continue? If it does, it will produce two unfavorable results: it will wipe out the local balance between city and country and require those who seek recreation in rural areas to travel ever greater distances to have even a glimpse of nature. But even more fundamentally, if metropolitan standards prevail, it will bring about a premature stabilizing of the population, indeed, probably cause it to recede, since the big cities do not biologically reproduce their population and an ever smaller rural group remains to compensate for this lack of urban fertility. Theoretically, the great cities of the Eastern seaboard and the Great Lakes region might continue their growth until they merged into one another, as Minneapolis merges into Saint Paul, in one vast undifferentiated urban mass. But before that point was reached, the urban population would begin to dwindle, for with immigration restricted, its supply would be cut off at the source.

As between big cities and small cities, then, every biological argument backs the small city as more favorable, despite its lack of highly organized medical services, to life. The problem of population is too complicated to be disposed of in an aside; but if we wish to achieve even stability at present levels, we shall have to make it possible for more people to live in towns of fifty thousand or less, because they produce an environment and a routine of life more favorable to family life

LEWIS MUMFORD, author, philosopher, architect, and planner, has lectured at Dartmouth College, Harvard, Stanford University, and the Pacific School of Religion. A frequent contributor to the New Yorker *and other magazines, he has written many books, including "Sticks and Stones," "Technics and Civilization," "The Culture of Cities," "City Development," "The Condition of Man," and "Values for Survival."*

and reproduction. Does this mean that we must abandon the city altogether, as Frank Lloyd Wright has proposed? No, it means something quite different—namely, that we must drain away its population steadily into smaller centers until the metropolitan areas themselves can be reconstituted into a constellation of relatively self-contained communities, built on a more open pattern and separated from one another by parks and green belts.

London already has plans to remove a million people from its central areas into New Towns of some sixty thousand people each, not suburbs but complete and balanced communities, with factories and workshops for the local population. There can be no adequate rebuilding of our congested centers until the pressure that produces this congestion is thus removed. Hence housing and slum clearance, even if undertaken by public authorities, without industrial decentralization, are the most superficial of palliatives. But one must not minimize the cost of such a radical form of urban redevelopment. Since it involves cutting down present urban land values on a colossal scale, it will require heavy state and federal aid to make even the first steps possible: otherwise, merely to avoid bankruptcy, our municipalities—to say nothing of our banks and insurance companies—will fight it tooth and nail.

IN SHORT, we must plan and build new communities, on a large scale, before we can adequately replan and rebuild our old centers. Our present policy of replacing slum areas with grim monumental structures of the kind favored by the New York City Housing Authority changes the existing pattern of congestion but does not alter the fact itself, nor does it lower the land values which make congestion inevitable. A housing policy that purposes to rebuild American cities in this fashion is in the long run the most extravagant possible: it builds the wrong thing, in the wrong order, in the wrong place.

To achieve a better result, we must use governmental means to carry farther the tendency toward industrial decentralization which was fostered in many industries during the war. Regional planning, industrial decentralization, housing, and city development are four aspects of a single process which must be unified if it is to be effective. Administratively, this program cannot possibly be handled from Washington. If we wish to achieve it, our first step must be a political one: we must create regional authorities, on the model of the New York–New Jersey Port Authority or the Tennessee Valley Authority, capable of planning, building, developing, and holding these new communities till they are ready to take over the tasks of self-government. In an article as brief as this I cannot particularize all the political and economic measures that will be necessary: what I would emphasize is that the controlling factors in city building are no longer of a local nature; and that even the most farsighted municipality cannot by itself take the measures necessary to establish a better social structure.

The main point I would make is simple: there is no use asking ourselves what sort of city we want unless we are ready to deal energetically with the forces that have been automatically piling up congestion, disorder, and human depletion. Once this fact is realized, the next thing to understand is a fundamental theorem about city development first put forward by Ebenezer Howard exactly half a century ago. Howard pointed out that there were essentially two methods of city development: one is by continued agglomeration and extension, without any essential change in form; and the other is by reproduction. With the first method growth is unlimited and unbalanced. With the second method, which Howard reinvented, the city has a norm of growth: its area and population are limited. When the city reaches the limits of its growth, another community must be formed, on

"May be the people aren't ripe for it yet."

the same lines, to carry on the social and economic processes. Howard placed the optimum number of people for a relatively self-contained community at 32,000, some two thousand of whom were to be occupied by agricultural pursuits in the surrounding rural area. This was a reasonable guess; though by now, with the increase of facilities for transportation and communication, the upper limit is probably around sixty thousand. What is important to understand about Howard's conception of the garden city as he called it is not merely the limitation of area, or the collective ownership of the land, or density and numbers, but the even more essential principle of cellular growth and cellular division.

Ideally speaking, a city is a group of cells each of which has a social nucleus which furthers the common life, and the city as a whole is the larger organ of that common life. The principle of cell division applies to every part of a city's activities. If 100 beds is the right number for a well-organized general hospital, then when 500 beds are required, they should not be combined into a single gigantic institution but into five self-contained units distributed through the city or region. If 250 pupils is the desirable number for an elementary school, the neighborhood unit must be scaled and planned to that size. From the smallest housing group to the city as a whole, the aim is to create a balance of activities, in a varied and balanced environment. Instead of fostering growth by agglomeration, we must foster growth by reproduction.

The kind of city we want, accordingly, is one adequately planned and equipped for the fulfilment of life at every stage from cradle to grave. A city might be composed of houses and open spaces of the most excellent design, from one end to the other, without meeting this requirement. Consider the life of an ordinary city neighborhood today. We are happy when such a neighborhood has adequate playgrounds for the young: too easily we forgo the possibilities of swimming pools and gymnasiums, health clinics and maternity clinics, reading rooms and game rooms, where the members of the family would, even outside the home, find a common life. Despite the fact that an ever larger part of the community now lives beyond the age of sixty, what provisions have we made, in new housing communities, to enable the old to continue their normal social relationships? We either shift the aged into overgrown institutions, already cramped for space, or we condemn them to a state of dependency in the insufficiently roomy quarters of their own families. By building special quarters for old folks, scattered about a residential unit, we would give them the care, the stimulus, and the neighborly companionship they need.

None of the essential needs of a well-planned neighborhood, from nursery schools to special quarters for the aged, will be provided by private enterprise, seeking profit, except in the most limited and grudging manner. If we want better cities, we must look forward to the resolute extension of public enterprise, not as at present to rescue bankrupt investments but to rehabilitate a bankrupt life. Free enterprise in a democracy means, among other things, freedom to socialize.

Whatever changes toward more efficient administration take place in the political organization of the country at large, the most important task of all is to rebuild the essential unit of spontaneous cooperation and voluntary effort in the local community and, to begin with, in the neighborhood unit. We must rebuild and reequip the essential cell of community life. All large-scale planning will be inadequate until we have such units to work with. Once we have such units, we can build up balanced cities and draw them together in larger schemes of cooperation; so that eventually we shall have regional units capable of performing effectively all the functions that our metropolitan areas now perform at such a heavy cost.

What kind of cities do we want? Cities in which man

What T.-E.-W. Provides

THE Taft-Ellender-Wagner housing bill has as its purpose the encouragement of the construction of 12,500,000 to 15,000,000 new dwelling accommodations during the next ten years. In order to accomplish that goal, the bill expands credit facilities so as to encourage private enterprise to do the bulk of the job. More liberal guaranteed-loan terms on low-cost housing for rental purposes are provided, and the bill would guarantee a minimum of 2¾ per cent interest to investors who build housing units, on a large scale, for low rentals. It would extend through March, 1949, the government's authority to insure home loans for an additional sum of $1,600,000,000, thereby increasing the total to almost $7,000,000,000. The bill's most controversial title deals with the authorization of funds to eliminate slum areas and replace them with public-housing units for rental to families whose income is so low that private enterprise cannot and will not provide them with decent, sanitary homes.

The critics of this provision are merely trying to confuse our people as to the purpose and effect of the whole bill. Actually, public housing represents only about 8 per cent of the annual construction program. I know that it will be money well spent, an investment which will pay dividends in better health, better school attendance, and lower crime rates among families now living in slums. That statement is not a theory—it is a fact, proved by the public-housing program inaugurated under the Public Housing Act of 1937. The powerful real-estate lobbies opposed to the legislation scream loudly that the bill is socialistic, that it will ruin the construction industry. Those assertions are entirely without foundation. There is absolutely no competition between public housing and private enterprise. We have specifically provided that federal contributions cannot be made available until a community's elected officials certify that private enterprise cannot and will not meet that community's needs for decent housing for low-income groups.

I have been interested in housing legislation for a long time, and this bill is to a great extent the result of my own experience and observation. If it contained any provision threatening free enterprise or tending toward socialism, you may be sure that I would not be sponsoring it.

ALLEN J. ELLENDER, United States Senator

is at home again—at home in an orderly and comely environment cut to the human measure: cities where every function necessary to growth and development, biological and cultural, has an appropriate place in the plan and an appropriate structure. To bring such cities into existence, we cannot continue to follow the line of least resistance. Quite the contrary, we must alter our present life-denying goals and lay down the foundations for a new civilization—not a money economy but a life economy.

II. Freedom of Choice

BY CATHERINE BAUER

"HOUSING," says the recent report of the National Association of Housing Officials and the National Public Housing Conference, "is one of the great universal tests in this difficult and dangerous post-war world: a test of ideals, ideas, skills, resources; of our democratic capacity for change and growth; of the effectiveness of both private enterprise and government, and of their ability to cooperate; of the intelligence of consumer and voter as well as producer and administrator. If we in America with all our resources cannot even solve our own housing problem, what hope is there?"

It is in this sense that the housing situation should be a matter of prime concern not only to "housers" and the homeless but to all serious citizens. The construction and improvement of homes and communities is a major peace-time art; and since it requires, in our complicated modern world, the delicate adjustment of a great many factors, psychological and political as well as economic, it is an excellent gauge of the social aims and effectiveness of any society, of its ability to use its resources for the benefit of ordinary people.

During the disastrous boom and crash of the late twenties some valuable experiments with planned non-speculative private housing developments were undertaken. Low-rent housing and slum clearance were first begun on a national scale under the United States Housing Act of 1937. This framework stood us in good stead later, when we faced the need of providing emergency homes for migrant war workers. But now, in the worst housing crisis in our history, we have thrown away all our gains in knowledge and experience. The report of the N. A. H. O. and the N. P. H. C. says:

> As far as national policy is concerned, we have turned the clock back to the world of 1920. Of course, we do have rent control [pro tem at least]; interest rates are lower [though they're getting higher again]; and mortgage finance has been considerably reformed. And although house building is as exclusively the province of the speculative builder as it was then, the federal government has in the meantime taken over most of the risk for the builder's mistakes, through the Federal Housing Administration, the Home Loan Bank Board, and the Veterans' Administration. In other words, the government now guarantees much of the profit of private enterprise but assumes no parallel responsibility in the consumers' interest, no assurance of an adequate supply of new housing, no program to secure housing for the families who need it most desperately.

THREE GOALS

The result is that in our third post-war year we are no nearer to housing the homeless veterans than we were in 1945. And we are busily planting the seeds for still worse failures in the future. The N. A. H. O. and N. P. H. C. set three goals for an effective national housing policy. Let us see what the score is today on each.

Goal 1: "Enough homes—to overcome the present shortage, keep up with the increase in families, and replace the slums." We need 20,000,000 new dwellings by 1960, or 1,500,000 a year. Even if we produce at this rate, it will take at least three years to meet the purely quantitative contemporary shortage and another ten to replace the worst slums and provide for new families. But only "around 835,000 permanent homes were completed in 1947," and "this scarcely covers the net increase in families during the same period, let alone making up arrears." Thus we must just about double the current rate.

CATHERINE BAUER, a lecturer at Harvard and Cornell universities and former Rosenberg professor of housing at the University of California, is married to William Wilson Wurster, dean of the School of Architecture and Planning at Massachusetts Institute of Technology. She is vice-president of the National Public Housing Conference and was chairman of the joint committee of the N. P. H. C. and the National Organization of Housing Officials which drew up the report "A Housing Program—for Now and Later," quoted extensively in her article. The complete report may be obtained from the N. P. H. C., 1015 Fifteenth Street, N. W., Washington 5, D. C., for 25 cents. Miss Bauer is the author of "Modern Housing" and also a frequent contributor to magazines.

The fact that the shortage is not by any means wholly due to the war has been too little recognized. In the thirties even as in the forties the net increase in family groups was far greater than the number of homes provided. "By 1939 most large cities were acutely aware of a shortage, even though it was partly hidden by unemployment, which always causes considerable 'voluntary' doubling up." This long-term failure of the home-building industry suggests that the present deplorable situation may in fact be all too "normal."

Solely from the viewpoint of productive capacity, strong measures may be necessary if the shortage is to be met in three years: allocation of scarce materials, cutting down of non-essential construction, getting rid of restrictive practices all along the line, expansion in steel and other basic industries. But the first essential is "a firm bi-partisan Congressional determination to achieve a rate of 1,500,000 dwellings per year as quickly as possible, and *maintain* that rate for the next ten to fifteen years." Hit-or-miss measures will never do the job, simply because "most of the restrictive practices which have hamstrung the housing industry . . . reflect fears of over-expansion and underemployment, fears all too well grounded in the past."

Moreover, "the heroic effort required to solve the shortage by 1951 will . . . create the very instrument we need later on to replace slums and, incidentally, combat depression." For it will result in the "high-level stabilization" of residential building which is essential for productive efficiency and social well-being.

But homes will not be produced unless they can be distributed, which brings us to the second aim.

Goal 2: "New homes for all kinds of people—in all income groups, for rural as well as urban families." The great American fallacy has been the notion that any over-all housing progress could be achieved by building solely for the top of the market, letting the older dwellings "filter down" to families in the middle and lower income groups. On paper this can be made to sound like quite a logical theory, but in practice there is never enough decent, suitable, and well-maintained hand-me-down housing to take care of more than a fraction of the middle group, and almost none ever reaches the really low-income families. Instead, it is the very process by which we continually add to slums and blighted areas.

> In a shortage filtration either doesn't work at all or works in reverse. Even with rent control, the decent older dwellings are picked up at fancy prices and remodeled by the *higher*-income families. . . .
>
> When the shortage is finally met and we tackle our long-term replacement needs, the theory will work no better. Either families displaced by large-scale clearance operations will overcrowd other blighted or potentially blighted areas or new homes must be built for them directly.

What *is* the effective market in this country today?

> The residential building business as presently constituted can reach only the richest 30 to 35 per cent of American families even in a period of full employment and moderate costs, still fewer at today's inflated price levels. And it is now clear that there are no technological miracles of cost reduction just around the corner. . . . Enough housing to meet bare quantitative needs simply cannot be distributed solely to this small group, even were we to ignore the tragic immediate plight of average and lower-income veterans. And slum replacement and urban redevelopment are out of the question as long as this narrow and ineffective market for new housing is allowed to persist.

The principles of the N. A. H. O. and N. P. H. C. "were first developed in a depression, but in a period of shortage and inflation they are truer than ever. If new housing is to reach all income groups, the production of the speculative builder must be supplemented by non-speculative private housing in various forms and by public construction for the people who cannot get new homes any other way—which brings us right back to the provisions of the Taft-Ellender-Wagner bill." These provisions are dealt with in detail elsewhere in this issue of *The Nation,* as well as in the N. A. H. O.–N. P. H. C. report. But one point deserves special emphasis: the small low-rent public-housing program envisioned in the T-E.-W. bill should be expanded, and it must not be hamstrung by limiting amendments. All in all, the T.-E.-W. bill is the very least that can possibly be termed a "comprehensive housing program" today. It is the rock-bottom minimum that will get us started, at long last, toward achievement of a *universally effective housing market.*

But attacks on the problems of quantity and price, however bold, will not insure quality, which is our third basic aim.

Goal 3: "Good homes in good neighborhoods in pleasant and efficient communities." First of all:

> Standards must go up, not down. The standards set now by federal and local agencies are likely to determine the quality of America as a place to live in for the next generation. By 1960 about 40 per cent of the population may be occupying homes built *after* 1947. It is too easy, in a period of emergency, to slip backward. The standard of demand has been temporarily lowered: people will take almost anything . . . and there is all too great likelihood that much of what we build now will be obsolete and "undesirable" long before it is worn out or amortized.

Plenty of shoddy building, miserably planned, is going up today. And space standards are rapidly reverting to log-cabin scale. But our ideals and practice are probably farthest apart on the question of arranging homes—and people—in neighborhoods.

Variety is a basic principle of modern "neighborhood planning." Different types of homes should be included, "to provide adequate choice and to prevent over-standardization both in population and in general appearance," and schools, shops, playgrounds, and other community facilities should be built in at the start. In practice, however, we tend to operate very differently. A central site is usually covered solid with identical apartment buildings and little besides, even if the people to be housed there include many families with small children. And most of the progressively designed community schemes for outlying land have been stopped short by obsolete and rigid zoning ordinances that permit only detached houses, with few if any group facilities.

THE QUESTION OF SEGREGATION

Standardization of building types is matched by a strong trend toward complete social segregation, by class as well as by race, which is about as far from the ideals of democracy as anything could be.

> Zoning and large-scale housing operations tend to standardize wide areas within narrow income limits, while restrictive covenants and tenant-selection policy —with some notable and successful exceptions among forward-looking housing authorities—push us toward the most complete and absolute segregation by race. Housing and planning agencies have a major responsibility for effectuating progress, as rapidly as possible, toward the full integration of ethnic minority groups into our American democracy.
>
> The trend toward wholesale class segregation is no less marked. . . . But when we get a broad-based and efficient home-building mechanism, it should not be impossible to plan new developments to include different types of public and private housing. . . . In recent planning for central reconstruction part of the stated purpose is often to "bring back" some well-to-do families and restore a healthier civic balance. The reverse principle is equally necessary—inclusion of lower-income families in suburban plans. The greatest opposition will come from those upper-class communities whose primary preoccupation is protecting themselves against "invasion." Perhaps they should just be allowed to gently obsolesce in full possession of their prejudices, provided we don't create a lot of new ones.

Does all this sound sentimental and "utopian," even to a liberal audience? Let me state the alternative, implicit in present trends. Your children—and still more, your children's children—will grow up in a world in which generally they will see only one kind of person, their own kind. Anyone of different color or racial origin or economic status will seem queer and foreign to them, and probably dangerous. If this is the right training for citizenship in One World, or even in one nation or one city, then the principles on which this country was founded are indeed obsolete.

NEW HOMES ON NEW LAND—WHERE?

How are we going to fit all this new housing into the larger civic pattern?

> For the past five or ten years we have concentrated on how to get rid of slums and redevelop blighted areas. . . . The work will not be wasted, but the timing and emphasis turn out to have been sadly misplaced. The critical planning problem today is not slum replacement, which cannot be tackled on any scale until the shortage is met, but the location of housing in unbuilt areas.

Almost 5,000,000 dwellings must be built on vacant land in the next three years, more than double that number by 1960.

Drawing by Golden

> Ten million homes with their schools, shops, open space, and what not will probably take up more than three thousand square miles of space, an area equal to all the land within the boundaries of our forty largest cities, and half again as big as the entire state of Delaware. . . . This is our last great chance to do it right the *first* time, to prevent future blight and remedy some of the ills which already threaten to paralyze and bankrupt our communities . . . ills due primarily to chaotic expansion in the past.

If we follow the line of least resistance, and merely let the sprawl continue, every already insoluble urban problem will simply be redoubled—transportation, traffic congestion, blight, the relation between homes and work, the loss of open space for recreation, the multiplicity of weak local governments with tax rates mounting in direct proportion to their ineffectiveness.

Decentralization of both population and industry cannot be stopped, despite the King Canutes in the planning profession. This situation has been much more boldly faced by the conservative Tax Institute in its recent pamphlet, "The Disintegration of the American City," than by the general run of housers and planners.

What can we do? Real leadership on the question is coming mainly from Britain today. Its new Town and Country Planning Act and New Towns Act are as epoch-making as was its pioneer health and housing legislation a hundred years ago. The central areas of English and Scottish cities, whether blitzed or blighted, are being reconstructed at lower densities than formerly. And no more planless sprawling "ribbon development" is being permitted on the outskirts. New building will be channeled into complete communities, entirely new or expanded from existing small towns, far beyond the present urban fringe and including industry and adequate civic facilities for a cross-section population.

That we are pretty far behind goes without saying. The job of public education in England, although it has a long history, was mainly accomplished in the war years. In the next decade we in America can at least *begin* the task of reversing the current trend toward civic chaos—not by merely copying England, of course, but in terms of our own needs and desires.

"MINIMUM STANDARDS" ARE NOT ENOUGH

The principle of "minimum standards" for everyone, in what our housing act calls "decent, safe, and sanitary homes," is an essential concept for any modern nation, but it can have a rather bleak connotation. It suggests that the only alternative to chaotic slums may be standardized "projects," duly equipped with bathtubs and central heat but not very warming to the spirit. And it can give people the disquieting feeling that all social progress involves some sacrifice of individual liberty, some increase in regimentation.

Nothing could be more fallacious with respect to the possibilities and purposes of a defensible housing policy, whose primary aim should be to offer people a degree of choice they never had before. Indeed, as the housing organizations point out, "it is only because the choice of shelter available to people has become so limited and unsatisfactory by contrast with our resources that 'free enterprise' must be supplemented by public action."

We may have some choice in jobs at the present moment, but what kind of freedom does the home-seeker have? None at all in the current crisis, of course. Even when there are vacancies, low-income families can only choose between one slum and another. And "even if there were no shortage and you had plenty of money, you would probably have to choose between renting a noisy apartment in a crowded neighborhood, where your children must be muzzled, and buying a suburban house which is pleasant and open but isolated and an hour from your work, where you can't find a place to park anyway." Only when there are enough houses at proper prices, decently designed and sensibly located, will there be freedom of choice.

If "housing" in the past has often looked as dull as it sounds, the reasons are not far to seek. Standards and cost limits may have been set too low and administered too rigidly, or good architects may not have been given a chance. But this can be easily remedied if citizens and consumers will take an active continuing part in the formulation of housing policies.

WHAT DO PEOPLE WANT?

Some very large and basic questions of policy can never be decided until there is enough real variety in homes and neighborhoods, and enough experience in actual occupancy, to help us determine what people really want. Questionnaires are of little use; people who have never had any choice simply do not know how they would best like to live.

> For instance, a basic question . . . is whether the traditional American individual house-and-garden ideal is still as strong as ever or whether more of us will want a closer pattern of urban living, with maximum community services. Vast questions inviting all kinds of needed research are involved in this decision: Are women going to work or stay home? What will we want to do with our leisure time? Which kind of environment is more conductive to having children and raising them properly? Do people more and more want entirely different kinds of homes at different stages in their family cycle?
>
> The experts alone can never decide these matters. We shall not even begin to know the answers until a great many people have the actual power to choose between *good* examples of both kinds of housing. The choice between an expensive suburban house, twenty miles from work and with almost no neighborhood

facilities, and the usual sunless city apartment on a noisy street and almost equally lacking in group conveniences, is no choice at all.

Sometimes the experts sound as if they wanted to decide these things for us. There should be much more public debate than there has been among the proponents of Ebenezer Howard's Garden City idea, of the Le Corbusier skyscraper Utopia, and even of Frank Lloyd Wright's glorified subsistence-homestead scheme. Philosophical discussion is needed in this field, if only to make people aware of the implications of our routine decisions.

But . . . the positive form of our houses and cities evolves out of changes in popular ideals and living habits, varying from one community to another. And these can only be expressed in the long run through "natural selection," the individual's power to choose. The big job of the experts is to make a *real* choice possible.

III. Fifteen Million Homes

BY LEE F. JOHNSON

TO ASSURE every American family a decent home in a healthful community the best available estimates agree that we must build approximately 1,500,000 houses a year for at least ten years. There is only a relatively slight spread between one estimate and another. A 1945 report of a Senate subcommittee on a ten-year non-farm program proposed 1,200,000 units a year; the report of the Senate Banking and Currency Committee on the Wagner-Ellender-Taft bill (S. 1592), a ten-year program of 1,500,000 units a year, urban and rural; the report of the Senate Banking and Currency Committee on the Taft-Ellender-Wagner bill (S. 866), 1,500,000 units a year for a "sustained period"; the report of the Federal Reserve Board, 1,200,000 to 1,500,000 units a year, non-farm dwellings. The Twentieth Century Fund recommended a fifteen-year program for non-farm dwellings of 1,300,000 units a year; the joint committee of the National Association of Housing Officials and National Public Housing Conference, a twelve-year program for rural and non-farm dwellings of 1,168,000 units a year.

These figures were arrived at by experts with the help of statistics, charts, tables, and slide-rules. But the reasons why we need so many new houses can be discovered by any thoughtful observer: (1) The shortage is not of current origin; though it was aggravated by the war, it had reached alarming proportions before Pearl Harbor. (2) We have always underbuilt for all but the upper-income groups. (3) At least 2,000,000 families have been forced to double-up with others. (4) Millions are living in sub-standard housing. (5) The number of families has substantially increased. (6) A large number of dwellings are lost annually through condemnation, fire, storm and flood.

Drawing by Golden

If Congress would act now to carry out plans already drawn, a great stride would be taken toward our ten-year objective. Between 1932 and 1947 it has passed no fewer than sixty-eight bills of original or amendatory nature dealing in some fashion with the housing problem. In 1945 it considered a bill intended to produce housing over a ten-year period. Two and a half years and millions of words later practically the same measure is still pending. For all that the record shows, it is getting nowhere.

The Taft-Ellender-Wagner bill, now awaiting action by the House, would establish a national housing policy. It recognizes that every possible aid should be given to private enterprise and that public housing should be confined to dwellings for those income groups for which private enterprise cannot afford to build. Perhaps it is the very simplicity of this thesis that makes its acceptance difficult. In and out of Congress people are startled by the elementary proposition that it is physically possible, socially desirable, and economically feasible to take action which will enable Americans to live as Americans ought.

JOHNSON is executive vice-president of the National Public Housing Conference, an organization with headquarters in Washington that sponsors the public-housing movement in the United States and works for progressive public-housing legislation. Its seventeenth annual meeting was held in New York City several weeks ago.

WHAT IS BLOCKING US?

I. The Building Industry

BY ROBERT LASCH

THE last time I saw Karl, who is building a house for me, he had a triumphant smile on his face and good news to report. The I-beam had come. We had been waiting for the I-beam for six weeks. The lumber yard had ordered it from the distributor, who had ordered it from the steel mill, and now at last it had been delivered and Karl could go ahead with his work.

Drawing by William Steig for "Mr. Blandings Builds His Dream House" (Simon and Schuster)

With the I-beam in hand I tackled with renewed zeal the task of getting a bid out of Ed for the heating system. Ed was working twelve hours a day repairing oil burners. Every time he settled down to compute the figures for my job, an emergency call would come in from somebody whose furnace had broken down. Ed finally finished his computations, and we signed a contract.

This enabled me to start negotiations with Joe for the plumbing. While Joe was getting *his* figures together I rounded up several electricians to submit estimates on the wiring, and began to worry about finding a plasterer. About this time the distributor for my shingles called up to say they had arrived, and I had to make arrangements to have them trucked out to the site. Then I heard about a distant lumber dealer who was said to have interior doors at white-market prices. A trip out there confirmed the report. A few days later Karl called to say he had found a millwork manufacturer who would supply our window sashes and frames at a halfway reasonable price.

This sort of thing has been going on ever since I threw prudence to the winds and decided to build a house. When somebody mentions the building industry to me, therefore, my response is, "What building industry?"

Karl and Ed and Joe don't look like an industry to me. Each is a small entrepreneur, engaged in a continuous battle of wits with the unions, the lumber yards, the manufacturers of plumbing fixtures, the millwork people, the glaziers, and all the rest. Not one of them knows at the start of the building season how much work he is going to have. Not one has any reserves of capital. All operate catch-as-catch-can, with almost no planning, only the shoddiest sort of organization, and no sense of participation in an industrial effort.

Karl and Ed and Joe are not, in fact, producers of housing. They are carpenters, plumbers, sheet-metal workers, electricians, and cement men, whose work happens—sometimes—to result in the completion of a house. They may be in house-building today and out of it next year. One good season may graduate them to general contracting; a bad season may send them back to day labor.

If a housing industry really existed, I could visit an office on Main Street—just as I go to see the automobile dealer in his salesroom—and order a house. The house producer would send out truckloads of materials from his warehouse and a crew of workmen. The same crew would build the foundations, lay up the chimney, raise the frame, sheathe it and roof it, put in the wiring, instal the plumbing, instal the heating system, lay the floors, hang the doors, plaster, paint, and decorate—and then the boss would present a single bill.

ROBERT LASCH, chief editorial writer of the Chicago Sun-Times, *is the author of "For a Free Press," which won an* Atlantic Monthly *prize, and "Breaking the Building Blockade." He has been a Rhodes scholar and Nieman fellow.*

If a housing industry really existed, you could get a house by buying a certain number of standardized wall panels, roof panels, and floor panels, together with prefabricated utility units, and then hiring somebody to put them together. Or you could call on the local agent for a prefabrication firm and have him ship a standard ready-made house to your site. With few exceptions nothing like this is available to the man with an average income today. If you can afford it, you can turn your home-building headaches over to an architect and a general contractor and go away some place while the house is being built. But whether the contractor or the architect or the owner deals with the multifarious trades involved in building, the process remains the same.

BECAUSE the building industry is an unplanned amalgamation of many trades and tradesmen rather than an integrated business enterprise, its costs bear little relation to volume of production. Unit costs steadily rise in any period in which the "industry" is expanding to meet an increasing demand. Instead of bringing more and more people into the market as it expands, the building industry forces more and more people out. And eventually, when depression sets in, costs do not fall as fast as they rose. They come down only as prices in general come down. In short, it takes a depression to cut building costs. The same depression restricts the market for housing by lowering incomes. The supply never catches up with the demand until the demand no longer exists.

While building is subject to all the uncertainties of the free business cycle, it has become increasingly less free through the years. Each of its component trades has organized around a separate core. And each, in its particular self-interest, has contributed to the maddening network of combinations, restrictive practices, rackets, padded costs, and featherbed operations that strangles competition and inflates costs.

You can argue that the building trades are simply cutting their own throats. If they would jointly try to keep costs down, you can say, they might enlarge their market instead of reducing it. But the building industry is not impressed by this reasoning, chiefly because of its own fragmentation. With some justification each part can say that a few padded costs in its sphere will not greatly add to the total cost of the house. Furthermore, each department sees the others profiteering and quite understandably objects to being the sole martyr to self-restraint. When the carpenters see the contractors chalking up extra profits during a building boom, you cannot blame them too much for wanting to get theirs.

Basically, I suppose, the trouble is that none of the tough cookies in the building trades really believe the talk about eliminating depressions through planning. Knowing that business—construction particularly—has always fluctuated, they have little faith that the future can ever be different. Therefore they insist on making their profit during the up-period of the cycle, even if by doing so they insure the arrival of the down-period. This attitude, on examination, is not so very different from the attitude of business men generally. The dog-eat-dog scramble for profits is scarcely confined to the building trades. The result peculiar to the building industry, however, is a chronic inability to function fully or properly. The public needs a steady supply of new housing priced to suit various income levels, but the building industry usually produces housing only for the higher levels, and that only sporadically.

The cure for this tragic failure is to be found in planning. The first step must be national and local pressure for housing programs that will give the building industry assurance against a future depression. If the nation and the community made it perfectly clear that absorption of a certain volume of housing would be *guaranteed* for the next ten years, they would have the right to demand that the industry give up its antique ways, its monopolies, and its restrictive practices, and behave like a modern enterprise meeting modern needs. Private enterprise alone, obviously, will not create the incentives or insure the freedom necessary for the attainment of our social objectives in housing. If we are really in earnest about those objectives, we must adopt a national long-term housing program.

Teamwork in Congress

THE Senate once again rose to the level of statesmanship for which that body has often distinguished itself when it passed the Taft-Ellender-Wagner housing bill.

The bill as amended does not alter but strengthens the basic principles and provisions of the original bill and its predecessors, the first of which was introduced over two and one-half years ago. The bill provides the basic tools for the whole housing job: for doing it democratically, with equitable regard for the interest of all the people, in a way that places maximum reliances upon private enterprise, and without shirking the bedrock responsibility to provide for the people what they must have and cannot otherwise be provided. The general approach to the bill strikes the keynote for the spirit and method with which we must approach all our economic problems.

The success we have had thus far with the housing bill was brought about by good teamwork. The teamwork must continue in the House. I am confident that because its enactment stands as a challenge to do a big job in the American way the House will follow through and pass the bill in substantially its present form.

ROBERT F. WAGNER, United States Senator

II. Folklore and Taboos

BY JOHN P. DEAN

W. H. D. RIVERS called attention years ago to a Melanesian tribe among whom canoe building became so encumbered with taboos, social prohibitions, and personal penalties that soon no one wanted to practice it and no more canoes were built. Yet that society needed canoes. Substitute houses for canoes and present-day America for Melanesia, and you have our housing picture today. We haven't stopped building houses, but we are on the way. Meanwhile, those of us who most seriously need housing do without.

A rather intricate double-talk cloaks our ineffectiveness in attacking the problem. We engage in bitter controversy over proposals that really cannot solve anything; we give little attention to proposals that represent real progress, because we know their chance of legislative enactment is slim. The public is confused; even the experts frequently confuse one another. And through all this muddle we hold to our belief that somehow the "American way" can produce good low-priced houses for all.

In an effort to solve the housing problem without disturbing the status quo we make use of three devices: (1) we elaborate our housing myths; (2) we tinker hopefully with our aid-for-housing machinery; and (3) we pass new, complicated, experimental legislation.

OUR HOUSING MYTHS

Any realistic examination of the root of our trouble—the too high cost of good houses—is made nearly impossible by the shallow slogans which are repeated whenever the subject is discussed. Among the more widespread and pernicious are the following:

"Just give private enterprise a chance and it will do the job." But in no year since 1929 has private enterprise produced enough new houses to provide for the new families created in the same year.

"The shortage of homes is only a temporary emergency created by the war." Yet 4,500,000 homes are needed by the end of 1950 just to take care of new families and permit those now camping on their in-laws to "undouble." To build these, our rate of production must exceed by 50 per cent the rate in our most productive year to date—1925. Eight million additional homes will be needed to replace our worst slums and blighted areas. If 10,000,000 of the 12,500,000 homes we need are built on vacant land, they and the streets, schools, shops, and parks to serve them will require, as Miss Bauer points out on page 536, an area equal to the combined size of more than forty of our largest cities.

"Owning your own home is the American way." This ballyhoo is shouted constantly at the American public. The real-estate boys want everybody to believe that a house and land, in the long run, always increase in value and are therefore a good investment, that owning is cheaper than renting, that payments on a house are savings put away for a rainy day, that home ownership offers security for old age, that buying a home under a monthly-payment plan is "just like renting."

All these illusions have been exposed so often and so thoroughly that it would be tedious to do it again here. Let me just say that home ownership involves unforeseeable risks requiring great caution and expert knowledge. Every year hundreds of thousands of families disregard the risks and later regret it. Between 1926 and 1938 foreclosures came unpleasantly close to balancing the number of homes built. How many families, buying at today's inflated prices, are headed for disaster?

"Filtering down will take care of families that cannot afford new housing." In other words, even if the new homes built by private enterprise are so expensive that only one-third of our families can afford them, still, when those who *can* afford them move in, they will leave behind a number of vacant homes. Unable to compete at the highest level, these homes will drop in rent or sales price until families in the middle-income group can afford them. The homes left vacant by this group will in turn drop in rent, and so on until even the families that can pay no more than $30 a month will be able to move into decent homes.

Unfortunately, it just doesn't work that way. In the first place, we are unlikely to get the surplus required to set off the filtering-down process at any given level, since builders won't build in the face of a surplus. Even if private builders did overbuild for the upper-income groups, a tremendous number of second-hand houses would have to decline in rent to meet the needs of only those families in the middle-income group which now have no place to live. It is ridiculous to think that the number of middle-income homes would be increased to such an extent that the filtering-down process would enable our huge slum population to wind up with new homes. Even if we made this absurd assumption, we could still be quite sure that the houses would not be

JOHN P. DEAN is the author of "Home Ownership, Is It Sound?" and co-author of "A Book of Houses." He was formerly regional economist to the Federal Public Housing Authority.

adequate in condition or design or suitable in size or location for the families that would move into them, nor could they be kept in decent condition while renting for from $20 to $40 a month. A look at the record makes it clear that filtering down, where it *has* occurred, in bits and driblets, is merely the traditional method of providing low-income families with inferior housing.

TINKERING WITH THE MACHINERY

It will be quite impossible for us to solve the housing problem without substantially revamping our traditional housing practices. Unwilling to come to grips with this basic fact, we continually tinker with the financial apparatus of house-building in the hope that, once we get the wheels of production turning, the machinery will do more than spark, creak, grind forth a few houses, and then shudder to a standstill.

Speculative building operations were not very attractive under the Federal Housing Administration legislation, even though the government guaranteed FHA mortgages 100 per cent. But toward the end of the thirties Congress gave further assistance to the industry by permitting a smaller down payment and a longer amortization period for buyers of FHA houses. Home builders then began to vie with one another in more and more ambitious subdivisions. When the risks increased during the defense program, owing to rising costs and the reluctance of the FHA to underwrite inflated values, the builders pressed for ever greater protection. So Congress responded with the Title VI war-housing fund, which permitted the FHA to underwrite high war-time risks.

After the war the mortgage-lending fraternity and the home builders succeeded in having Title VI extended to include the Veterans' Emergency Housing Program. This cleared the track for some of the largest speculative subdivisions we have ever seen. The revolution had begun: the private-enterprise housing industry learned that under manipulated government protection it could become big business, but as someone has pointed out, it was scarcely "private" or "enterprise."

Manipulation of mortgage arrangements and liberalization of credit under the FHA and the G. I. Bill of Rights are supposed to invite families of smaller means into the home-purchasing arena—and sometimes they do. More often, the easier financing terms are reflected in higher selling prices. Even in ordinary times the home purchaser needs to keep all his wits about him to steer clear of a sour investment; today, in a seller's market of overpriced second-hand homes and the first high-priced samples of post-war housing, liberalized credit to the consumer is likely to be a temptation to disaster.

If we are going to widen the home-purchasing market by juggling the financing arrangements, then we should reduce the buyer's risks. There are three obvious ways of doing this: (1) Make the terms of purchase so easy that buying will truly be "just like paying rent." By eliminating down payments, reducing interest rates, allowing for flexibility in payments during times of financial distress, eliminating deficiency judgments, and making home transfer easy, we could make sure that in case of default, the buyer would lose nothing more than he was laying out every month. (The home buyer seldom understands that his mortgage obligation is a solemn debt that he must repay whether he stays in the house or not. If the return from a foreclosure sale or other sale does not cover the outstanding debt, the owner must make up the deficit. The court ruling that requires this payment is called a deficiency judgment.) (2) Develop some form of equity insurance. It would not take much revamping of the FHA formula to establish a system in which the equity that a purchaser built up by paying off his mortgage would be returned in case of default. As it is, we protect the lender rather than the home owner. (3) Improve the standards of house and neighborhood design. If easier terms were made dependent upon higher standards, the home owner, mortgage lender, and guaranteeing agency would all benefit and the risk would be shifted from the integrity of the home owner to the house—where it belongs. The mortgage machinery should be adjusted in favor of the consumer.

What about rental housing? Before the war 80 to 90 per cent of all new construction consisted of houses for sale. Builders had to be induced to produce rental housing by special FHA rental-housing provisions: the FHA lets a builder get his expenses out of a project before it is rented—and then hands him an equity he didn't pay for. The magic that produces this miracle is as follows: Although rents are permitted that insure only a 6½ per cent return, a 7 per cent allowance for vacancies boosts the builder's return for the first few years to 10 or 15

per cent. Allowances for management and operation under the FHA exceed the usual needs of building management. Generous reserve allowances permit the builder, who has invested no money in the project, to milk it by providing as little maintenance as he can get away with. Is it any wonder that stiff pressure is being brought on Congress to extend these benefits for ten years?

LEGISLATIVE PROPOSALS

If we reject the idea that our aid-for-housing institutions require a major overhaul, we have to call in the slide-rule wizards and ask them to conjure up new formulas that will preserve the status quo and achieve housing for families with modest incomes. The common denominator of the suggestions that have been made is a set of fictions that conceal from all but the sophisticated the nature of this sleight-of-hand.

Tax exemption is a popular feature of these proposals. It does not require appropriations, and huge hidden subsidies can sometimes be concealed in it. An equivalent cash subsidy would be "inexpedient politically," since the public would be quick to perceive what was going on. Uncontrolled tax exemption, as granted during the early 1920's, was an outrageous subsidy to speculative builders of shoddy housing. Nevertheless, it is being proposed today in slightly modified form.

Procedures that would favor special groups are included in many of the new schemes. The American Legion's Veteran Homestead bill, for example, would allow five or more veterans to organize an association to build, buy, or rent real estate. If the Veterans' Administration were lenient in administering the law, many veterans would incur losses; if the V. A. were tough, few houses would be built.

Befuddled by contradictions and complexities such as these, we have forgotten America's strength. Our productive capacity can achieve unbelievable goals when properly channeled. America can do pretty much what it wants to do, if it wants to badly enough. But unless we cut through our tangled system of aid for housing before the undergrowth gets any thicker, we may find housebuilding choked off.

CAN WE DO IT?

I. Yes, in an Integrated Economy

BY LEON H. KEYSERLING

IN HIS State-of-the-Union message and Economic Report in January President Truman set as the housing goal a decent home for every American family within ten years. In a special housing message in February the President made more detailed recommendations for attaining this goal.

President Roosevelt and many others had previously voiced the same general aspiration. Specific housing proposals almost as comprehensive as those advanced in February by President Truman had been urged upon Congress by the President on earlier occasions, and many of them were embodied in the Wagner-Ellender-Taft bill two years ago. The question is, then: Has anything significant recently emerged in the field of housing policy?

LEON H. KEYSERLING has been vice-chairman of the Council of Economic Advisers to the President since its creation under the Full Employment Act of 1946. Between 1937 and 1942 he became acting commissioner of the Federal Public Housing Authority and then general counsel to the National Housing Agency. He is the author of "Legal Problems in the Housing Field," "The Road to Freedom," and "Why the Wagner Act?"

The answer to this question is emphatically in the affirmative. The new element of vital significance is the recognition that our housing goal cannot be defined or achieved in splendid isolation. It must, instead, be placed firmly within the framework of a consistent program of goals for the whole economy.

This is the signal import of President Truman's messages. For the first time they place a ten-year goal for housing in the setting of ten-year goals for the growth and improvement of the whole economy, and outline the related policies for the attainment of these related goals.

We cannot decently house all Americans unless our economy expands at a rapid and steady rate through continuous full employment. The drop from more than 900,000 urban homes built in 1925 to less than 100,000 built in 1932 shows what happens to housing when our whole economy runs down-hill. We cannot sustain an average housing production over the next ten years more than twice as large as the record made in the best ten years before the war unless our total national output rises by 1958 to about twice as much as it was in 1938.

On the other hand, full employment and full production will not *of themselves* assure this high housing

achievement. We now have full employment and almost full production, but even if these were to be maintained indefinitely there would still be millions of lower-income families who could not afford decent housing under any foreseeable conditions of income distribution and housing techniques.

Thus there is need for *specific* housing measures even under conditions of continuous full employment. And without these specific housing measures to sustain a high level of mass demand for new residential construction, we cannot indefinitely sustain full employment, because residential construction looms so large in the total compound of national production. Housing, in short, affords the best illustration of the interrelationship between highly specialized programs and a general program for American prosperity. Responsive to these realities, the President's Economic Report of last January outlines some attainable objectives for the next decade. The report calls for a 35 per cent increase in total national output and a 27 per cent improvement in living standards after allowing for population growth and other factors. It goes on to cite some of the specific areas in which our efforts should be concentrated: plant expansion, resource development, diets, educational and health services, and housing. Finally, the report sets forth the economic policies, on the part of both private enterprise and government, for the attainment of these goals.

NOW what is new in this approach directed toward these economic goals? The trouble with a good deal of current economic thinking is that attention is concentrated almost entirely upon the detailed economic policies to be pursued—price policies, wage policies, profit policies, tax policies, etc. It is thought that these can achieve a condition of economic health. But just because the health that we are seeking consists of certain consumer-satisfaction goals, it is only by defining these goals first that the detailed economic policies can be wisely derived or applied. Economic policy being a means to human ends, we cannot evaluate the means without knowing where we want to go.

During the war we had specific ideas about production goals and the allocation of resources. We knew that about half of our national output had to be withdrawn from civilian use and applied to the prosecution of the war. We knew that we had to use certain materials to build planes, tanks, and guns, even if it meant—for example—deterioration of our railroad equipment. We knew that we could afford few gadgets, little joy-riding. And just because we had some clear idea of the end results needed, we could rally popular support for intelligent economic policies.

Today there are too many of us who have carried over from war-time experience a preoccupation with the mechanics of economic policy—such as the wage-price-profit relationship—while neglecting to lift our sights to the end purposes which must give these mechanics meaning. In peace as in war, though by different methods, the designation of at least a few major goals, housing among them, is the essential starting-point for worth-while national achievement.

President Truman's Economic Report, carrying out the sound requirements of the Employment Act of 1946, makes a sizable start toward developing these goals. It includes the goal of a decent home for every American family within ten years. More broadly, the report tests economic policy against "needed levels" of employment and production within the device of a "nation's economic budget." This is a convenient tool for applying, in the national economy, the adjustment of means to ends which govern the operations of a soundly run business or a well-managed family. It is within this long-term program for the economy as a whole that a long-term housing program finds its significant place.

So much for the *economic* value of goals. They are equally valuable from the viewpoint of the popular psychology. Whether the unfolding years will realize our incalculable capacity for progress or instead bring on another depression depends on our *affirmative* efforts. A program for such effort is not too hard to formulate; the trying task is to gain the general agreement which alone can put the program into effect in time. In 1933 that sufficiency of agreement resulted from four years of unparalleled economic suffering; in 1941 it resulted from foreign attack. Where is the propulsion to come from today; what moral equivalent have we for depression or war? We now face the infinitely difficult task of mobilizing public opinion when the bases for action are obscured by full employment and high prosperity.

We can and must rise to the challenge. We should

The Duty of the State

WE have long recognized the duty of the state to give relief and free medical care to those unable to pay for it, and I think shelter is just as important as relief and medical care. . . . I believe there should be a comprehensive [housing] plan with the ultimate purpose of securing decent housing for all American families, and I think the Taft-Ellender-Wagner bill is a step in that direction. As for a public-housing program, I would hope it might take care of the needs of 10 per cent of the people, namely, those of the steadily employed low-income group who have the lowest income. . . . If I were sure we could solve the housing problem in this country and keep it solved by expending $400,000,000 a year, I would favor doing it.

ROBERT A. TAFT, United States Senator
(New York *Post*, January 27)

popularize our national economic goals, realistically and effectively. Americans have a tremendous faith in what they can do. They want to combine social justice with economic progress. They can be excited by a program to stamp out poverty no less than by a war to stamp out fascism. They do not need to be "sold" a housing program on the ground that it will provide jobs and stave off unemployment. They can understand that slums are even more intolerable in a prosperous economy than in one which is depressed.

Our American tradition is to pyramid progress upon progress, never being satisfied that the best for today is good enough for tomorrow. These things the people feel. They need only the unifying goals to provide a basis for action.

This initial momentum can result from the Employment Act of 1946. Under its provisions the government needs to assert considerable leadership because it has the over-all perspective, but private and public groups are participant. This will require new combinations of federal, state, and local responsibility. Housing provides an unequaled opportunity for this composite action, since its primary goal is the welfare of all the people and its development in practice is enormously complicated. The magnitude and content of the program this calls for, and the methods by which we can make it succeed, are set forth in the other articles of this special issue of *The Nation*. My purpose here is to make clear the fact that the housing problem is part and parcel of the problem of our entire economy, and that without an inclusive approach there can be no solid solution.

Those dispirited or alienated liberals who find it easy to blame a few individuals for the present relative lack of forward drive—in housing and elsewhere—do not fully measure the tasks before us. No one man or group of men can alone provide the people with the moral equivalent for depression or war. Countless workers everywhere must assume the hard and often unglamorous task of popular education. If that job is not shirked, President Truman's goal of a decent home for every American family—and his other goals for national progress—will certainly be reached.

II. A Business Man's Prescription

BY NATHAN STRAUS

ALL the new housing built this year will be beyond the means of half of the population, whether it is housing for sale or housing for rent. If one disregards a little trickle of public housing built by local authorities during the Roosevelt Administration for the poorest third of the population, the same thing could have been said in any year of the past half-century, in good times or bad. This fact must be the starting-point of any useful discussion of housing.

Even the public-housing trickle has dried up; the Washington lobby of the slum landlords and the building and loan associations has seen to that. The cheapest two-bedroom house or flat now offered by the speculative builder is priced at $8,000 exclusive of the land, or it rents for $80 a month and up. To afford that, a family today should have an income of $4,000 a year. Only one family in four will earn that much this year.

NATHAN STRAUS is a business executive who believes good housing is good business. His radio station, WMCA, staged a successful campaign for the adoption of a program of self-supporting housing in New York City last January. From 1937 to 1942 he was administrator of the United States Housing Authority in charge of an $800,000,000 public-housing program. He has also been special housing commissioner for the City of New York. He is the author of "The Seven Myths of Housing."

What is the answer? Can homes be built that will be within the means of the families that need them most? I believe they can. And I will stake my reputation, based on years of successful experience in private and public housing, on the soundness of the following proposals.

Low-rent public housing should be erected by local housing authorities. It should be designed by private architects and built by private contractors employing labor at prevailing wages. This public housing should be of two kinds—subsidized and self-supporting. The subsidized housing would be for the lowest-income families. The annual subsidies required would range from $25 to $125 per family, and would come from state and federal funds. (The conspicuous success of the United States Housing Authority from 1938 to 1942 has set a pattern which it is safe to follow. Nearly 200,000 families were rehoused, every one of which came from a slum tenement or shack. Construction cost averaged about 25 per cent less than that of housing put up by private speculative builders during the same years in the same communities.)

The capital funds needed for a subsidized public-housing program can be obtained without difficulty from private sources. Experience proves this. Investors are ready to buy local housing-authority bonds in practically

unlimited amounts at an interest rate of approximately 2 per cent.

Subsidized public housing should, however, be only a minor part of the program. Self-supporting public housing should constitute the major part. Rents in self-supporting projects should be set at a level sufficient to meet all operating costs and financial charges. They would amount to about $50 a month for a four-room or two-bedroom apartment.

The cities in which these projects are built would collect taxes on the land utilized for them—but not on the buildings.

As in the case of subsidized housing the capital funds needed to finance the construction would be obtained from private investors. Two methods have been worked out for tapping this source. Both have been discussed in detail with banks, life-insurance companies, and the largest private-banking concerns in Wall Street. The legal details have been studied and approved by the legal counsel on whom these large financial institutions are accustomed to rely.

Bonds of the local housing authority would be sold to private investors in an amount equal to 100 per cent of the cost of the project. Security for these bonds would be the rentals themselves. But in order to insure the sale of the bonds at a low interest rate, additional security is required. This can be provided in one of two ways.

One method calls for a small annual city tax. For a housing project costing $10,000,000, the tax would have to provide only $100,000 a year. And it is probable that the tax would never have to be collected after the first year. Once raised, it would lie in the treasury of the housing authority as additional security or guaranty, to be drawn upon only if unforeseen circumstances interfered with the collection of rents. All experience with public housing in the last ten years indicates that the guaranty would never have to be used.

The alternative method of providing the necessary security is a federal guaranty: that is, the United States government would guarantee the bonds of the local authority. To build up a reserve fund on which the federal government might draw in case of default by a local authority, the authority would have to pay over a certain number of years an annual premium of one-eighth to one-quarter of 1 per cent of the total bond issue.

Bonds secured by a mortgage upon public-housing projects and further secured by either one of the methods proposed above could be sold at an interest rate not exceeding 2¾ per cent. Since the chief factor in the annual cost of housing is the cost of capital, this feature of the proposals is of the highest importance.

Such a program would provide good housing at low rents without imposing a great burden on the taxpayer. The arguments against it arise from honest ignorance or from deliberate misrepresentation. Many of the arguments advanced by the National Association of Real Estate Boards, the National Association of Home Builders, and the United States Savings and Loan League are based on misrepresentation. The heart of the opposition to public housing is formed by these powerful and immensely wealthy organizations.

Under their influence government policies today are aiding speculative builders of houses for sale. This is wrong, for there is no shortage of credit for that purpose. It is wrong because the government should not encourage families with small incomes, including veterans' families, to buy homes. Half the families in the United States, even in this period of high incomes, earn less than $2,700 a year. A house bought on the instalment plan by such a family often becomes an insatiable monster that swallows earnings and hopes alike. The buyer finds that he does not own the house but that the house owns him.

The federal government should stop aiding speculative builders to peddle houses on the instalment plan and should start aiding communities to build large-scale rental-housing projects.

The A. F. of L.'s Position

IF THE housing shortage, now in its most acute stage, is to be met fully and effectively, the two most essential steps are, first, the enactment of the T.-E.-W. bill, already approved by the Senate and now pending before the House, including its public-housing title, and, second, stabilization of building-material and real-estate prices. Local planning for redevelopment of cities, towns, and rural areas, construction of low-rent homes by local authorities, and slum clearance must be made a part of a long-range program for the whole nation, with provision for the necessary federal aid. Equally important is the assurance of extended economic stability, without which millions of low-income families will continue to be deprived of decent homes. Firm standards must be established for private-home construction, putting an end to widespread jerry-building. An eighteen-month guaranty against structural defects should go with the purchase of every new home. A lapsed-payment plan, extending the payments up to two years in the event of unemployment or other acute economic distress, should protect home buyers against eviction when they are least equipped to meet the emergency. Payment of not less than prevailing wages on all home construction should be required by federal law. A large amount of rental housing for families of low and moderate incomes should spearhead the long overdue attack on America's most vital domestic front. Labor's objective on the housing front is the assurance of a decent home for every American family.

WILLIAM GREEN, President, A. F. of L.

THE POLITICS OF HOUSING

I. Veterans Want Action

BY CHAT PATTERSON

NEARLY two thousand veterans from thirty-nine states, representing seven major veterans' organizations, gathered in Washington last March to tell their representatives in Congress that they wanted long-range housing legislation—and pronto. For three years the returned soldiers had been demanding that Congress take action to solve the housing crisis, and for the same period the powerful real-estate lobby had been fighting against any effective program. The first round had been won by the real-estate lobby: with an assist from President Truman the lobby killed the Wyatt Emergency Housing Program just as it was beginning to show results. The Washington congress was an expression of the veterans' determination that the second round should not be lost—that the Taft-Ellender-Wagner bill should be passed.

When the war ended, the nation faced the greatest housing shortage in history. And the returning ex-service men found that as a group they were hit the hardest by it. The Bureau of Census last year published a report which showed that from 30 to 40 per cent of married veterans were living in rented rooms or doubled up with in-laws. In Los Angeles County, California, 50 per cent of the married veterans were without acceptable living quarters; in New York City, 44 per cent. The report also showed that veterans could not afford to buy or rent the housing now being produced. With an average weekly income of $40 to $50 veterans cannot pay more than $50 a month rent or buy a house costing more than $7,000.

Recognizing the ex-soldiers' housing plight, Congress passed the Veterans' Emergency Housing Act and named Wilson Wyatt as administrator. By the use of priorities and controls on materials prices Wyatt attempted to get houses built at costs within the veterans' means. After the 1946 elections, however, the Wyatt program was abandoned, and everybody waited to see if the real-estate lobby would carry out its promise that once controls were removed, abundant low-cost housing would be forthcoming. We all know the result. Housing is being produced—but at prices half again as high as under the Wyatt program, prices which effectively exclude the majority of veterans from buying homes.

Today housing is as scarce in most parts of the country as in 1945. The goal of the veterans' program was to build 2,700,000 units in two years, including new permanent housing, conversions, temporary housing, trailers, and 800,000 prefabricated units. Actually 1,900,000 units have been built—1,500,000 of them permanent construction. The prefabrication scheme has been a complete failure. This is something Congress should investigate, for next to the T.-E.-W. bill, industrialized housing offers the best hope of bringing down costs.

One reason for the failure of the housing prefabricators is found in the antiquated municipal building codes. These codes force up the cost of homes and make erection of industrialized housing virtually impossible. The housing-research section of the T.-E.-W. bill is expected to bring real progress in gearing housing production to our industrial system, but the progress will be stymied unless the building codes are revised.

Only the A. V. C. among veterans' organizations rallied to the defense of the Wyatt program. In the old-line veterans' groups the intrenched World War I leadership chose to take their cue from the lobbies rather than heed the pleas of the new veterans. The issue was brought to a head when World War II veterans in the American Legion and the Veterans of Foreign Wars began calling for indorsement of the Taft-Ellender-Wagner bill. In the V. F. W. the bill's supporters finally won a victory in the 1946 national convention, but Commander Louis Starr made a last-ditch attempt to throw the decision out the window. Claiming that the "acoustics were bad" at the time the convention voted for indorsement, Starr said the action was not valid and would not be implemented. But when delegate Jack Kennedy, a World War II veteran who is now a Congressman from Massachusetts, said that if the vote on the T.-E.-W. bill were challenged he would challenge Starr's election on the ground that acoustics were equally bad when he was elected, Starr gave in. Under his leadership, naturally, the V. F. W. did not campaign very vigorously for the T.-E.-W. bill, but this year it has joined A. V. C. in a real effort to force action from Congress.

The position of the legion has been a bitter blow to the housing hopes of ex-service men and has greatly aided the campaign of the real-estate lobbyists. In

CHAT PATTERSON was formerly national legislative director and is now chairman of the American Veterans' Committee, which has led the fight of veterans of World War II for better housing.

1946-47, under Commander Paul Griffith, the legion was the lobby's principal errand boy on Capitol Hill. At the legion's 1946 national convention the leaders arbitrarily killed any discussion of housing by appointing a so-called housing committee, which spent a year parroting the negative program of the lobbyists. At the 1947 convention the leaders resorted to the shockingly undemocratic procedure of counting delegates not actually on the floor as opposed to the T.-E.-W. bill. To prove its interest in the housing problem, and to keep veterans divided, the legion recently came forward with a so-called Veterans' Homestead Act which is obviously unsatisfactory and unworkable.

AT THE A. V. C.'s national convention in June, 1947, the delegates agreed that there was need for a demonstration of united veterans' support for the Taft-Ellender-Wagner bill. They therefore voted to call a national conference of all veterans' organizations in Washington and to demand action by Congress on the bill. With Franklin D. Roosevelt, Jr., A. V. C.'s national housing chairman as sponsor, the call was sent out, and thanks to the cooperation of such outstanding spokesmen for veterans' housing interests as Jack Kennedy of the V. F. W., Jack Javits of the Jewish War Veterans, Robert Wagner, Jr., of the Catholic War Veterans, Audie Murphy of the Disabled American Veterans, and Paul McCauley of the American Legion, the conference was held as scheduled. McCauley deserves particular credit for his courage in acting as the leader of the millions of legion members who support the T.-E.-W. bill. The legion national office, of course, not only refused to allow any official participation in the conference but made every effort to force McCauley to withdraw. The number of legionnaires who did attend was a shock to the hierarchy, and the next convention is expected to sing a different tune.

The position of Amvets on the T.-E.-W. bill has been confused. At their convention last year Senator McCarthy persuaded them to refrain from indorsing it specifically, saying he was going to introduce other legislation they would prefer to support. McCarthy's proposals, it turned out, closely paralleled the T.-E.-W. bill except for their rejection of public housing. When they met total defeat in both the joint Housing Committee and the Senate Banking Committee, the Amvets were left out on a limb. Now that the Senate has passed the T.-E.-W. bill, however, they are released from their obligation to support McCarthy's measure and are expected to join A. V. C., the V. F. W., and other ex-service men's groups in the House fight.

At the Washington conference the delegates divided into state groups and called on their own Senators and Congressmen. Senators Taft and Tobey pledged quick action by the Senate Banking Committee and early referral of the T.-E.-W. bill to the Senate floor. They kept

"Just think, in twenty years it will be all ours!"

their promise, and the Senate passed the bill last month.

The chief significance of the veterans' housing conference was that for the first time veterans were acting together as an organized group. Members of Congress were forced to listen, and many of them were perhaps surprised to learn that World War II veterans regard housing as the most important question before the Eightieth Congress. They have not been allowed to forget it either. After the conference the delegates went home and organized city and state councils on which the various veterans' organizations were represented. When the vote on the T.-E.-W. bill loomed in the Senate, these groups showed what they could do. In Chicago, where a tremendous job of organizing support for the bill has been done under the leadership of A. V. C.'s Hugh Will, the Illinois Veterans' Housing Council reported that telegrams went to the Illinois Senators from every veterans' group in the city. Their work paid off when Senator Brooks, long considered on the side of the real-estate lobby, voted a vigorous "nay" to the Cain amendment to strike public housing from the bill.

A big job remains to be done in the House. At this writing the petition to bring the T.-E.-W. bill out on the floor without waiting for action by the House Banking and Currency Committee bears more than 130 signatures. A. V. C. is now asking each member of the House to say whether or not he has signed. If he has not, the united veterans' council in his district will be notified and asked to follow up. Jesse Wolcott, chairman of the Banking and Currency Committee, has been forced to schedule hearings now that the Senate has passed the bill, but any measure he reports to the floor will be as weak as he can make it. He will certainly use his control of the committee to eliminate the public-housing section, which is vitally needed to give balance to the entire program. The veterans are determined to continue their campaign for the discharge petition as the only sure means of getting affirmative House action. They think they will succeed where they have failed in the past, because for the first time they are united.

II. A Plank in a Platform

BY CHARLES ABRAMS

FOURTEEN years after our first public-housing experiment we are no nearer solving the housing problem than when we started. In the years between 1934 and the present we have dashed from one emergency program to another. In 1935 we tore down slums to provide employment, in 1937 to give decent homes to a "third of the nation," in 1940 to build houses for defense. A year later we put up trailers, mudvilles, and makeshifts to house war workers.

Today a whole nation is immobilized by a housing shortage; 45 per cent of the veterans between twenty-one and twenty-four years of age vainly hunt places to live; only 165,000 homes have been built for slum dwellers; and new slums crop up from coast to coast.

What keeps America from alleviating its housing shortage is not a production problem. No one who has studied our war-time records doubts our ability to produce the million and a half houses we need annually if only we are determined to do it. It is not the cost. The maximum expense of a slumless America would be no more for a year than the expense of World War II was for three days.

The reason we have made no progress is our failure to resolve a conflict between ideologies. A major contest has developed for control of public moneys, credits, and powers. Five main groups, each with its own ideas on the social function of government, are seeking to direct the political policy in housing.

The laissez faire advocates. This group consists of those who think the federal government should keep its hands off all social reforms, including housing. They see such reforms as interference with business, a step toward socialism. Europe, they insist, is headed for doom because it has embarked on social security, planning, price control, and social reforms. We too shall fail unless we retrace our steps to the staid individualism of the nineteenth century. The intellectual angels of this group are Hayek and Von Mises, and its spokesman is the N. A. M. Its program for solving the housing problem is to abolish rent controls, lower taxes, get the government out of everything. Private enterprise will then rise to the occasion and build houses for everybody. It vehemently opposes public housing but completely ignores the building and lending lobby that has been campaigning for continued government intervention in housing and is the most serious threat to free enterprise.

CHARLES ABRAMS, housing adviser and columnist of the New York Post, *has been* The Nation's *adviser in the preparation of this issue. Mr. Abrams is author of "The Future of Housing" and "Revolution in Land," and of two pamphlets—" A Housing Program for America" and "Race Bias in Housing" (the last originally appeared as a series of articles in* The Nation). *He was formerly general counsel to the New York City Housing Authority.*

REMARKS

OF

HON. PAUL H. DOUGLAS

OF ILLINOIS

Mr. DOUGLAS. Mr. President, before the roll is called I should like to answer the statement made by the Senator from Ohio [Mr. BRICKER] with respect to the amendment now pending before the Senate.

The VICE PRESIDENT. No Senator has as yet voted. The Senator from Illinois is recognized.

EQUAL RIGHTS FOR ALL

Mr. DOUGLAS. Mr. President, I think we should be very careful to see what the exact effects will be of the amendment offered by the junior Senator from Ohio. It necessarily creates a sharp conflict within the hearts of all of us who want, on the one hand, to clear the slums and to provide decent housing for the slum dwellers and who, at the same time, feel very keenly that we should not treat any race as second-class citizens. We believe that all human beings are indeed children of God and that in our democracy they should be granted equal rights and opportunities. There are differences between individuals, but we want to see men judged and treated according to their individual merits and neither exalted nor depressed because of the accident of their birth.

The amendment of the Senator from Ohio will in any event probably be supported by the hard core of some 25 to 30 Senators on the other side of the aisle who agree with his thinking in virtually all matters. It will, of course, be opposed by the approximately 30 Senators from the Southern and border States.

Mr. IVES. Mr. President, will the Senator yield for a question?

The VICE PRESIDENT. Does the Senator from Illinois yield to the Senator from New York for a question?

Mr. DOUGLAS. I yield.

Mr. IVES. The Senator does not imply in that statement, does he, that all who support or may support this particular amendment, in doing so are opposed to the whole idea of public housing?

Mr. DOUGLAS. In no sense.

Mr. IVES. The Senator from New York expects to support the amendment, because he believes in the principle involved in it. The Senator from New York also wants to make it clear that he is also going to support the public-housing bill.

Mr. DOUGLAS. I want to say that no one could question the good motives of the junior Senator from New York. I certainly do not. I know that he has been a stalwart friend of slum clearance and public housing throughout his public career.

Mr. IVES. The Senator from New York thanks the distinguished Senator from Illinois.

Mr. CAPEHART. Mr. President, will the Senator yield?

Mr. DOUGLAS. I yield.

Mr. CAPEHART. It is not clear to me what the Senator from Illinois means when he says that 25 Senators on the Republican side of the aisle will vote with the able Senator from Ohio because they think as he does.

Mr. DOUGLAS. I simply mean that if we take the roll calls during this session we will find that there is a group of from 25 to 30 Senators who generally agree with the distinguished junior Senator from Ohio.

Mr. CAPEHART. Could it be possible that the Senator from Ohio might agree with the other 24 Senators.

Mr. DOUGLAS. That is correct. Let us say there is a community of feeling or a community of thought among them.

Mr. WHERRY. Mr. President, will the Senator yield for a parliamentary inquiry?

Mr. DOUGLAS. I yield.

Mr. WHERRY. I ask the Presiding Officer: What is the question before the Senate?

The VICE PRESIDENT. The question is on agreeing to the amendment lettered "A" offered by the Senator from Ohio [Mr. BRICKER].

Mr. WHERRY. Was there a vote on the amendment?

The VICE PRESIDENT. The yeas and nays were ordered, and the clerk began to call the roll, but no Senator voted before the Senator from Illinois obtained the floor.

Mr. DOUGLAS. Mr. President, the issue will turn on what we Democrats of the North and West, some 25 in number, who regard ourselves as liberals do on this matter together with what the small

but gallant group of liberal Republicans on the other side of the aisle decide to do.

Now what would happen if we voted for and hence adopted the Bricker amendment? The answer is very simple.

Mr. WHERRY. Mr. President, will the Senator yield?

The VICE PRESIDENT. Does the Senator from Illinois yield to the Senator from Nebraska?

Mr. DOUGLAS. I yield.

Mr. WHERRY. Does the Senator from Illinois mean that this small and gallant group of liberals is going to vote for the amendment or does he mean it is going to vote against it? Being liberals, of course, they would vote to support an amendment which provides that there shall be no discrimination. Which is the gallant group?

The VICE PRESIDENT. The Senator from Illinois yielded for a question.

Mr. DOUGLAS. What I am trying to say is that the amendment creates quite a storm in the hearts of 25 northern and western Democrats, and, I think, in the hearts of the small but gallant group of Republican liberals on the other side of the aisle.

Mr. WHERRY. Mr. President, will the Senator yield?

The VICE PRESIDENT. Does the Senator from Illinois yield to the Senator from Nebraska for a question?

Mr. DOUGLAS. I yield.

Mr. WHERRY. The Senator means the gallant group which is going to vote for the amendment?

Mr. DOUGLAS. I shall make my position clear very shortly, I will say to the distinguished minority leader.

Mr. BRIDGES. Mr. President, will the Senator yield?

The VICE PRESIDENT. Does the Senator from Illinois yield to the Senator from New Hampshire?

Mr. DOUGLAS. I should like to have a chance to finish my statement.

The VICE PRESIDENT. The Senator need not yield to any Senator.

Mr. DOUGLAS. There has been one sentence of discussion on my part and 10 sentences of query.

The VICE PRESIDENT. The Senate will be in order. The Senator from Illinois need not yield to anyone for any purpose.

AMENDMENT WOULD DEFEAT BILL

Mr. DOUGLAS. What would happen if we voted for and hence adopted the Bricker amendment? The answer is very simple. It would inevitably defeat the whole housing bill itself. I think every Member present in this Chamber knows that to be a fact, and knows why it is so. But it needs to be made plain to the people of the country.

In the first place, it would compel virtually all of the some thirty southern and border State Senators to vote against the housing bill as a whole, once this amendment were included in it. Many of them would do this with a heavy heart, for they believe in this bill and want to see it passed. But their sentiments and those of the people whom they represent are so intense on this question that if the choice is presented between added housing with the abolition of segregation in the housing projects of the South and no housing at all, they will choose no housing. We may deplore their feelings, as I personally do, but let us judge not, lest we ourselves be judged.

SOUTHERN SENATORS FAVOR HOUSING

Let me emphasize the fact that from all I can learn a large majority of the southern Senators are in favor of the bill in its present form without the Bricker amendment. The senior Senator from Louisiana [Mr. ELLENDER] has for years been one of the leading sponsors of this bill. In the present session, perhaps its two most vigorous and intelligent champions have been the distinguished Senator from South Carolina [Mr. MAYBANK] and the distinguished junior Senator from Alabama [Mr. SPARKMAN]. As a humble member of the Banking and Currency Committee with those Senators, I want to pay tribute to the devotion and public spirit with which they have fought for this measure. If the Bricker amendment is not included, they and a large majority of their southern and border colleagues will vote for the measure, and enable it with northern and western help to pass. But if the Bricker amendment is adopted, then all of them will move into opposition.

What then will the junior Senator from Ohio and those on the other side of the aisle who stand with him do? Here I want to speak with accuracy and clarity. First, let me say how grateful we are to such splendid Senators on our committee as the senior Senator from New Hampshire [Mr. TOBEY] and the junior Senator from Vermont [Mr. FLANDERS].

Mr. TOBEY. Mr. President, will the Senator yield?

Mr. DOUGLAS. I yield.

Mr. TOBEY. It so happens that I am the junior Senator from New Hampshire.

Mr. DOUGLAS. I beg the Senator's pardon.

Mr. PEPPER. Mr. President——

Mr. WHERRY. Mr. President, will the Senator yield?

Mr. DOUGLAS. I yield.

Mr. WHERRY. Did the Senator from Illinois mean the senior Senator from New Hampshire or the junior Senator from New Hampshire?

Mr. DOUGLAS. I meant the junior Senator from New Hampshire [Mr. TOBEY].

Mr. WHERRY. I thought the Senator was speaking of the other liberals.

Mr. DOUGLAS. Mr. President, with no disrespect to the other Senator from New Hampshire [Mr. BRIDGES] I can say that wherever Senator TOBEY sits, there is the head of the table.

AMENDMENT WOULD INVITE FILIBUSTER

Mr. PEPPER. Mr. President, will the Senator yield?

Mr. DOUGLAS. I yield.

Mr. PEPPER. The able Senator from Illinois has spoken about the probable opposition to this measure on the final vote if this amendment were incorporated in it. Is the Senator sanguine enough to believe that there would be a vote at any time soon if the amendment were incorporated in the bill?

Mr. DOUGLAS. I am afraid not.

Mr. WHERRY. Mr. President, will the Senator yield?

Mr. DOUGLAS. I yield.

Mr. WHERRY. Does the Senator think there would be a vote on anything involving civil rights if it were taken up for debate on the floor of the Senate—even including the cloture rule?

Mr. DOUGLAS. I should not like to enter into a discussion of the Wherry amendment to the rules of the Senate. I have already expressed my views in that connection. However, on the whole, I believe that makes it very difficult to bring these measures to a vote. I will say to the distinguished Senator from Nebraska that I did not raise this question. He himself raised it.

Mr. WHERRY. Why do we not put the cloture rule to a test and see whether or not we can end debate?

Mr. DOUGLAS. At the moment I am discussing the pending amendment.

I will say to the Senator from New Hampshire [Mr. TOBEY] and the junior Senator from Vermont [Mr. FLANDERS] that by their constructive criticism of the original measure they have greatly improved it, and in a very real sense they are coauthors of the bill. I for one cannot be too grateful to these men and to the group for whom they speak, and I am sure that the millions of people huddled together in body-weakening and soul-depleting slums, out of their darkness and their misery nevertheless recognize these men as their true defenders and champions. All honor to them. And all honor, too, to the senior Senator from Ohio [Mr. TAFT] for the way he has championed the cause of decent housing during the yast 4 years.

GROUP OPPOSES PUBLIC HOUSING

But the real question is what the 25 or 30 Senators on the other side of the aisle who join with the junior Senator from Ohio [Mr. BRICKER] will do. Here again I want to be both charitable and just. Unfortunately I have not had the opportunity to become well acquainted with the junior Senator from Ohio, but from what I have seen of him, I like him. He is friendly in manner, direct in speech, and has a saving sense of humor. He has been justly honored by his State and his party. I hope that what I have to say will not cause him a momen'ts pain, for that is the last thing on earth I wish to do.

Mr. TOBEY. Mr. President, will the Senator yield for a suggestion?

The VICE PRESIDENT. The Senator cannot yield for a suggestion. He can yield only for a question.

Mr. TOBEY. Mr. President, will the Senator yield for a question.

Mr. DOUGLAS. I yield for a question.

Mr. TOBEY. In justice to the visible evidence and the physical facts, would not the Senator from Illinois add to the statement with respect to the junior Senator from Ohio and the handsomest Member of this body on either side of the aisle?

Mr. DOUGLAS. I think that is probably correct. I hope that what I have to say will not cause him a moment's pain. That is the last thing on earth I wish to do. But surely it is permissible to point out that the Senator from Ohio has made no secret of his attitude toward the bill. He is opposed to it. He would be opposed to it without his amendment, but he would also be opposed to it if it were to include his amendment. I think he is opposed to

the bill on conscientious grounds. He does not believe that the Government should go into the business of clearing the slums and providing decent housing for low-income families living in the slums.

Mr. BRICKER. Mr. President, will the Senator yield for a question?

Mr. DOUGLAS. I yield.

Mr. BRICKER. My position was made clear yesterday. I am in favor of the slum elimination section. I am opposed to the public housing section. I favor the research section, and I am opposed to the farm housing section.

Mr. DOUGLAS. I respect the sincerity of the junior Senator from Ohio, although I disagree with his conclusions. I think the evil is so great that the Government should act. It is no idle mind-reading, therefore, when I say that the adoption of his amendment would not win over the junior Senator from Ohio to the support of the bill which he so sincerely dislikes. Nor, I am sure, would it win over the support of the large group of Republican Senators who feel as he does on this subject. Their group, when joined with the southern and border Senators, would then be sufficient to defeat the bill as a whole.

OUR CHOICE: 810,000 DWELLINGS

We therefore have the choice of voting for the Bricker amendment prohibiting segregation in public housing everywhere and thereby killing the whole program, or voting it down, enabling the act to be passed, the slums to be cleared, and the 810,000 dwellings to be constructed, and then let the localities themselves decide this question of segregation in public housing.

Mr. CAPEHART. Mr. President, will the Senator yield?

Mr DOUGLAS. I yield.

Mr. CAPEHART. Would the Senator be in favor of the amendment if he were certain that the bill would pass?

Mr. DOUGLAS. I am pretty certain that the bill would not pass.

Mr. CAPEHART. Will the Senator please answer my question? Would the Senator be in favor of the amendment if he were certain that the bill would pass?

Mr. DOUGLAS. Personally I do not believe in segregation; but I also know that the Southern States are firmly committed to that principle, and I do not want at this time to disrupt the United States of America during a period of grave national crisis when we are being threatened by the police state in order to force upon them what I believe to be correct.

Mr. KILGORE. Mr. President, will the Senator yield?

Mr. DOUGLAS. I yield.

Mr. KILGORE. I wonder if the Senator from Indiana could guarantee the passage of the bill with the amendment. Would he go so far as to say——

Mr. DOUGLAS. Mr. President, I ask unanimous consent that the Senator from Indiana may be permitted to answer the question of the Senator from West Virginia.

The VICE PRESIDENT. Is there objection?

Mr. CAPEHART. I intend to vote for the bill, and I intend to vote for the amendment. That is more than the able Senator from Illinois intends to do. He is going to vote against the amendment.

The VICE PRESIDENT. The Senator yielded only for a question.

Mr. DOUGLAS. As for me, the choice is clear. I want slum clearance and housing for 4,000,000 people. I want it for all groups, regardless of race, creed, or color. I should like to point out to my Negro friends what a large amount of housing they will get from this act.

Mr. WHERRY. Mr. President, will the Senator yield?

Mr. DOUGLAS. I yield.

Mr. WHERRY. Is the Senator going to vote for the amendment?

Mr. DOUGLAS. No; I am not going to vote for the amendment.

MORE NEGRO HOUSING POSSIBLE

I should like to point out to my Negro friends what a large amount of housing they will get under this act. At present Negroes occupy approximately 46,000 dwelling units in Federal Housing projects, or about one-third of the total. This does not mean that the Negroes, who form only one-tenth of the total population, have been unduly favored. Because of their poverty and the bad quarters in which many of them live, they need a third of the units. It does show, however, that the American cities as a whole have not discriminated against the Negroes in providing quarters for them.

Mr. WHERRY. Mr. President, will the Senator yield?

Mr. DOUGLAS. I am glad to yield. I feel as though this afternoon I were the bull in a Spanish bull ring, with the banderilleros opposite throwing in the darts. But I have learned to develop a

thick hide; and the toreador, the matador, the bandellero, or what have you, can now cast his darts.

(Manifestations of applause in the galleries.)

The VICE PRESIDENT. The occupants of the galleries are not permitted to engage in demonstrations of any sort.

Mr. WHERRY. Mr. President, will the Senator yield?

Mr. DOUGLAS. I yield.

Mr. WHERRY. I should like to ask a question; the Senator can call it a question from a banderillero or anything he wishes to call it; but I still am a Member of the Senate of the United States, and when the Senator from Illinois states that he is in favor of all these things, but then says he will not vote for them, I think I have a right to question him so that I can learn where he stands.

Mr. DOUGLAS. Certainly.

Mr. WHERRY. I should like to ask this question of the Senator——

The VICE PRESIDENT. Does the Senator from Illinois yield for a question?

Mr. DOUGLAS. I am glad to yield.

Mr. WHERRY. Does the junior Senator from Illinois think that if this bill passes without this amendment, one Negro family will have an opportunity to obtain quarters in any of the units which are to be built under this bill?

Mr. DOUGLAS. I certainly do.

Mr. WHERRY. Then why is the Senator from Illinois afraid to put it into the law?

Mr. DOUGLAS. Let me point out that of the approximately 140,000 units constructed by the Federal Housing Authority, I believe, exclusive of those originally built by the Public Works, 46,000 are now occupied by Negroes, or one-third of the total, despite the fact that Negroes form one-tenth of the population; and in virtually every southern city that I know of, dwellings have been constructed for Negroes.

Mr. WHERRY. Mr. President, will the Senator yield further?

Mr. DOUGLAS. I am glad to yield.

Mr. WHERRY. But in those units, Negroes are segregated; are they not?

Mr. DOUGLAS. That is true.

Mr. WHERRY. Then I renew the question. Here is a question for the local community to decide, through the Housing Authority. I ask this question of the Senator, most respectfully: Does he feel that these units can be built and handled in such a way that a Negro family can have an opportunity to move into qaurters in them, and, if so, why is not the Senator from Illinois in favor of writing such a provision into the law? What objection is there to doing so?

Mr. DOUGLAS. Because the South believes, I hope, in the principle of equal treatment for the races, but does not believe in intermingling the races. As I said to the Senator from Georgia during the debate a month ago, I think they see things from the wrong perspective, but it is their choice.

Mr. TOBEY. Mr. President, will the Senator yield for a question?

Mr. DOUGLAS. I am glad to yield for a question.

Mr. TOBEY. A moment ago the distinguished Senator from Illinois spoke of the bull fight and the toreadors and the gay banderilleros, and so forth. Is it not true that what was really in the heart of the Senator from Illinois was that he wanted to shy away from those who were trying to throw the bull? [Laughter.]

The VICE PRESIDENT. The Senate will be in order.

Mr. DOUGLAS. I welcome the wit of the Senator from New Hampshire.

Mr. WHERRY. Mr. President, will the Senator yield for another question?

Mr. DOUGLAS. I am very glad to yield for a question.

Mr. WHERRY. The Senator from Illinois not only shied away, but he has not even answered my question as yet.

Mr. DOUGLAS. I think I have.

Mr. WHERRY. Then does the Senator from Illinois feel that if there is to be equal opportunity in the case of the units to be authorized under this bill, even though such a provision is not contained in the statute, Negro families will have the same right that white families will have to occupy these units? Is that the Senator's statement?

Mr. DOUGLAS. The Negroes should have the same right that whites have for decent housing, according to their need.

Mr. WHERRY. Will they get it under this bill?

Mr. DOUGLAS. They will.

Mr. MAYBANK. Mr. President, will the Senator yield?

Mr. DOUGLAS. I yield.

Mr. MAYBANK. I wish to ask the Senator a question. Did he notice in the CONGRESSIONAL RECORD a statement that

when the hearings on housing were commenced before the Banking and Currency Committee, at the meeting of the full committee the chairman placed in the RECORD a statement showing the number of Negro units in Columbia, S. C., and in Charleston, S. C., and showing that there were more Negro units in Columbia than units for whites, and that in Charleston the number for Negroes was equal to the number for whites, although the populations of both of those cities are predominantly white?

Mr. DOUGLAS. Yes; and when the distinguished Senator from South Carolina was mayor of Charleston, as I recall, he constructed in that city two of the earliest public-housing units. One was for Negroes and one was for whites; and he gave equal treatment to the Negroes in that respect.

Mr. WHERRY. Mr. President, will the Senator yield for another question?

Mr. DOUGLAS. I am glad to yield.

Mr. WHERRY. Of course, that was under an authorization where provisions were made for segregation. However, I am speaking of the pending bill. Does the Senator from Illinois feel that under this bill the decision as to whether any units will be built for Negroes is to be left with the local housing authority, to be reaffirmed by the Housing Authority in Washington?

Mr. DOUGLAS. That is correct. But the Federal Housing Administrator could refuse to authorize the construction of projects which were unduly weighted in favor of one group.

DISTINGUISHED NEGROES OPPOSE AMENDMENT

Mr. HUMPHREY. Mr. President, will the Senator yield for a question?

Mr. DOUGLAS. I am glad to yield.

Mr. HUMPHREY. I should like to ask the Senator from Illinois whether he is familiar with a statement by the National Council of Negro Women, with offices at 1318 Vermont Avenue NW., Washington, D. C.

Mr. DOUGLAS. I have a copy of the statement, but I shall be glad to have the Senator from Minnesota explain to the Senate what it is.

The VICE PRESIDENT. The Senator from Minnesota cannot do so in the time of the Senator from Illinois, under the guise of a question.

Mr. DOUGLAS. Then, Mr. President, I would reply to the distinguished Senator from Minnesota that I do know of that statement, which has been issued by the National Council of Negro Women, under date of April 12. The president of that organization is Mrs. Mary McLeod Bethune, certainly one of the leading Negro women of the country. Mrs. Bethune says their organization is opposed to the so-called Bricker amendment because they believe it would kill the housing program.

I hope the distinguished junior Senator from Ohio will excuse me if I read some of the statements contained in this letter. The words used in it are not my words, but are Mrs. Bethune's words; I wish to make that point clear.

It says:

> Can we put our trust in the Cain-Bricker move—clearly calculated as it is to kill public housing? * * * Or do we work with our proven friends?

The answer they give is that they should oppose this amendment, as proposed, and should favor the passage of the bill without it.

I also have on my desk an article from the Chicago Defender, one of the largest Negro newspapers in the country, under date of April 9, opposing this amendment.

Mr. HUMPHREY. Mr. President, will the Senator yield for a further question?

Mr. DOUGLAS. I am glad to yield.

Mr. HUMPHREY. In reference to the question asked by the distinguished minority leader, the Senator from Nebraska [Mr. WHERRY], as to the number of houses or housing units which would be available to Negroes under Senate bill 1070, is not it true that according to the estimates made by the National Council of Negro Women, an organization which of course is fundamentally interested in the housing of more Negroes, under this bill, if housing for them is constructed in the same proportion as under the United States Housing Act of 1937, the American Negroes would receive 279,000 of the new homes?

Mr. DOUGLAS. That is correct; and those 279,000 houses would house approximately one and one-third million Negroes, or nearly 10 percent of the Negro population of the United States.

Mr. HUMPHREY. Mr. President, will the Senator yield for a further question?

Mr. DOUGLAS. I am glad to yield.

STRATEGY ENDANGERS MANY REFORMS

Mr. HUMPHREY. Let me make this comment in prefacing my question: One of the distinguished leaders in the field of housing, a fighting lawyer in New York

City, is Charles Abrams. He has had a great deal to do with the construction of Stuyvesant Town. I should like to ask the Senator from Illinois whether, as he has looked over the statement of the Council of Negro Women, he is familiar with what Charles Abrams had to say, and whether for the purposes of the Senate he would read what Charles Abrams had to say in reference to the pending amendment?

Mr. DOUGLAS. I shall omit the personal references in the statement by Mr. Abrams.

Mr. HUMPHREY. I think that is desirable.

Mr. DOUGLAS. I shall say that Charles Abrams, writing in the New York Post, declared:

> If the device—

In other words, the Cain-Bricker amendment—

> succeeds, it will become the forerunner of a whole series of efforts to use the civil-rights issue as an instrument for killing off civil reform.

He goes on to say that the civil-rights fight—

> must be made on many fronts, but in choosing the front there is no compulsion to accept the one the enemy designates.

I want to say immediately that I do not regard the Senator from Ohio, of course, as being in any sense such an enemy. I am simply quoting Mr. Abrams. I want to make that very clear.

Mr. HUMPHREY and Mr. WHERRY addressed the Chair.

The VICE PRESIDENT. Does the Senator from Illinois yield; and if so, to whom?

Mr. DOUGLAS. I should like to yield to the Senator from Minnesota first.

Mr. HUMPHREY. I wonder whether the junior Senator from Illinois has this statement by Charles Abrams, referring to the amendment:

> The Cain-Bricker maneuver is made not to advance equality but to destroy public housing. If it succeeds, it will have killed the program which has done more to point the way to real nonsegregation than any other measure in our time.

Mr. DOUGLAS. That is a continuation of the statement which I have read thus far.

Mr. HUMPHREY. Mr. President, may I merely ask one clarifying question?

Mr. DOUGLAS. I am very glad to yield.

Mr. HUMPHREY. Is it not true that under the statutes of our Nation, under the United States Code, we have basic civil-rights protections which can be applied, and are being applied, by the courts of the United States and by the executive departments?

Mr. DOUGLAS. I think there was a civil-rights law in 1866 on this issue.

Mr. HUMPHREY. I thank the Senator.

Mr. WHERRY and Mr. CAPEHART addressed the Chair.

The VICE PRESIDENT. Does the Senator from Illinois yield; and if so, to whom?

Mr. DOUGLAS. I think I should yield first to the Senator from Nebraska.

25 VOTES WOULD BE LOST

Mr. WHERRY. In view of all the observations made by the junior Senator from Minnesota and the statements made by the junior Senator from Illinois, I ask the Senator once again, if all those rights are guaranteed, if all this building were done under the Housing Act passed by the former Congress, which I helped pass, and which has worked satisfactorily, why cannot this matter be worked out in the pending bill? And if it can be, what is wrong about adopting the proposed amendment?

Mr. DOUGLAS. I will tell the Senator what is wrong with it. It would throw away 30 votes, or at least 25 southern votes, without any commensurate gain in support from across the aisle.

Mr. WHERRY. Mr. President, will the Senator yield for another question?

The VICE PRESIDENT. Does the Senator from Illinois yield to the Senator from Nebraska?

Mr. DOUGLAS. I yield.

Mr. WHERRY. But the local housing authority has the right to build the units. The local authority has the determination. The corporation or the local individual makes the application. It does not mean that all the units will be taken over by the people of any particular race or color.

Mr. DOUGLAS. No.

FOR NONSEGREGATION IN CHICAGO

Mr. WHERRY. But the right is vested in the local authority. All that is proposed by the amendment is that there shall not be segregation. What is wrong with that? Addressing myself to Senators who have been in favor of the

civil-rights bills, I inquire, what is wrong with that? It is up to the local authority to make the determination. Why not write it into the bill, if Senators mean what they say?

Mr. DOUGLAS. If it related only to the city of Chicago, I should vote for the Bricker amendment, to be applied to local housing projects in the city of Chicago.

Mr. WHERRY. Mr. President, will the Senator yield for a question?

The VICE PRESIDENT. Does the Senator from Illinois yield to the Senator from Nebraska?

Mr. DOUGLAS. I yield.

Mr. WHERRY. That is exactly what is provided. We provide the authority. The application to the Federal Government must originate with the local authority. That is the great burden of the pending legislation. According to the preamble, when private enterprise fails, and when the local community needs housing projects, the local community must originate the application, for it is wholly within its power, we were told the other day. I ask the Senator whether he was on the floor when I addressed certain questions to the Senator from Alabama [Mr. SPARKMAN]? He said, "The Federal Government has nothing to do with it. It originates with the local community." The local community makes the application and it issues the bonds. The local community decides who may live in the houses. The local community decides for whom the Government is going to build the houses. I ask the Senator, if that be true, and amendments are being written into the bill, why not write into it that there shall be no discrimination? It is solely within the power of the local community, through its local authorities, to do as it chooses about building units for people of all classes. If the Senator is not for that, he is not for the purpose of the bill, he is not for the people in the slums, he is not for those he is trying to help.

Mr. LONG and Mr. CAPEHART addressed the Chair.

The VICE PRESIDENT. Does the Senator from Illinois yield; and if so, to whom?

Mr. DOUGLAS. I should first like to reply to the Senator from Nebraska. While I am a new Member of this body, I have certainly had sufficient experience to enable me to know the meaning of language. I should like to remind the distinguished Senator from Nebraska that on page 2 of the amendment it is stated that every housing project must be operated "without discrimination or segregation." This would mean that in every single housing project of the South there would be a necessary intermingling of the races. And consequently, southern Senators would vote against the bill, and we would have no slum clearance or public housing. I should like to say——

Mr. WHERRY. Mr. President——

Mr. DOUGLAS. May I finish, please?

Mr. WHERRY. Mr. President, will the Senator yield for a question?

The VICE PRESIDENT. Does the Senator from Illinois yield to the Senator from Nebraska for a question?

Mr. DOUGLAS. I am delighted to yield for a question.

Mr. WHERRY. I thank the Senator. It is up to the local housing authority, is it not?

Mr. DOUGLAS. Under the amendment a community cannot get any housing unless in each housing unit asked for there is to be no segregation.

Mr. CAPEHART. Mr. President, will the Senator yield?

The VICE PRESIDENT. Does the Senator from Illinois yield to the Senator from Indiana for a question?

Mr. DOUGLAS. I yield.

Mr. CAPEHART. Does the able Senator from Illinois know that the National Association for the Advancement of the Colored People, headed by Mr. White, is for the Bricker amendment?

Mr. DOUGLAS. I think that is perhaps true. I have great respect for Mr. White, myself.

Mr. CAPEHART. Will the Senator read what they say, if I should hand the copy to him?

Mr. DOUGLAS. I should be very glad to have the Senator from Indiana read it.

The VICE PRESIDENT. The Senator from Indiana cannot read it under the guise of a question.

Mr. DOUGLAS. I should be very glad to read it for him. The Senator from Indiana has just handed me page 4,886 of the CONGRESSIONAL RECORD for April 20, containing a release which the Senator from Indiana put into the RECORD, quoting, "A press release which is undated, but which is issued by the Washington Bureau of the NAACP," under

date of April 18. Would the Senator from Indiana like to have me read it verbatim?

Mr. CAPEHART. I shall leave that to the Senator.

Mr. DOUGLAS. I shall be very glad to do so. I want to see that the Senator from Indiana gets full justice.

It reads as follows:

In telegrams to the Democratic majority leader, Senator SCOTT W. LUCAS, and Senator KENNETH S. WHERRY, Republican minority leader, the National Association for the Advancement of Colored People urged support not only for the amendment proposed by Senator JOHN W. BRICKER, Republican, Ohio, to the multimillion dollar public housing bill prohibiting segregation in public housing projects but asked for a broader amendment to cover all federally aided housing, public and private.

The telegrams, signed by Leslie S. Perry, Washington representative for the NAACP, said—

That apparently is not Mr. White, but it is Mr. Perry. It continues:

When the NAACP representative testified before the Senate Banking and Currency Committee on the housing bill, S. 1070, among other amendments advocated was one to prohibit racial segregation in Federal public housing.

We have studied the antisegregation amendment proposed by Senator BRICKER and believe as framed it would correct part of the serious housing situation confronting racial and other minority groups.

Federal funds should not be used to aid or subsidize by loans, grants, insurance, or any other means any housing, public or private, which segregates or otherwise discriminates against eligible citizens because of race, color, creed, or national origin.

We, therefore, urge support not only for the Bricker amendment but a broader one to cover all federally aided housing contemplated by the bill.

Since various public charges have been made regarding Senator BRICKER's motives in proposing the amendment—

I desire to say that I have not only never made such charge publicly or privately, but I have never questioned his sincerity, either publicly or in private, either orally or in a writing of any kind. The telegram goes on to say—

the association desires to point out that it looks to the legal effect of a proposed amendment or law; it does not probe the secret motives of the sponsor.

I shall go even further and say that I feel certain the motives of the junior Senator from Ohio are worthy in this respect.

Mr. CAPEHART. Mr. President, will the Senator yield for another question?

The VICE PRESIDENT. Does the Senator from Illinois yield to the Senator from Indiana?

Mr. DOUGLAS. I am delighted to do so.

Mr. CAPEHART. Does the Senator not know that the National Negro Council likewise is supporting the Bricker amendment?

Mr. DOUGLAS. I think that is correct.

Mr. CAPEHART. Will the Senator likewise, for the benefit of Senators, read a statement addressed to them in that respect?

Mr. DOUGLAS. I shall be delighted to do so. This seems to be a process in which I do the reading lessons for the Senator from Indiana, on this issue.

Mr. CAPEHART. I should be happy to read it, but I am not permitted to do so under the rules.

Mr. DOUGLAS. I shall be delighted to do so. I cannot read it as well as could the Senator, but I shall try to read it as loudly. It reads as follows:

COPY OF RESOLUTION SENT TO SENATOR LUCAS, MAJORITY DEMOCRATIC LEADER, SENATOR MYERS, DEMOCRATIC WHIP, SENATOR TAFT, CHAIRMAN, MINORITY POLICY COMMITTEE, AND SENATOR WHERRY, MINORITY REPUBLICAN LEADER, DEMANDING SUPPORT OF BRICKER ANTIDISCRIMINATION AND ANTISEGREGATION AMENDMENT IN MULTI-BILLION-DOLLAR NATIONAL HOUSING LEGISLATION BY THE NATIONAL NEGRO COUNCIL

The civil rights conference of the National Negro Council, in a resolution, protested the unanimous action of the Senate Democratic caucus in ordering the defeat of the Bricker antidiscrimination and antisegregation amendment, proposed for inclusion in the multi-billion-dollar national housing legislation. This apparent public and open conspiracy to sabotage the constitutional guaranties of equal rights to 13,000,000 Negroes, would actually give official sanction for all time to come to such denial of their civil rights in the pending housing bill.

Such Senate action on the heels of the filibuster debacle by the Democratic majority of the Eighty-first Congress would serve notice of the complete repudiation of the President's civil-rights promises and the platform pledges of the Democratic National Convention in Philadelphia last summer. * * *

The civil rights conference, therefore, calls upon the Democratic and Republican leadership in the Senate, in keeping with the civil-rights pledges of both parties in their platforms and in this first opportunity for a direct vote on civil rights for Negroes

in the Senate, to support the enactment of the Bricker antidiscrimination and antisegregation amendment as part and parcel of the national housing legislation or stand exposed for political insincerity and copartners with the Democrats in perpetuating the present Federal housing policies of racial discrimination and segregation.

EDGAR G. BROWN,
Director, National Negro Council.

I should like to say in reply to these statements that I think both gentlemen are mistaken. I am ready to appeal to history and to time that it is in the best interest of the Negro race that we carry through this housing program as planned, rather than to put in the bill an amendment which will inevitably defeat it and defeat all hope for rehousing 4,000,000 persons.

Mr. LONG. Mr. President, will the Senator yield for a question?

Mr. DOUGLAS. I shall be very glad to yield to the Senator from Louisiana.

Mr. LONG. Does the Senator realize that a large number of very excellent housing facilities have been constructed in the South exclusively for Negroes, and that many of the Negroes are very well pleased that the facilities have been built for Negroes and that the Negroes do not have to mix with the white people?

Mr. DOUGLAS. I shall not go into the question of segregation. My views on that question differ from those of southern Senators. I may say that we of the North should not try to sabotage housing in order to adopt an amendment the effect of which would be to defeat housing.

Mr. CAPEHART. Mr. President, will the Senator yield?

NO SMILE WITHOUT THE CHESHIRE CAT

Mr. DOUGLAS. Let me finish first. As a boy I used to read Alice in Wonderland. It is a good book for everyone, including United States Senators, to read. The Senators will probably remember the passage in Alice in Wonderland describing the smile of the Cheshire cat, which continued after the cat itself had faded from sight. That smile was not very substantial. There cannot be a smile without a Cheshire cat. On the question of housing, let me say that nonsegregated housing without a housing bill does not amount to anything—and I follow the example of the Senator from North Dakota [Mr. LANGER] by pounding the desk to emphasize that point.

Mr. CAPEHART. Mr. President, will the Senator yield for a question?

Mr. DOUGLAS. I am happy to yield to the Senator from Indiana.

Mr. CAPEHART. Who will vote against the housing bill if this amendment should be adopted? Why is the Senator so certain that the bill will be killed? Who is helping to kill it?

Mr. DOUGLAS. I am a proud resident of the Middle West, but I happened to grow up in Yankeeland, in the State of Maine. A Yankee proceeds to answer one question by asking another, and I should like to answer the Senator's question by asking, Would the Senator vote, and would all the Senators around him vote, for this bill even if it included the Bricker amendment?

Mr. CAPEHART. Mr. President, I stated a moment ago that I would vote for it. I shall vote for it with or without the Bricker amendment.

WOULD BLOCK SOUTHERN HOUSING

Mr. SPARKMAN. Mr. President, will the Senator yield?

Mr. DOUGLAS. I shall gladly yield to the distinguished Senator from Alabama.

Mr. SPARKMAN. The question has been repeatedly put to the Senator from Illinois with reference to the defeat of housing if the Bricker amendment should be adopted, and reference has been made, apparently, to the question of defeating the bill. What I want to ask the Senator from Illinois is this: It is true—is it not—that no housing project is to be imposed upon any city or any local housing authority, but it is to be placed there only upon application of the local authority?

Mr. DOUGLAS. That is correct.

Mr. SPARKMAN. Is it not merely good, practical sense, which we might as well recognize right here, that if the bill should pass and become law with an antisegregation amendment in it, no city or town in Southern States, where segregation is a custom and tradition, and, in most of those States, a part of the law, would have any housing project applied for; and is it not also a fact that the South is the place in which the Negroes most need housing?

Mr. DOUGLAS. The Senator from Alabama, as always, states the case accurately and with precision.

Mr. SPARKMAN. Is it not true, then, that for all practical purposes, public

housing, certainly so far as the Negro is concerned, would be defeated, bill or no bill, law or no law?

Mr. DOUGLAS. That is correct.

MEANING OF AMENDMENT'S DEFEAT

Mr. IVES. Mr. President, will the Senator yield?

Mr. DOUGLAS. I shall be glad to yield to the distinguished Senator from New York.

Mr. IVES. The Senator from New York does not want to enter into any debate that would in any way do damage to the bill itself, because the Senator from New York favors the bill, but the Senator from New York would like to ask the distinguished Senator from Illinois a question which, I think, is rather far reaching. Assuming the pending amendment comes to a vote and is rejected, will not its rejection be at least an implication, if not a direct indication, that the Senate of the United States condones and approves segregation and discrimination in public housing?

Mr. DOUGLAS. I do not believe that any such implication or inference can be drawn. I do not believe in segregation in public housing. We are moving away from it in the North, and we shall continue to move away from it if this bill is passed. It is simply that we who oppose this amendment place the cause of existent housing as the most important thing, and we do not want to endanger it by adopting a provision which will throw the whole South into opposition to the measure. I think, as a northerner, I perhaps can speak on this subject, because, without indulging in mock heroics in the slightest, I know that I am taking a political hazard in making this speech.

Mr. TOBEY. Mr. President, will the Senator yield?

Mr. DOUGLAS. I shall gladly yield to the distinguished Senator from New Hampshire.

Mr. TOBEY. Referring to the remarks of our distinguished friend from New York, I ask this question: In view of the fact that the court always looks at the committee hearings and the record of debate on the floor in considering legislation, will not any fair-minded person examine the record and see the motivating purpose behind the legislation?

Mr. DOUGLAS. That is the reason I rose today to speak. Some persons have been telephoning me all day long, saying, "Do not speak on this issue, because whatever you say will be misunderstood and used against you." But I felt it was important to make the issue clear. Every Senator knows what the issue is, but the public does not know, and the courts may not know what the issue is. That is why I rose and, in my humble and incomplete way, tried to make clear what is the real issue.

NEGROES OPPOSE SEGREGATION

Mr. LONG. Mr. President, will the Senator yield?

Mr. DOUGLAS. I yield.

Mr. LONG. Is it not true that insofar as public housing is concerned, segregation would not at all amount to discrimination, for the reason that the housing facilities would be the same, whether they were constructed for white persons or colored persons?

Mr. DOUGLAS. I should like to say to my good friend from Louisiana that I think white men should realize the feelings black men inevitably have when they are told that because of the fact of color they are marked off, isolated, and cannot associate with white persons. I think the pain of being a black man in the United States of America is very great. So I do not think the Senator from Louisiana should excuse the southern position on that point by saying that Negroes want to be segregated. Perhaps some of them do; but, certainly, every man has the desire to be treated as a human being and accepted on his individual merits. As I say, I am between Scylla and Charybdis. I hope the classical Senator from New Hampshire [Mr. TOBEY] will correct me if I am wrong. I have been between Scylla on that side, and Charybdis on the other side, and it is quite possible that my ship will strike a rock somewhere between.

Mr. KNOWLAND. Mr. President, will the Senator yield?

Mr. DOUGLAS. I yield to the group from Scylla.

Mr. KNOWLAND. Mr. President, I should like to ask the distinguished Senator if I correctly understood him to say that the amendment would endanger the legislation for the simple reason, as was pointed out by the Senator from Alabama, that the States where the need is great would take advantage of the situation. Is that correct?

Mr. DOUGLAS. That is only a part of the story. It would prevent any public housing in the South. In my judgment, it would also probably defeat the pur-

pose of the bill in the North itself and would result in no housing for the North, because, while I very much appreciate the generosity of the Senator from Indiana, my neighbor, I cannot believe that he speaks for any considerable number of the 25 or 30 Senators on the other side of the aisle who generally have an affinity for each others views.

FOR NONSEGREGATION IN WASHINGTON

Mr. KNOWLAND. Mr. President, I should like to ask the able Senator from Illinois a question. In view of the statement he previously made that had this been Chicago he would have felt differently about the question we are discussing, and since the Senator from Illinois is on the floor of the United States Senate in a dual capacity, first as a Senator of the United States legislating for the entire country, and secondly as, in effect, a member of the municipal governing body of the city of Washington, I ask him whether he would feel that there was a different situation presented if an amendment were offered which would provide that in the Nation's Capital, the capital of the United States of America, no public housing should be built under segregated conditions. A few days ago the able Senator from Maryland and the able Senator from Michigan were talking about making the United States capital a kind of an example to the country. Would the able Senator from Illinois support an amendment providing that no public housing built within the District of Columbia should be segregated?

Mr. DOUGLAS. Mr. President, with full sense of the solemnity of my words, not as having any importance as coming from myself, I can say that I would support such an amendment. I think we have an obligation to realize that Washington is not merely a southern city, or a border city, but that it is the National Capital, and I think such a provision as that indicated by the Senator would be proper as coming from the Congress in the capacity of a municipal body, and I would vote for it.

Mr. CAPEHART. Mr. President——

The VICE PRESIDENT. Does the Senator from Illinois yield to the Senator from Indiana?

Mr. DOUGLAS. I should like to point out, if I may, that I have tried to be extremely generous to those who have asked questions. I had a prepared statement which I had hoped I could finish in 15 minutes. I recognize that as a freshman Senator, I should not take too much of the Senate's time, and I had hoped to conclude very shortly. I have been on my feet almost an hour and nearly all the time has been taken up in discussion with other Senators. I think I have shown that I am ready to answer questions, but in simple justice and kindness I should like to ask that I be permitted to complete my address, and then if my unworthy remarks justify any questions, I shall endeavor to reply.

Oliver Wendell Holmes began the Autocrat of the Breakfast Table by saying, "As I was saying when I was interrupted." As I was saying when I was interrupted some half hour ago, to me the choice is clear. I want slum clearance, and housing for 4,000,000 people. I want it for all groups, regardless of race, creed, and color.

270,000 NEW NEGRO HOMES

I should like to point out to my Negro friends what a large amount of housing they will get out of this act. At present, Negroes occupy approximately 46,000 dwelling units in Federal housing projects, or about one-third of the total. This does not mean that the Negroes, who form only one-tenth of the total population, have been unduly favored. Because of their poverty, and the bad quarters in which many of them live, they needed a third of the units. It does show, however, that the American cities as a whole have not discriminated against the Negroes in providing quarters for them.

I would expect that this approximate ratio will continue in the future, so that the Negroes stand to get under the proposed act about 270,000 dwelling units, or enough to house about one and one-third million people. This is nearly one-tenth of the Negro population of the country. I should like to ask those who are opposing my stand if this is something which should be lightly turned down. We have the chance to build a happier home life and to reduce the sickness and deaths amongst the Negro community by passing this bill and by providing for 1 out of every 10 Negroes. Is this not more important than asserting the right to nonsegregation in houses which will not be built? I prefer the substantial benefits which the act will bring. As we raise the level of housing, health, and education for Negroes and whites alike, and open up job opportunities more broadly, the severity of many

of our race problems will be lessened, and we will find that the groups will be able to live in the same communities on better terms.

MORE UNSEGREGATED HOUSING

It should also be noted that the increase in public housing in the North will decrease the total amount of segregation which now exists. We northerners should be frank to admit that most of our communities do practice many forms of segregation. It is not done as openly or as sharply as in the South, but it is practiced. But the point is, and it is an important one, that we are ashamed of it in our hearts, and that we are seeking to reduce it. The trend in the North is away from segregation, and while we have all varieties of practices in the housing authorities, we are moving away from it there. Some cities like Detroit, I believe, do practice segregation, but others like New York, Pittsburgh, Chicago, and Los Angeles do not. And it may be interesting to know that after the initial shock is over, no alarming consequences result.

I should like to call the attention of my southern friends to this statement, which I repeat, that after the initial shock is over, no alarming consequences result. Both sides settle down and discover that those in the other group are not bad fellows after all. To defeat more housing by adopting the Bricker amendment would, therefore, actually prevent the development of this tendency toward better understanding between the races in the North and West.

SUBSTANTIAL GAINS POSSIBLE

It seems to me that we shall make more progress if we build up, as I have said, the general level of housing, education, health, and job opportunities. I cannot believe that those groups are wise who in trying to get everything at once defeat the possibility of getting something substantial now. We should not try to legislate on everything at once. There are some problems which we can leave to the future.

I have quoted the attitude of the National Council of Negro Women, the Chicago Defender, and the material from the NAACP and the National Negro Council.

There is one final note on which I should like to conclude. I think we northern Democrats have shown that we are not demagogues trying to get votes at any price.

We could take a demagogic position on this bill, go with a whoop hurrah for the pending amendment, and pretend to be for both public housing and against segregation. That would be vote-getting tactics to adopt, so far as the North was concerned. It would certainly be vote-getting tactics so far as my own State of Illinois was concerned. I do not want to pin too many roses on us, but I want to say that we have not acted that way.

Mr. THYE. Mr. President, will the Senator yield?

Mr. DOUGLAS. I yield to the Senator from Minnesota.

Mr. THYE. Would the Senator be so generous as to include a few of the northern Republicans in the very generous statement he made concerning the northern Democrats?

Mr. DOUGLAS. I would most certainly do so. And I do not want the Senator from Ohio to think that I am saying that those who favor the amendment are demagogs. I do not mean that at all, and I hope he will not think so, because that is not in my thought. But I do want to say that those of us who are opposing the amendment, at political risk, cannot be accused of being demagogs.

Mr. BRICKER. Mr. President, the Senator does not pose as an expert on who is and who is not a demagog, does he?

Mr. DOUGLAS. Certainly not, and I did not want to indulge in too much self-laudation. What I am going to say is primarily for my southern brethren, because I am coming to them in a moment. What I say is that we northerners, Republicans and Democrats alike, who vote against the amendment, are not demagogs.

CIVIL RIGHTS RESOLVE

All we are seeking is the welfare of our country as we see it, but as we decline to make political capital out of this issue, and have exposed ourselves to attacks and misunderstandings amongst our constituents, we must assume a still greater moral responsibility for supporting the civil-rights program which we Democrats adopted at Philadelphia, and which the Republicans, perhaps in a little bit less definite language, but certainly, I would like to believe, with equal ardor in their hearts, adopted.

APPEAL TO SOUTHERNERS

Mr. President, I should like to say to my southern friends that just as we have

refused to make political capital out of this issue, they, too, should give a little. I do not know that I can thump the desk as vigorously as does my friend the senior Senator from North Dakota [Mr. LANGER], but I will do the best I can to emphasize my admonition. I want to say to my southern friends that if we decline to make political capital of this issue, they should not be so unyielding on civil rights. Give a little on your side.

Thus, having made everyone angry [laughter], and probably having cut my political throat from ear to ear, but having tried to speak the truth as I see it, at long last I sit down.

80TH CONGRESS
2D SESSION

S. 866

IN THE HOUSE OF REPRESENTATIVES

APRIL 26, 1948

Referred to the Committee on Banking and Currency

AN ACT

To establish a national housing objective and the policy to be followed in the attainment thereof, to facilitate sustained progress in the attainment of such objective, and for other purposes.

Be it enacted by the Senate and House of Representatives of the United States of America in Congress assembled, That this Act may be cited as the "Housing Act of 1948".

DECLARATION OF NATIONAL HOUSING POLICY

SEC. 2. The Congress hereby declares that the general welfare and security of the Nation and the health and living standards of its people require a production of residential construction and related community development sufficient to remedy the serious cumulative housing shortage, to eliminate

1 - Atlanta, City of

The Black Heart of Atlanta

D. A. CRANE, Arch. '49

(Ga. Tech Engineer - Vol. 19, No. 4, May '49)

A condensation of research material compiled by students of Senior Architectural Design, Georgia Institute of Technology.

WHEN ARCHITECTURAL DESIGN students at Georgia Tech began to study how Atlanta's worst slum area, Census Tracts F-17, F-18, F-28, and F-29, might be cleared up, they were shown development plans for the Greater London Plan. They thought to themselves of the vast opportunity London has had to rebuild from the ashes a city capable of housing millions of people engaged in thousands of activities, not originally anticipated when medieval architecture conceived the Greater London. They thought to themselves how wonderful it would be if the "black heart" of Atlanta slums were to be levelled by bombs tomorrow. Certainly, it would seem, such a destruction, bloody as it might be, would in the end save more lives lost from crime and tuberculosis than it would destroy. And, it seemed to these students, such a temporary destruction would ultimately become a construction of a foundation of good community citizenship—apparently the only way to arouse a politically decayed citizenship to put an end to crime, disease, poverty, and land-owners' greed.

The mission of architecture in contributing to the cleanup of Census Tracts F-17, F-18, F-28, and F-29 would appear to point primarily at recreational and residential development. To improve the "machine for living," as the house has been termed by le Corbusier, becomes only a subsidiary goal of architecture. The principal area where architecture and allied arts and sciences can best serve human welfare is probably in the field of community and city planning—developing for all men at least a minimum in living comfort. To build structures "low and intimately related to the soil" is one thing—to build simple, cheap housing for all men, regardless of their pocketbooks or color, is another. All men should have a good standard of living, evidenced most by the buildings in which they eat, sleep, work, and play. The Frank Lloyd Wright ideal of beautiful, "stirring" structures for those few who can afford "art for art's sake" is a rejection of the social responsibilities.

Architectural students in senior design courses at Georgia Tech were given the problem of investigating Census Tracts F17, F-18, F-28, and F-29 as to sociological factors to be considered as essential in writing the comprehensive program for a new community. These students were asked to make their studies along two lines—the general (or optimum) phase, and the existing conditions. Existing conditions were not particularly difficult to ascertain, but, in the general phase of investigating what is to be desired, students were stimulated little, if any, by planners and people in responsible positions of city agencies.

A researcher might ask, "How many well-baby clinics do you need?" The answer would almost invariably be, "We don't know." This lack of imagination indicated that conditions have been substandard for so long that, given the opportunity and money, it is likely that it would take years to set a definite criterion for improvement. That anything in a community, now swallowing $9.00 of municipal and state services for every $1.00 tax return, would ever be changed seemed inconceivable to authorities working in this "black heart" of Atlanta slums. Researching students were dismayed that slum conditions come to be accepted as inevitable.

A slum is defined as a district in which there are 75 per cent or more houses which are unsafe, unhealthy, or detrimental to good morals. For their research on Atlanta slums, the design students from the School of Architecture, Georgia Institute of Technology, were given the worst possible portion of the blighted areas. This section, chosen for convenience as Census Tracts F-17, F-18, F-28, and F-29, is bounded by North Avenue, on the north, Piedmont Avenue and Courtland Avenue, on the west, Edgewood Avenue, on the south, and the Southern Railway Belt Line, on the east. The four tracts are separated by Baker Street and Highland Avenue, running east and west, and Boulevard, running north and south. The tracts are, clockwise from the northeast corner, F-18, F-17, F-29, and F-28. Since the great Atlanta Fire of 1917, which wiped out a large part of this area, it has developed into a great mass of derelict construction and falls easily into the 75 per cent limit of substandard dwellings.

Vital Statistics

In these tracts residential density is found to be rather variable. In Tract F-17, an essentially white community of relatively good conditions, we find a density of 12,600 persons per square mile. On the other hand, Tract F-28 has a population density of 32,600 persons per square mile. Tracts F-18, F-28, and F-29 have over 83 per cent non-white residents. The total population of all four tracts is 31,265, as of the 1940 Census.

← Alleyway entrances to residences in Atlanta Census Tract F-28.

Figure 1. Breakdown of population and pertinent housing statistics by census tracts.

The income average per family is found to be not quite as low as might have been expected in an area of this type. However, most of these families have more than one member working. There are 68.3 per cent of the households which have an income of $150.00 per month or more, and 21.1 per cent have a family income of $250.00 or more. The family budget is further improved by low rent payments, 72.7 per cent paying less than $20.00 per month. Although it is safe to say these rented hovels are not worth more than that, indications are that, on the average, these people could afford to pay for the better living quarters which might be provided by public housing.

Disease and crime are prevalent in these tracts. Tract F-28 reported more new cases of tuberculosis in 1948 than any other tract in Atlanta. Tracts F-18 and F-29 also reported a large number of cases, comparatively speaking. We find more criminal offenses, juvenile delinquency, and decay of all types in these areas than anywhere in Atlanta. The mortality rate is much greater than the birth rate, but, due to influx of people seeking warrens of any description and the lure of accelerated industrial jobs, the population is growing more dense.

Residential Density and Land Coverage

An area may have a relatively high residential density and still retain desirable living conditions if there is enough open area to satisfy the requirements of light, air, recreation and playground, and aesthetic need for pleasant surroundings. Land coverage includes the land occupied by dwellings, businesses, and incidental structures, as well as streets and alleys. Land covered by buildings should not exceed 30 per cent within a residential district, and street area should not be in excess of 10 per cent. Residential density should be less than 100 people per acre, unless, of course, the land is at a high premium.

In the tracts under consideration, it is seen that population density is well under the limit of 100 per acre and dwelling units fall far short of the 60 units per acre maximum. Pertinent statistics on residential and dwelling unit densities are seen in Fig. 1. On the other hand, we find that in Fig. 2, showing land coverage, considerably more than 30 per cent of the total area is covered by buildings. While F-17 has a coverage of only 24.5 per cent, with an average height in stories per building of 1.2, Tract F-28 has a 59.5 per cent coverage, and average stories per building of 1.5. Tract F-18 has a 46.1 per cent coverage, and 43.5 per cent of Tract F-29 is encumbered with low, ramshackle dwellings. The indication is that this area could house thousands more if the land were utilized more efficiently and encumbrances of chicken coops, pig pens, and other parasitical structures were eliminated.

Implementation

Studies were made of the land value in Census Tracts F-17, F-18, F-28, and F-29. Cost of land in this slum area is exorbitantly high, primarily because

Figure 2. Area representation of land encumbered by parasitical structures.

real estate owners can make great profits off houses requiring no input for maintenance and repair. High-priced land can in a very few years be paid for by high returns on the investment, even at cheap rental prices. A typical block for the Negro district was found to cost approximately $65,400. This is true because of the fact that, being more crowded, there are many more lots to a block than in the white area of F-17, where a typical block costs approximately $45,500. Negro areas, comprising two-thirds of the whole, cost $16,650 per acre, while white areas cost approximately $11,700 per acre. At the present-day value of real estate, the price of the total area of the four tracts, $25,508,000, is double the tax assessor's value of $12,-754,000. Thus do unscrupulous landowners exploit misery and need for shelter.

To clear up this area and construct the necessary housing projects would take a large federal appropriation. To secure the desired territory, the city planning commission would turn over to the "Atlanta Real Estate Board" the district for appraisal. When the board settled upon the sum to be paid, the city would then contribute this amount to the courts. These courts would then be obligated to procure the property at the set price, or, through the "Right of Eminent Domain," condemn the land in a trial process and force the owner to accept its own price. It is likely that no jury in Atlanta will ever sustain such a condemnation procedure until public opinion is aroused against owners exploiting the market for new housing.

Open Space and Recreation

Parks, green areas, and other outdoor recreational areas are practically non-existent in Tracts F-17, F-18, F-28, and F-29. Those which do exist are pitifully substandard and inadequate for a district of this size. The importance of recreation areas and facilities in city planning cannot be denied. Crime and disease prevention can be controlled to a great degree by providing enjoyable leisure-time occupation. Without such areas, this "black heart" will continue to be a parasite of moral and social decay in Atlanta.

Cities today are spending great sums of money to acquire needed recreation space in densely populated neighborhoods. A few years ago land for this purpose was available at low cost. The execution of the proposed National Housing Program will probably reduce the open space in existing neighborhoods and will cover with dwellings large areas where limited recreation areas are already inadequate. Atlanta is fortunate in having the opportunity to benefit from past mistakes in other cities. We can wipe out Census Tracts F-17, F-18, F-28, and F-29, buy the land, and construct a community whose recreation needs are realized in the initial conception of the project. Such an investment would return money to the city now spent in crime, fire, and disease prevention.

A typical example of outdoor toilet facilities in F-17, F-18, F-28, and F-29

Health Factors

Henry W. Grady Hospital, at 36 Butler Street, is fairly adequate to maintain hospitalization for all the persons living in F-17, F-18, F-28, and F-29. It is, however, subject to crowded conditions in the Negro maternity wards, and patients often are required to leave a day and a half after delivery. Because of a high rate of still-births and the birthrate, expectant mothers and well babies are the principal area of medical care. Public health nurses who go into homes to instruct and care for mothers and babies are not enough for the demand. One colored public health nurse is available and active in this entire area. At least one per census tract is needed. The nearest prenatal clinic for expectant white mothers is one and a half miles north of the boundary of F-17, the white neighborhood. A prenatal clinic for colored mothers is held at Grady Hospital, but this service could be provided more efficiently with the construction of well-baby clinics in each tract. Social diseases are treated at the Atlanta Health Center No. 1, within commuting distance of the slum area. This center is kept constantly overcrowded because dirt and immorality in the slum areas more than keep abreast of the curing rate.

Construction of well-baby clinics in this area would provide more facilities for tuberculosis detection and prevention. These clinics would be used for X-ray operations by tuberculosis mobile units. An out-patient clinic for treating wounds incurred by criminal assaults and other crime is sorely needed, but it is certain that a clean-up of this area would reduce crime and subsequently the need for treating the injured. There are no colored dental facilities available in this area, and a Negro dental clinic is needed.

Health maintenance will never be adequate without a complete new construction of the community. Structures in this area are entirely opposed to the concept of health. At least 12 per cent of dwellings have their access in narrow alleys or someone else's pig pen. Twenty-two per cent of the houses are without kitchen sinks and 23 per cent have only back-yard water-taps, shared with other families. Seventy-eight per cent of

the families in these tracts have no washing facilities such as a wash basin or laundry tub. Only 33 per cent of these families have inside, private toilet facilities, and 45 per cent have no bath facilities. Ninety-five per cent of the dwelling units have no central heating, and 98 per cent of the families have less than one-half their rooms heated at all. Fifty-five per cent of all dwelling units have one or more rooms whose areas are substandard from the standpoint of air cubage and occupancy. Thirty-seven per cent of all units have a plague of rats and other rodents or insects. It is small wonder that tuberculosis mortality rates in F-18, F-28, and F-29 are higher than anywhere else in Atlanta.

Education

There are three elementary schools in Census Tracts F-17, F-18, F-28, and F-29. Hill School and John Hope (now under construction) are Negro schools, while N. B. Forrest School is the only white elementary school. There is one Negro high school, David T. Howard High, and no white high schools are located in the area. The total attendance at these schools is 4,705, indicating that these schools draw approximately one-half of the school-age children in the area. Laws for the compulsion of school-age children to attend school seem to be strict enough, but it is doubtful whether any, Negro or white, obtain the service from education that they are entitled to. An interesting fact is that Hill School for Negroes, with an attendance of 2010, has buildings worth $84,933. On the other hand, Forrest School, for whites, with an attendance of 396, has buildings worth $155,322. Thus, the Forrest School is worth per pupil 9.35 times the value per pupil of Hill School for Negroes. Hill School has 21 classes of over 50 students per class per hour.

The sub-community seen as an integration of organic cells.

Other Sociological Factors

Entertainment and recreation facilities in Tracts F-17, F-18, F-28, and F-29 are inadequate. No theaters can be said to exist in this area, and it is obvious that great distances must be travelled to reach decent cinemas. A vocational school in the colored section provides a small playground for the children of both races. No swimming pools or park areas are to be found—the nearest park is some distance beyond the Southern Railway Freight Belt Line on the east. There are no branch libraries to provide recreation through reading. Buildings and areas for family groups to recreate do not exist. In the vicinity of the five schools in or neighboring this section under consideration are playgrounds, and daily programs of after school activities

(Continued on Page 32)

The neighborhood unit is a machine for the satisfaction of every basic need.

Black Heart

(Continued from Page 10)

are conducted. These areas are insufficient and, in most cases, are in poor repair.

It is interesting to note that occupational patterns in these tracts are relatively uniform, with the exception of F-17, which is largely a white community. Predominant occupational types in F-18, F-28, and F-29 are as follows: 33 per cent domestic workers, 22 per cent to 30 per cent other service workers, 16 per cent to 17.5 per cent operative and kindred workers. In F-17, 35 per cent are clerical and sales workers, 12 per cent are proprietors, managers, or officials, and 13 per cent are operative and kindred workers. Researchers found it difficult to ascertain how many workers from outside this area come in to man the industries contained therein. From the fact that 24 per cent of the working population in F-28, 15.4 per cent in F-17, 14.6 per cent in F-18, and 21.3 per cent in F-29 remain in their respective tracts for their jobs, the conclusion is drawn that the largest part of the working population work far from their homes. At the same time, their homes are blighted by industries, uncontrolled, which draw thousands of workers from outside the area.

In planning for a new community, many racial problems arise. The conception of a community designed to provide the recreation and social intercourse so necessary to a well-balanced life is contrary to the problem of race differences. Architectural students engaged in making development studies of the area under consideration have come to the conclusion that a new development cannot force an issue of such

(Continued on Page 34)

Black Heart

(Continued from Page 32)

strong controversy. These planners, however, propose to design facilities within communities which are flexible —looking forward to the possibility that in some years to come race problems will not be a factor.

In any event, student planners intend to do what is within the realm of architecture and engineering to abolish racial discrimination. Racial segregation may or may not be necessary, but discrimination in facilities cannot be tolerated. It is maintained by these students that, whereas the Negro probably does not want social intercourse with the whites, he feels slighted when he is forced to enter small back doors of train stations while a white man enters through monumental portals. The mission of this architectural plan will, therefore, be to create equal facilities for living, playing, working, eating, shopping and worshipping.

Architectural Concept of the Sub-Community

In making a research on this "black heart" of Atlanta slums, students have found that the section is mostly residential. In recommending a remedy for this blighted condition, any architectural program of planning is based on the premise that Tracts F-17, F-18, F-28, and F-29 should be made into a group of neighborhood units, each essentially like the others. Since the architectural solutions to this problem are unlimited in number and scope, we here endeavor to discuss the general concept of the sub-community as it should be and as it has been conceived in certain localities. Within a month, the senior design students of the School of Architecture of Georgia Tech will have emerged from their studies with comprehensive plans for the entire area, a given neighborhood unit, and the principal buildings comprising the typical neighborhood. It is important, however, not to think in terms defined by this group or any other group of planners, but to think of the moral problem involved and adapt the criteria made elsewhere to good advantage in wiping a blemish from Atlanta's face.

The land-use plan of each sub-community (taken here to relate to the area including all four census tracts) is an integral part of the land-use plan of the metropolitan area, but within its confines it should be balanced and should be related to the needs of the residents and their characteristics. Likewise, the individual cells of each sub-community should be related to the overall plan of the sub-community while at the same time achieve neighborhood unity.

The cells of a sub-community should include a secondary business center, the function of which is similar to that of the central business district. Several light industrial districts should be located in such a way as to employ a number of people in jobs close to their homes, thus reducing the cost in time, money, and energy of employees and affording a maximum of time and energy for neighborhood social life. One or more heavy industrial districts may be placed so as to be convenient to employees living in the sub-community or to good transportation facilities. Another integral cell would be some major recreational, civic, health, or social facilities which cannot be provided for each neighborhood unit. All other major cells of the sub-community would be the neighborhood units, sufficient in number to accommodate the anticipated population of the sub-com-

(Continued on Page 36)

Black Heart

(Continued from Page 34)

munity. In general, the cells of the sub-community are bounded by, rather than intersected by, the limited access streets. Through traffic should be routed around the sub-community by large surface high-speed boulevards or depressed highways. The neighborhood units must be adequately insulated from the industrial districts and from the major thoroughfares by well-planted "minor green belts."

The Concept of the Neighborhood Unit

Fundamental social objectives in the neighborhood unit must be considered. It is necessary that residents have the time, energy, and opportunities to make desirable social contacts, and the design of the neighborhood unit should be directed towards the encouragement of neighborly relations. Although each should be large enough to enable each individual to find many others of compatible interests, a reasonable degree of segregation of housing types is to be desired for both social and aesthetic reasons. There should be enough different types of housing to interest people from many income and intellectual groups. By social intermingling, it may be expected that intellectual and civic leaders would soon tend to raise their neighbors to their level of social responsibility. Public and semi-public activities, such as churches, lodge organizations, clubs, and societies, would receive from a varied populace financial and interested support. Provision in land-use plans should be made for semi-public as well as public buildings. Instead of the rotten apple in the barrel causing the decay of all the apples, we base our concept of neighborhood

(Continued on Page 38)

Black Heart

(Continued from Page 36)

strength on the premise that a good citizen will destroy decay in poor citizens.

The most important single factor in making the neighborhood unit concept work toward social unity would be the educational system and program. An educational system should be designed to include an influence on all the people within the unit, and mere buildings in which children are taught cannot be considered as an ultimate goal. The public educational system should be extended to provide within the neighborhood unit nursery schools for 3- and 4-year olds, kindergartens for 5-year olds, and adult education in arts and crafts, as well as in the liberal arts. Although in general a neighborhood unit will have only one elementary school, in high density areas it may be necessary to build two or more. The analysis of this problem is dependent on how many students may be reasonably accommodated in a single school, what the maximum travelling distances to schools should be, and what population is needed to provide enough pupils for a separate school.

From the standpoint of convenience, safety, and economy, it is desirable that major streets constitute the boundary lines of the neighborhood units, and that the entire area within the bounds of major streets be considered as a balanced neighborhood. Within a sub-community, access should be had from one neighborhood unit to another, but the streets should be so designed as to discourage traffic through the sub-community and to confine traffic entering the sub-community to that activity necessary to maintain the neighborhood units as cells within a cell of a metropolitan plan.

Each neighborhood unit should be provided with its own local shopping center. This should take its place, along with the school and the social center, as a focal point of the neighborhood. It should be located so as to be convenient to the residents of the neighborhood, and business from outside the unit should be discouraged. Only such shops as are reasonably necessary for neighborhood convenience should be granted permission to do business. Ample provision should be made for off-street parking at the local shopping center, and the entire area should be proportioned to the population served. It should not be necessary for any of the residents of a neighborhood to enter the major thoroughfare systems to reach the local shopping center, school, community center, or recreation areas.

There should be within the neighborhood unit an adequate system of recreational facilities. It should be correlated to the school system and accessible from all homes without crossing heavily travelled streets. It should be so designed as to meet indoor and outdoor needs of young and old alike. Principal areas of green would include football and baseball fields, as well as minor facilities for the youngest children. Major recreational areas and facilities, such as large parks, golf courses, arboretums, swimming pools, and parkways should ordinarily be provided as cells within the structure of the sub-community, rather than within neighborhood units.

Summary

The neighborhood unit plan, as contrasted to the rotten stench of Atlanta's "black heart," may appear to be an idle dream. Certainly, if people in a position to affect the course of the growth

(Continued on Page 40)

Black Heart

(Continued from Page 38)

of Atlanta could think in terms of untenable goals, there might emerge from such dreams the growth of such a community.

Park, Burgess, and McKenzie, in their book entitled "The City," have said, "Where mobility is greatest and where in consequence primary controls break down completely, as in the zone of deterioration in the modern city, there develop areas of demoralization, of promiscuity, and of vice. It has been found that areas of mobility are also the regions in which are found juvenile delinquency, boys' gangs, crime, poverty, desertion, divorce, abandoned infants, and vice." Thus have the automobile and machine encumbrances of civilization made of a zone of mobility a zone of spiritual unrest. In order to avoid these evils, it is necessary to change the environment of family life so as to create neighborhood pride and spirit, promote healthy social interests, and thus, indirectly, contribute to the building up of a social responsibility on the part of all men.

To redevelop slum and blighted areas, at a great outlay of public and private funds, could not be justified were there any possibility that these areas could again become blighted. The neighborhood unit plan, however, is based on the principle of building from the outside in, a principle which is bound to provide great internal strength. This proposed development is at the same time conducive to building into the metropolitan plan protection, permanence, and structural flexibility to future changes. The choice becomes a resolution between two forces. Are we going to awaken to the moral challenge to our foresight, intelligence, and compassion for our fellow men? Or are we going to remain inert, causing the destruction of hope for freedom from want, freedom of religion, freedom from selfish government, freedom of speech, or freedom from fear?

I. HOUSING AND HOUSING NEEDS

HOMES ARE THE FOUNDATION OF A COMMUNITY.

A working-man spends one-third to two-thirds of his time there.
A housewife spends 2/3's to 19/20's of her time there.
A preschool child spends 2/3's to 19/20's of his time there.
A school child spends half to 3/4's of his time there.

More of a city's area is used for housing than for any other purpose.

Residential property contributes about half of a city's real-property tax income.

Services for residential areas (including schools) consume more than half of the community income from real-property tax income.

--Source for above data and statements: Introduction to Housing, Facts and Principles, by Edith Elmer Wood. U. S. Government Printing Office, Washington, 1940.

Studies of 22 cities show that the greatest amount of land area in urban communities is used for residential purposes. Streets and alleys take up the next highest amount of land, and then come industrial establishments, commercial enterprises, public and institutional buildings, and parks and open space, in order named.

--Source: National Housing Agency, Chart VIII-A, "Use Pattern of Developed Urban Land Areas." Statement of National Housing Administrator before the Senate Subcommittee on Housing and Urban Redevelopment, January 1945.

Housing constitutes approximately 40 percent of developed urban land area, 50 percent of assessed valuation of all urban property subject to local property taxation, 60 percent of total urban real property valuation. It provides 45 percent of local tax revenues, and 35 percent of total local revenues.

--Source: National Housing Agency, Chart VIII-C, "Housing in the Municipal Economy." Statement of National Housing Administrator before Senate Subcommittee on Housing and Urban Redevelopment, January 1945.

The cost of housing and household utilities is the second largest item in the consumer's budget. Only less important than food, it accounts for almost one-fifth of total consumption expenditures in the United States.

--Source: America's Needs and Resources. by J. Frederick Dewhurst and Associates. The Twentieth Century Fund, 1947.

The average person from 1930-39 spent 28.8 percent of his income on household rent and operation, composed of 15.4 percent rent and 13.4 percent operations, including utilities, fuel, purchase and repair of household furnishings, equipment, and supplies.

Household expenditures rank second in the consumer's budget of expenditures, less only than food and tobacco, which claim 30.3 percent of his income. Annual average expenditure from 1930-39 for household rent and operation totaled $17,143,000,000 for the Nation

--Source: Department of Commerce, quoted in National Housing Agency Chart VII-A, "Housing Expenditures." Statement of National Housing Administrator before Senate Subcommittee on Housing and Urban Redevelopment, January 1945.

Percent of income spent for housing, by income groups.

A Bureau of Labor Statistics survey in 1941 of urban families in 62 selected cities indicates that the portion of the family resources allocated for housing increases as the family income declines.

Measurement of housing costs against total family expenditures shows that the ratio increases steadily from 21.3 percent for the $2,500-$3,000 income group to 33.7 percent for the group with incomes under $500. When housing expenditures are measured against family income, the ratio increases from 20.0 percent to 42.5 percent.

The fact that housing expenses loom so large in the budgets of low income families has this significance: It indicates that the general hardships of these low income families may be due not only to the inadequacy of income per se, but also to the fact that there is a channeling of an excessive portion of their income to housing at the sacrifice of other necessities. This suggests that many of our low income families who have been treated as "relief problems" should rather be treated as housing problems. It follows, also, that there would be little net advantage in a program furnishing low income groups with

better housing if it resulted in higher cost to them. The obvious reason for this is that an increase in the cost of housing would result in additional strictures upon other necessities...the reduction of housing costs is a primary requisite for an effective postwar housing program.

--Source: Statement of National Housing Administrator, before Senate Subcommittee on Housing and Urban Redevelopment, January 1945.

NEED FOR HOUSING

Estimates of post-war housing needs range from under a million to well over a million and a half units per year, for at least ten years. Some of these estimates are:

Housing and Home Finance Agency

1.	Estimated 1960 families according to Bureau of Census	39,500,000	
2.	Allowance of 4 percent effective vacancies (i.e. units actually for rent or sale and habitable year round)	1,600,000	
3.	Total dwelling units needed in 1960	41,100,000	
4.	Subtract: Effective inventory as of April 1947	32,729,000	
5.	Number of additional units needed from beginning of 1947	8,371,000	
6.	Subtract: Units added to supply in 1947 and 1948	2,100,000	
7.	Net additional number needed between 1948 and 1960 to bring requirements and supply into balance.....		6,271,000
	Add:		
8.	For replacement of estimated loses from 1947 to 1960 (fire, demolition, floods, etc.)	520,000	

9. For rehabilitation or replacement of substandard units equivalent to nonfarm units in need of major repairs and of urban units lacking private bath and toilet	5,600,000	
10. For rehabilitation or replacement of substandard units in surrounding suburban areas and for rehabilitation or replacement of standard units deteriorating by 1960	2,000,000	
11. For replacement of temporary structures	350,000	
12. Total rehabilitation and replacement, to 1960		8,470,000
13. Total nonfarm requirements to 1960		14,741,000
Add:		
14. Rehabilitation or new construction of farm housing	2,000,000- 3,000,000	
15. TOTAL U. S. housing requirements	16,741,000-17,741,000	
Annual averages		
Nonfarm	1,340,000	
Farm	182,000 - 273,000	
Total	1,522,000-1,613,000	

--Source: Estimated Future Housing Requirements of the U. S., prepared by the Housing and Home Finance Agency, Washington, 1948.

Senate Banking and Currency Committee

There is an estimated need for an average rate of homebuilding over the next 12 years of about 1,500,000 dwelling units a year, including nonfarm and farm.

--Source: Report, Senate Committee on Banking and Currency, accompanying S.1070, Housing Act of 1949, 81st Congress.

Joint Congressional Committee on Housing

Housing production (both farm and nonfarm) over the next 12 years should average at least 1,500,000 units a year and should well exceed that figure in many years. Of the total, it is estimated that not less than 1,285,000 should be nonfarm units. Estimates of the rural housing job call for between 200,000 and 300,000 units a year for at least a decade.

--Source: Housing Study and Investigation. Final Majority Report of the Joint Committee on Housing, 80th Congress, March 15, 1948.

Council of Economic Advisers

Estimates of the peoples' housing needs, including the rural areas, range up to a million and a half or even more units per year on an average over the next 10 years.

--Source: Council of Economic Advisers. Second Annual Report to the President, December 1947.

National Public Housing Conference
National Association of Housing Officials

1,500,000 homes are required annually from 1948 through 1960.

--Source: A Housing Program for Now and Later. Published by the National Public Housing Conference, Washington, February 1948.

Twentieth Century Fund

To bring all housing (urban and rural) up to standard during the 15-year period from 1946 to 1960 and also provide for new families, we would have to build a total of 19,678,000 new units and rehabilitate 5,438,000 units--an annual average for 15 years of 1,312,000 new and 363,000 rehabilitated units.

--Source: America's Needs and Resources, by J. Frederick Dewhurst and Associates. The Twentieth Century Fund, 1947.

Earlier estimates that have been generally supported by the U. S. Census Bureau's April 1947 surveys are:

National Housing Agency, 1944.

A 10-year need for construction of 12,600,000 nonfarm dwelling units, or 1,260,000 per year, based on assumption that we will replace only half of our existing backlog of substandard housing. If the entire substandard group were to be replaced in the 10-year period, the need would be 16,100,000 units in 10 years or 1,610,000 per year.

The 12,600,000 estimate includes:

6,300,000 units for net increase in new urban families in 10 years after the war. 6,100,000 to replace substandard units; this is one-half of existing substandard units and of those that will become substandard during the period, or their equivalent. 200,000 units to be replaced for units destroyed by fire, storm, and flood.

--Source: Housing Needs, A Preliminary Estimate. National Housing Agency Bulletin #1, 1944, Washington.

Twentieth Century Fund, 1944.

Well over a million new dwellings a year. Majority should be medium priced and low-priced, from under $2,000 to $4,000. A large part needed for rent rather than sale.

--Source: American Housing: Problems and Prospects. The Twentieth Century Fund, 1944.

Congress of Industrial Organizations, 1943.

Average of at least 1,500,000 homes per year for 10 to 20 years.

--Source: Good Shelter for Everyone. Research and Education Department, CIO, Washington.

American Federation of Labor, 1945.

Aggregate of 15,600,000 dwelling units for ten-year period after the war, averaged per year at 1,500,000.

--Source: Testimony before the Senate Subcommittee on Housing and Urban Redevelopment, January 1945, AFofL, Washington.

Producers' Council, 1943.

An annual average construction of 972,000 dwelling units in the five years from 1947-1951.

F. W. Dodge Corporation, 1943.

820,000 units a year in the first post-war decade.

--Source: T. S. Holden, F. W. Dodge Corporation. Quoted from the Architectural Record, September 1943.

CONDITION OF HOUSING

The latest comprehensive figures on the supply and condition of housing is the sample surveys made by the Bureau of the Census in April 1947. The following references are based on this data:

In April 1947 there were 41,625,000 dwelling places in the U. S. ranging all the way from 40-room mansions to 1-room shacks. The 34,133,000 nonfarm dwellings of this total represented the highest proportion of such units in U. S. history. The rural farm dwellings numbered 7,492,000.

--Source: The Housing Situation - the factual background. Housing and Home Finance Agency, June 1948.

In 1947, nonfarm units needing major repairs and units in urban areas lacking private inside bath and toilet numbered close to 5,200,000. These two categories constitute the number of dwelling units that are substandard and require replacement.

In addition, replacement will be required by 1960 of 2,000,000 deteriorated and substandard units in suburban areas and 350,000 temporary structures.

--Source: Housing Study and Investigation, Final Majority Report, Joint Committee on Housing, 80th Congress, March 15, 1948.

In April 1947, 67.3 percent of rural farm dwellings lacked running water; only 20 percent had private bath and flush toilet; about 60 percent had electric lights; 10 percent were overcrowded. Only 19 percent of farm dwellings were provided with modern facilities, such as lights, running water, bath, and flush toilet.

--Source: Raymond C. Smith, Assistant Chief, Bureau of Agricultural Economics, Dept. of Agriculture. Hearings, Senate Committee on Banking and Currency, 81st Congress, February 1949.

Overcrowding

In 1947, 2,400,000 dwelling units were overcrowded with over 1.5 persons per room. This was a decline of about 3 percent in overcrowding as compared with 1940. But to the extent that the 1,900,000 increase in the number of 2-person families between 1940 and 1947 represents recently married couples who have not begun to rear children, the proportion of overcrowded units may well rise again as these new families increase in size.

--Source: The Housing Situation - the factual background. Housing and Home Finance Agency, June 1948.

Doubling

The number of married couples living with other families has risen from about 1,435,000 in 1930 and 1,846,000 in 1940 to 2,712,000 in 1947. This means that doubled families now equal 6.9 percent of all households compared with 5.3 percent in 1940 and 4.8 percent in 1930. In addition to those living doubled with other families there were in 1947 some 149,000 normal families living in quasi-households, institutions, rooming houses, transient hotels, etc. -- compared with only 100,000 in 1940.

All told there were, in April 1947, nearly 2,900,000 married couples who lacked separate homes of their own, an increase of nearly 1,000,000 over the 1,950,000 such families in 1940

--Source: The Housing Situation - the factual background. Housing and Home Finance Agency, June 1948.

The last complete housing census was that of 1940, conducted by the Bureau of the Census. Very important changes in the housing figures have taken place since that time, but the following estimates of need, based on the 1940 figures, are included for reference purposes:

Of the 37 million dwelling units in the U. S. in 1940, it is estimated that 16 million needed to be either replaced or rehabilitated. Almost a fifth of all units needed major repairs; about 30 percent lacked running water; 40 percent lacked a private toilet; about 45 percent lacked a private bath or shower.

--Source: America's Needs and Resources. By J. Frederick Dewhurst and Associates. The Twentieth Century Fund, 1947.

In 1939, of the 21,600,000 urban dwellings, 6,200,000 or 28.6 percent were substandard by reason of needing major repairs or of lacking in modern plumbing facilities (private bath or toilet).

Of the 6,200,000 substandard urban units, 2,600,000 were in need of major repairs, the continued neglect of which would make them a hazard to safety; 1,400,000 had no running water in the house; 3,750,000 were without indoor toilets, and 5,000,000 had no private bath. Thus, many of the substandard units were defective in more than one respect.

--Source: 1940 U. S. Housing Census

Of the urban housing in 1940, 1,200,000 or 5.7 percent had more than 1.5 persons per room, a serious stage of overcrowding.

Approximately 7 million nonfarm units are believed to have been substandard in 1940 and in need of replacement.

--Source: Housing Needs, A Preliminary Estimate. National Housing Agency Bulletin #1, 1944.

Nearly 4 million nonfarm units need major repairs and over 6 1/2 million more lack running water or private indoor sanitary and bathing facilities. On the farm, conditions are relatively much worse. Of the 7,600,000 farm dwellings, nearly 2,500,000 need major repairs, and over 3,700,000 more lack any sort of indoor water supply.

--Source: Report to the Special Committee on Postwar Economic Policy and Planning by the Subcommittee on Housing and Urban Redevelopment, August 1, 1945.

Of more than 8,600,000 rural nonfarm dwellings, 5,150,000 or 63.9 percent were in need of major repairs or lacked plumbing facilities.

--Source: 1940 U. S. Housing Census

Of more than 7,600,000 rural farm dwellings over 6,900,000, or 90 percent, needed major repairs or lacked modern plumbing facilities such as baths or toilets, or running water in the house.

--Source: 1940 U. S. Housing Census

"Circles of Rot"

Because of the lack of good housing for the poorer groups, the pattern of American cities through the years has become one of progressive housing rot, usually beginning at the very heart of the city, which is the older part, and spreading through lessening degrees of decay to the expanding outer rim or suburbs where good housing has fled. High land values and taxes on the slum property have resulted in continued failure to maintain and repair the old houses, in exorbitant rents for insanitary and inadequate quarters, and in over-crowded dwellings by families unable to afford enough space to live in.

--Source: "Decline of Central Cities," pages 16-17, American Housing: Problems and Prospects. The Twentieth Century Fund, 1944.

A map of Denver's housing illustrates this point. At the center the map shows 60 percent or more of the housing substandard. Around the center is the area that is between 40 percent and 60 percent substandard. Moving out, one comes to the area of housing that is between 20 percent and 40 percent substandard. And on the fringes is the area with housing that is under 20 percent substandard. Another map, of San Francisco, also illustrates "circles of rot."

--Source: Map from Housing in Denver. Vol. 17, No. 1, University of Denver Reports, June 1941. Published by the Bureau of Business and Social Research and the School of Commerce, Accounts and Finance, University of Denver, Col.

--Source: "Conditions of Residential structures in San Francisco," Map reproduced in San Francisco's Housing, published by the Housing Authority of the City and County of San Francisco, May 1941.

The neighborhood near the business center of the city, the neighborhood which has seen better days and which originally contained residences of good type, is today the best known type of slum. As business crept in and changed its character; as original residents moved further from the center in search of space, quiet, and gardens; as single family houses were split up into apartments or became rooming houses, as buildings or parts of buildings became converted to office or shop use; the neighborhood deteriorated and people who could afford to do so moved out.

--Source: Slums and Blighted Areas in the United States, by Edith Elmer Wood. U. S. Government Printing Office, 1938.

WHO NEEDS HOUSING?

In the spring of 1947 there were 2,800,000 families living doubled up with other families, the vast majority because of acute housing shortage. An additional 500,000 families were living in temporary housing, trailers, rooming houses, and other makeshift accommodations. Moreover, in 1946, even with the sharp expansion of home building, the net number of new families formed greatly exceeded new homes built. Finally, a very substantial proportion of the existing housing supply is far below minimum standards of decency.

--Source: Housing Study and Investigation. Final Majority Report of the Joint Committee on Housing, 80th Congress, March 15, 1948.

The bulk of demand in the 15-year period 1946-1960 it is estimated will be for houses costing slightly more than $3800 at 1940 prices.

--Source: America's Needs and Resources, by J. Frederick Dewhurst and Associates. The Twentieth Century Fund, 1947.

Nonfarm housing needs over the next ten years require 12,600,000 units of new construction as follows, based upon 1940 price levels:

1. About 3,600,000 units, about 28 percent of the total, will be needed at monthly charges of less than $20;

2. Above 4,800,000 units, about 38 percent of the total, will be needed at monthly charges between $20 and $40;

3. Above 4,200,000 units, about 34 percent of the total, will be needed at monthly charges above $40.

--Source: Hearings on S.1592. Committee on Banking and Currency, U. S. House of Representatives, July 1946. Statement by National Housing Administrator and Expediter.

Needs of Minority Groups

One-fourth of nonfarm dwelling units occupied by nonwhites were in need of major repairs in 1947; 36 percent were without essential plumbing facilities.

The proportion of nonfarm dwelling units occupied by nonwhites which were substandard (needed major repairs or lacked essential plumbing facilities) was almost six times as high as that for whites. Overcrowding among nonwhites was over four times as great as for whites.

--Source: Housing of the Nonwhite Population (figures from U. S. Bureau of the Census, April 1947). Housing and Home Finance Agency, Washington, June 1948.

About 55 percent of married Negro veterans in the South and 45 percent in the North were living doubled-up or in rented rooms or trailers. Furthermore, about 37 percent of Negro veterans in the South and about 29 percent in the North were living in dwellings needing major repairs or lacking one or more standard plumbing facilities.

Negro veterans were able to pay on the average monthly rents of $31 in the South and $39 in the North.

--Source: The Housing of Negro Veterans. Housing and Home Finance Agency, Washington, January 1948.

VETERANS' NEEDS

35 percent of married veterans (in 108 areas surveyed by the Census Bureau July 1946 to January 1947) were living doubled-up or in rented rooms, trailers, or tourist cabins. One-tenth of all veterans (excluding roomers) in the surveyed areas were living in housing needing major repairs or lacking proper bathing or toilet facilities.

Among veterans who desire to own homes, 10 percent can afford to pay less than $4,000; 10 percent can afford $4,000 to $5,000; 22 percent can afford $5,000 to $6,000; 21 percent: $6,000 to $7,000; and 37 percent can afford to pay over $7,000.

Veterans desiring to rent homes are able to pay: less than $30 per month for rent and utilities, 8 percent; $30 to $39, 26 percent; $40 to $49, 36 percent; $50 to $59, 19 percent; $60 and over, 11 percent.

Incomes of veterans surveyed averaged $46 weekly; incomes of 3 percent averaged less than $20 weekly; 28 percent had incomes averaging between $20 and $39; 46 percent had incomes averaging $40 to $59; and 19 percent had average weekly incomes of $60 and over.

--Source: Veterans' Housing Plans and Living Arrangements in 1946, For 108 survey areas. Statistics Bulletin #2, January 1948. Housing and Home Finance Agency, Washington.

Among Veterans who desire to own their homes, 14 percent felt they could afford to pay more than $50 a month, 54 percent felt they could afford to pay between $30 and $50 a month, and 32 percent felt they could afford to pay only $30 a month or less.

Among veterans who desire to rent houses, 11 percent felt they could afford to pay more than $50 a month, 55 percent felt they could afford to pay between $30 and $50 a month, and 34 percent felt they could afford to pay only $30 a month or less.

--Source: War Department Survey of Separation Centers, December 1945.

Our present housing problem is of long standing. While developments attributable to World War II have contributed to the intensity of our present problem, the current shortage actually has been accumulating over a long period of years when the volume of new housing construction was less than the net increase in new families.

--Source: Housing Study and Investigation. Final Majority Report, Joint Committee on Housing, March 15, 1948, 80th Congress.

HOUSING POLICY

"...The importance of a well conceived comprehensive housing policy cannot be exaggerated. There is no problem before the American people with more varied aspects than that of housing, each of them important to the future welfare of the country.

"From the social point of view, a supply of good housing, sufficient to meet the needs of all families, is essential to a sound and stable democracy. Every family must have a decent home in which to live. The character of that home determines more than anything else the character of family life, the conditions in which children grow up, and the attitude of the people toward the community and the Government..."

"...Slums have inevitably grown up in all our cities and in our towns and in the open country-side; and overcrowding and makeshift alteration have necessarily been utilized to balance our shortcomings.

"We can no longer accept these conditions as unavoidable. We cannot safely face the difficult undertakings of the years ahead, with the burden of hardship and discontent that bad housing imposes upon us. The issue must be faced and the task assumed. It is a task which cannot be performed in one year, nor perhaps a decade, but one which as a nation we must devotedly pursue and accomplish as rapidly as proper use of our resources permits."

--Source: Report of the Subcommittee on Housing and Urban Redevelopment, U. S. Senate, August 1945.

"Housing is of sufficient importance to the economic and social welfare of the American people as a whole as to justify and require effective Federal action to help improve housing conditions...the Federal Government should join with industry, labor, and State and local governments in policies aimed at eventual achievement of a decent home and a suitable living environment for all families--the essential foundation for any national housing policy."

--Source: Housing Study and Investigation. Final Majority Report of the Joint Committee on Housing, 80th Congress, March 15, 1948.

"...The general welfare and security of the Nation requires the realization as soon as feasible of the goal of a decent home and a suitable living environment for every American family. In our advance toward that goal, the policy declaration (in Senate Bill 1070) recognizes the necessity of attaining a rate of housing production sufficient to overcome the serious housing shortage and to replace slums and other inadequate housing..."

--Source: Report, Committee on Banking and Currency (to accompany Senate Bill 1070, to establish a national housing objective and policy). U. S. Senate, February 1949.

"...Some of the (housing) programs of strictly emergency or experimental character have been discontinued and have been or are being liquidated. But from a considerable part of this legislation have emerged permanent programs which have been continually revised and improved by the Congress to serve changing needs. These include a system of aids to home financing institutions which is administered by the Home Loan Bank Board; the credit insurance programs of the Federal Housing Administration; and the low-rent public housing program administered by the Public Housing Administration.

"Underlying the development of these programs, as well as the establishment of several emergency programs, has been the implied recognition that the well-being and security of the home are matters of national public policy, and that the stability of the home-building industry is essential to the health of the economy..."

--Source: Report, Committee on Banking and Currency, to accompany H.R. 4009 (Housing Act of 1949), House of Representatives, May 16, 1949.

II. ECONOMIC AND SOCIAL COSTS OF GOOD AND BAD HOUSING

GOOD HOUSING COSTS MONEY--majority built for higher income groups

"...Incomes of the American family...in the last analysis determine what kind of houses these people can afford either to buy or to rent..."

--Source: Dr. Isador Lubin, Commissioner of Labor Statistics, U. S. Department of Labor. Hearings, Temporary National Economic Committee, 1939 (P.4949, Part II, Construction Industry).

During 1938, the Bureau of Labor Statistics testified, 1/10th of one percent of the new nonfarm dwellings built were within the means of the 37 percent of families with incomes under $1,000.

3.7 percent of dwellings built were within the means of the 24 percent of families with incomes between $1,000-$1,500.

15 percent of dwellings built were within the means of the 18 percent of families in the income group between $1,500-$2,000.

In summary: only 19 percent of the new housing built in 1938 was available to the 76 percent of nonfarm families having incomes of less than $2,000, while 81 percent were built for families with incomes of $2,000 or more. In other words, the number of dwellings built was in inverse ratio to the number of families in each income group.

--Source: Monograph #8 - Toward More Housing. Temporary National Economic Committee, 1940.

The reports of the Bureau of the Census show that 19.7 percent of urban families had money incomes in 1947 of less than $2,000, while 30.3 percent had incomes of less than $2,500. On the accepted basis of paying one-fifth of their incomes for housing, the average rent which the urban families in this lowest 30 percent income group can afford to pay would be approximately $27 per month, including heat and all other utilities.

"If the families now living in the slums are to be provided with decent homes, it is, therefore, evident that a large additional supply of housing must be provided at rents which will average somewhat under $30 per month, including all utilities."

--Source: Report, Committee on Banking and Currency, to accompany S.1070 (A Bill to Establish a National Housing Objective and Policy). U. S. Senate, February 1949.

Charts showing lack of home construction for families in low income brackets:

Seven Myths of Housing, by Nathan Straus.

Chart page 10, comparing urban income groups with percent of private housing and with percent of public housing provided.

Chart page 107, comparing numbers of families by income to amount of housing built, 1941. Within the means of 10 million families with annual incomes under $1,500, 500,000 new urban dwellings were built in the decade from 1930 to 1940.

Introduction to Housing, by Edith Elmer Wood.

Chart page 90, comparing number of families by income groups and housing built, from data for 28 cities, 1939.

Within the means of 3,800,000 families in 28 cities with annual incomes under $1500, 40,000 new dwellings were built between 1929 and 1935.

Housing Costs, National Housing Agency Bulletin #2, 1944.

Appendix A, part 2. Table showing for 1941 the percent of FHA Title II borrowers compared to number of families in various income groups. FHA insured mortgage loans represent housing of acceptable standards, so that comparison reflects provision of adequate housing compared to income need. Table shows that the income groups of less than $1,500, accounting for 41 percent of nonfarm families, represented only 8 percent of FHA Title II borrowers.

National Housing Agency, Chart XIII-A1, "Annual Average Nonfarm Dwelling Units Needed, 1946-1955." By monthly rentals, compared with dwelling units started.

In 1947 most of the housing built was for families in the higher income brackets. To the extent that low and middle income families were served, high cost placed an excessive financial strain upon them.

Only a small minority of families can afford to purchase new houses of satisfactory size and quality.

--Source: The Economic Report of the President to the Congress, January 1948.

BAD HOUSING COSTS MORE

The cost of slums to the taxpayer has been measured in dollars and cents.

In Boston, where the City Planning Board made a study in 1935, it was discovered that the per capita deficit to the city from a slum area was $48.24; from all other residential areas the average deficit was $10.81.

In Indianapolis, Indiana, the average per capita cost of services to a slum area was $61.85 compared to $38.56 per capita for the city as a whole.

In Cleveland it was found that the per capita cost of operating a slum area was $61.22. The deficit here was $51.10 per capita.

National Housing Agency Chart VIII-E-1, "Municipal Expenditures in Slum Areas, Cleveland and Indianapolis."

National Housing Agency Chart VIII-D, "City Revenues and Expenditures for Various Types of Housing Areas (based on city-wide survey, Boston 1935)."

In Birmingham, Alabama, municipal expenditures in 22 blighted areas were 3 times the income from these areas. In 4 good areas the expenditures were 5/6's of income.

In Atlanta, Georgia, slum areas contributed 5 1/2 percent of the city's real property tax revenues, but cost 53 percent of the city's police, fire, health, and other service costs.

In Philadelphia, Pennsylvania, the per capita cost of crime in a typical slum area was $14.56, compared with $5.36 on a city-wide basis.

--Source: National Housing Agency Chart VIII-E-2, "Municipal Expenditures in Slum Areas."

A municipal income-and-expense study in Buffalo, based on a report of the Department of Audit and Control for 1933, showed the following comparison of average annual cost per family between the city-as-a-whole and slum areas:

	City as a whole	Slum area
Police Protection	$19.19	$27.16
Fire Protection	15.40	35.79
Juvenile Delinquency	.25	.60
Public Health Services	15.52	52.56
Public Welfare Services	89.50	224.01

--Source: 10 Years of Progress, 1934-1944. Buffalo (New York) Municipal Housing Authority.

City services (fire, police, health, welfare, and juvenile court) to the decayed Geary-Fillmore district cost $741,315; to the clean, bright Marina district (comparable in size and population) city services cost $86,659.

--Source: Blight and Taxes. A study contrasting two neighborhoods. San Francisco Planning and Housing Association, November 1947.

A comparative study in 1945 of a blighted area in Boyle Heights and a good housing area in the West Adams district clearly indicated that the blighted areas are subsidized by the rest of the city. Whereas the per capita real property tax revenue from the Boyle Heights area was $4.25 annually, the per capita cost to the city for just supplying fire, police, health, and recreation services amounted to $7.00. This was in direct contrast to the per capita real property tax revenue of $11.30 and a per capita cost of $3.67 for the same four municipal services in the West Adams district. Rough estimates indicate the Los Angeles taxpayers are subsidizing the Boyle Heights area alone to the extent of approximately $288,000 annually.

--Source: Los Angeles City Planning Commission, Los Angeles, California

The net cost of Newark's slums each year is over $14,000,000.

The "normal" municipal cost of maintaining a dwelling of minimum safety and comfort in a fairly good neighborhood is approximately $150. The municipal cost of maintaining a slum dwelling is $380. The difference of $230 would be the municipal cost per dwelling attributable to the slum conditions, or the "excess cost" of a slum dwelling.

--Source: The Cost of Slums in Newark, a study by Dr. Jay Rumney and Sara Shuman. Published by the Newark (N.J.) Housing Authority, 1946.

Part of the high cost of slum and blighted areas is the high tax delinquency. In St. Louis, delinquency in slum areas ranged from 25 to 40 percent as against 2 to 5 percent in newer residential districts. In Cincinnati, Milwaukee, Detroit, and Peoria tax delinquency and blight were closely related. Cleveland; Cambridge, Massachusetts; and New York City show the same pattern.

--Source: "(Tax) Delinquency in Slum Areas," American Housing: Problems and Prospects. The Twentieth Century Fund, 1944.

Thirteen primarily residential areas in Manhattan contained almost 1/2 of all the properties in Manhattan which had been tax delinquent for more than 3 years, although the areas themselves constituted less than 1/5th of Manhattan's area and contained only about 1/3 of the number of its (land) parcels.

In dollars and cents, tax delinquencies in the 13 areas, measured on a percentage basis, were 2 1/2 times as serious as in the remainder of Manhattan.

Tax dollar delinquency in the thirteen blighted areas was approximately double that of non-blighted residential areas.

The taxes which these thirteen blighted areas should bear but fail to pay are borne by healthy real estate elsewhere.

--Source: Ailing City Areas. Economic Study of Thirteen Depressed Districts in Manhattan. Citizens' Housing Council of New York, May 1941.

Substandard housing areas constitute pernicious environments for the young, and, while contributing little to the tax income of the municipality, consume an excessive proportion of its revenues because of the extra services required for police, fire, and other forms of protection.

--Source: Supreme Court of Pennsylvania, Eastern District, January Term, 1947. Opinion of the Court, upholding constitutionality of public action to clear and reconstruct slums.

SOCIAL EFFECTS OF BAD HOUSING

Areas of bad housing and high rates of disease, delinquency, and crime coincide.

Tuberculosis is shown to be most prevalent in overcrowded homes. Highest rates of digestive diseases are found in homes without private inside flush toilet. Home accidents are most numerous in homes renting for less than $10 monthly. Common communicable diseases of childhood are most frequent in homes with more than 1.5 persons per room.

--Source: NHA Chart VIII-H, "Relationship of Housing Conditions to Health," based on National Health Survey, 1935-1936, U. S. Public Health Service.

"New Light on Relationship of Housing to Health", by Rollo H. Britten. American Journal of Public Health, February 1942.

Infant mortality rate is higher in overcrowded homes. Figures from eight cities show that the infant mortality rate in families averaging less than one person per room was 52 per 1,000 live births. Where the room density was between 1 and 2, the rate was 94.9, and for 2 persons per room and over, it was 135.7. With adjustment for income and race, it was found that the infant mortality rate in congested homes was still about twice as high as in homes where there was enough space.

--Source: "Casual Factors in Infant Mortality," 1925. Quoted in Slums and Blighted Areas in the U. S., by Edith Elmer Wood. Government Printing Office, 1938.

Pneumonia and tuberculosis mortality rates in the Basin slum area for 1939-41 were significantly greater than in the rest of the city. For the white population, Basin dwellers died from tuberculosis at nearly 3 times the rate for those living outside that area; from pneumonia at almost 2 1/2 times the rate. Infant mortality was twice as high in the Basin as it was for the rest of the city. Cincinnati's 1939-41 death rate would have been about 15 percent lower had it not been for the excessive mortality in the Basin area.

"These studies have shown beyond peradventure of doubt that a decidely unequal chance for life exists in different sections of the city. There is a striking contrast in survival between life in the slums and life on the hilltops. For want of healthful surroundings slum dwellers in the Basin suffer a terrific penalty in needless sickness and needless deaths. Compared with the mortality experience of hilltop people, infant mortality and deaths from tuberculosis and pneumonia in the Basin are indeed excessive."

--Source: A Story of Life and Death in Cincinnati, as revealed by the Mortality Studies of Floyd P. Allen, M.D. Published by the Public Health Federation, Cincinnati, Ohio, October 1947.

"Bad housing, as a matter of practical fact, is profoundly detrimental to health; and the existence of the slum is a health problem of outstanding significance."

--Source: Dr. C. E. A. Winslow, American Public Health Association. Quoted from "Housing and Health." journal of Public Health Nursing, July 1940.

"...The provision of a satisfactory supply of housing is essential to public health progress...the quality of housing bears a distinct relation to the health of the people...there is a wealth of evidence that certain elements in housing contribute to the occurrence of communicable disease and to other ailments...studies point to substandard housing as a contributor to ill health...improving the quality of housing is a necessary adjunct to the provision of better health services..."

--Source: Leonard A. Scheele, Surgeon General U. S. Public Health Service. Hearings, Committee on Banking and Currency, U. S. Senate, 81st Congress, February 1949.

Another major contributing factor to juvenile delinquency is the shortage of good low-cost and low-rent housing. It compels families to crowd up and to occupy inadequate houses because no better accommodations are available to them. It forces the occupancy of housing units which have deteriorated beyond repair and should long since have been replaced.

"...The cumulative housing shortage...has been accompanied by an alarming increase in the break-up of family life and the increase in juvenile delinquency."

"...The most influential character-guiding force in the life of the child is his relationship with his parents. That relationship is conditioned by the physical and environmental surroundings of home and neighborhood. A family lost in the slums and blighted area of a metropolitan center or the inadequate housing and community facilities of a depressed rural section finds itself victimized by anti-social forces beyond its control..."

"The correlation between unsatisfactory and inadequate housing and juvenile delinquency is clearly established.

Good housing affords an environment within the home where each member of the family can enjoy privacy and where the surroundings facilitate growth."

--Source: Report on Housing, Community Development and Juvenile Delinquency. National Conference for the Prevention and Control of Juvenile Delinquency, November 1946. Department of Justice, Washington.

School truants, juvenile delinquents, and adult offenders tend to be concentrated in slum areas. From 1900, Chicago areas studied showed several changes in racial makeup of the population, but rates of delinquency continued high throughout. Thus one-fourth of all juvenile delinquents came from 10.9 percent of the juvenile population crowded into 6 percent of the city area. Concentration of people in the slum neighborhoods is more than twice the average for the city, and the concentration of truancy among inhabitants is 2 1/2 times the city average.

--Source: Slums and Blighted Areas in the U.S., by Edith Elmer Wood, quoting Delinquency Areas, a study of the geographic distribution of school truants, juvenile delinquents, and adult offenders in Chicago, by Dr. Clifford B. Shaw, 1929.

Chicago study results are paralleled in studies of other cities, where the relationship between concentration of population on the land and high delinquency rates among the concentrated population have been shown as follows:

City	Percent of city delinquency	Percent of juvenile population	Percent of city area
Chicago.....	25	10.9	6
Philadelphia.....	46	25.1	9.4
Cleveland.....	47.4	26.3	17.3
Birmingham.....	25	12.2	12.1
Richmond.....	50	31	18.8
Denver.....	25	11	5.7
Seattle.....	25	11.2	6.3

--Source: Slums and Blighted Areas in the U. S., by Edith Elmer Wood, quoting from volume II, Causes and Cure of Crime, Wickersham Report, 1931.

Approximately 60 percent of the cases of juvenile delinquency in this city comes from a district comprising about one-third of the city's area. In one area of bad housing in this district juvenile delinquency is nine times as great as in a good housing area of similar size in another district.

--Source: James A. McDonald, Probation Officer, Wichita Falls, Texas. Statement to the Joint Congressional Committee on Housing, 80th Congress, March 1948.

Of 1693 juvenile arrests in the Los Angeles central area during 1947, more than 70 percent occurred in the district bounded by Figueroax Street, Sixth Street, and the River, a section with the poorest housing conditions and highest population density in Los Angeles. In contrast, West Los Angeles and the San Fernando Valley, where space abounds, are areas of little juvenile delinquency.

--Source: Mrs. Curtis Albro, Police Commissioner, City of Los Angeles. (Reported in the L. A. Housing News, May 1948.)

In Detroit, Michigan, a Housing Commission survey showed that the pneumonia death rate in a slum area was 3 times the rate in a normal residential area; crimes were 5 times as numerous; infant mortality 6 times as great; the tuberculosis death rate 10 1/2 times as great, and criminals were 15 times more numerous than in normal residential areas.

In Cleveland, Ohio, a slum area containing 2.47 of the city's population, had, of the city's total, 4 percent of the larcenies, 5.7 percent of the robberies; 7.8 percent of the juvenile delinquencies, 10.4 percent of the illegitimate births; and 21.3 percent of the murders.

--Sources: NHA Chart VIII-G, "Social Aspects of Slum Areas." Quoted from: Report of City of Detroit Housing Commission; R. B. Navin's Analysis of a Slum Area in Cleveland.

"A comparison of housing maps...with the delinquency rate maps shows that inadequate housing exists much more frequently in the areas of high delinquency. The heavily shaded areas of the delinquency maps correspond closely to the heavily shaded areas of the housing maps. Conversely, those which have the fewest delinquents also have the fewest substandard dwellings.

"In the five tracts of highest delinquency, 65.6 percent of the occupied dwelling units needed major repairs or had no private bath, as compared with 3.9 percent of occupied dwelling units in the five tracts of lowest delinquency. Likewise, the five tracts of highest delinquency had overcrowding in 28.5 percent of their dwelling units, in contrast with 3.3 percent in the five tracts of lowest delinquency..."

POOR HOUSING BLIGHTS YOUTH, FIGURES SHOW
BLIGHT RAISES PRISON COSTS
BLIGHT ZOOMS PRISON COSTS: RECORDS IN CITY CITED.

--Source: Headlines on articles by Richard S. Davis, in Milwaukee Journal (Wisconsin), April 26, May 12, and June 2, 1946, based on city records of crime and juvenile delinquency, showing that one blighted ward cost taxpayers nearly $150,000 in 1945 for prison inmates.

Slum areas in the District of Columbia show Army rejection rates for personality disorders 1 1/2 times as great as in areas with good housing, according to a sample study of records of 5,800 men examined at Fort Myer, Virginia, during a 2-year period ending May 1944.

--Source: E. E. Hadley, "Military Psychiatry," an ecological note. Published in Psychiatry, November 1944.

A slum area of less than three square miles (the Fifth Police District) with about 300,000 inhabitants crowded into it, in 1945 produced more than 21 percent of Chicago's murders, 12.3 percent of all robberies, and 24.9 percent of all rape offenses. Furthermore, the years 1944 and 1943 showed substantially the same statistics.

A principal factor in the high crime rate in the Fifth Police District is the inadequate housing situation that prevails there. From the observation of Chicago Crime Commission investigators and through interviews with numerous representative citizens the conclusion is inescapable that undesirable living conditions in this area contribute materially to a high incidence of criminality.

--Source: "Crime Conditions in Fifth Police District," by Virgil W. Peterson, Operating Director, Chicago Crime Commission. Published in Criminal Justice, May 1946.

SOCIAL EFFECTS OF REHOUSING

"No program to strengthen the foundations of family life can overlook the influence of housing, the basic environment of domestic life."

--Source: National Conference on Family Life. Report of Housing Committee, May 1948.

Study under the auspices of the Newark (New Jersey) Housing Authority shows decrease in public housing projects of children's communicable diseases, infant mortality, tuberculosis, fatal home accidents, juvenile delinquency, and fires, as compared with areas of substandard housing. Conducted by Dr. Jay Rumney, Professor of Sociology, University of Newark, the study compared records of tenants in three representative projects of the housing authority with records of the population of three areas of substandard housing typical of those from which public housing draws its tenants. The study was conducted over a two-year period, 1942 and 1943. It reports the following:

	Public Housing	Three Slum Wards
Tuberculosis: New cases per 1,000 in age group 15-40.....	3.3	6
Infant deaths per 1,000 births....	34.7	40.6
Children's communicable diseases (whooping cough, measles, scarlet fever, chicken-pox German measles, mumps) per 1,000 children under 15.....	114.2	163.5
Birth rate per 1,000 women 15-40.....	118.5	86.2
Delinquents on probation per 1,000 juveniles aged 10-17.....	11	14
Fire per 1,000 persons.....	.79	2.93
Cost of fire runs at $100 each per 1,000 dwellings.....	$295	$1,115
Fatal home accidents per 10,000 persons.....	0	25

In percentages, the statistics show that the public housing projects had:

45% fewer cases of tuberculosis
15% fewer infant deaths
31% fewer cases of children's diseases
37% more births
21% fewer cases of juvenile delinquency
74% fewer fires
100% fewer deaths from home accidents

--Source: Public Housing in Newark. Report of the Newark (N.J.) Housing Authority, November 1944.

Rehoused children in Newark showed improvement in school records, over records before rehousing, as follows:

7% in attendance
10% in academic grades
16% in personality development grades
19% in health habit grades

--Source: Report of Newark (N.J.) Housing Authority, 1944.

Philadelphia public housing projects showed a tuberculosis death rate (per thousand) of .34 percent compared with a city rate of .598; pneumonia deaths in projects .17 percent, city rate .586 percent; criminal offenses in projects 3.14 percent, city rate 33.18 percent; juvenile delinquency in projects 1.27 percent, city rate, 2.84 percent.

The cleanliness of the grounds, the good housekeeping, and the generally excellent deportment and conduct of the tenants and their spirit of cooperation and responsiveness to constructive suggestions, their pride and satisfaction in their surroundings are ample evidence that they appreciate and are making the most of their opportunities to live and raise their families on a plane consistent with the highest levels of social behavior to be found in our better urban communities.

--Source: Homes for War Workers and Families of Low Income. Report of the Philadelphia (Pa.) Housing Authority, July 1941-June 1943.

In Cincinnati, Ohio, a 1940 study was made of the families in a public housing development and figures compared with those of an adjacent slum area and the entire city. In the new homes, the juvenile delinquency per 1,000 population was 1/7th of that in the adjacent tract. The number of criminal offenses committed in the new homes per 1,000 population was less than 1/3 of that in the adjacent tract. There were no fires per 1,000 dwellings in the new homes, compared with 18 in the adjacent tract. Deaths from pneumonia per 1,000 population in the new homes was 1/7 of that of the adjacent tract and less than 1/3 of the entire city. Deaths from tuberculosis per 1,000 numbered less than 1/2 of that in the adjacent tract and somewhat less than that of the entire city. The infant mortality per 1,000 population was 1/5 of the adjacent tract and less than 1/3 of the entire city.

--Source: Tenth Annual Report, December 1943. Cincinnati (Ohio) Metropolitan Housing Authority.

Comparison of figures for fire losses during a 5-year period at the low-rent housing, with those for a 5-year period when the same sites were occupied by slums, shows that the per capita fire loss of $4.34 for the slum area has been reduced to 12 cents per capita. The number of fires in the same areas has been reduced 56 percent.

--Source: Fire Chief, Fort Worth, Texas. As quoted in the Annual Report, Fort Worth Housing Authority, 1948.

The delinquency rate for children of 317 families dropped 1.54 percent after their entrance into a public housing development in New Haven. In the years 1924 to 1940, before moving into the development the delinquency rate was 3.18 per 100 children per year. During the years 1940 to 1944, after becoming residents of the development, the delinquency rate dropped to 1.64 per hundred children per year. These statistics are significant since total juvenile delinquency in New Haven showed an increase of 9.1 percent for the years 1940-41 as compared with 1927-1940. "It seems, therefore, that a substantial improvement in the social adjustment of children in a given group of families may be reasonably attributed to the conditions of project life."

--Source: Naomi Barer, Department of Public Health, Yale School of Medicine, reporting on a study of 317 families living in a New Haven, (Connecticut) public housing development. Journal of Housing, December 1945.

A comparative study of a former slum cleared and replaced by Carver Park, a low-rent public housing development, with an adjoining slum area shows: in Carver Park fire runs decreased 51 percent while in the slum area they increased 5 percent; major crimes in Carver Park decreased 17.5 percent; in the slum area they increased one percent; the tuberculosis rate in Carver Park was reduced by 54 percent. The rehoused area brings a yearly cash saving to the taxpayers of $61,250 in reduced costs for rent relief, fire protection, tuberculosis care, and hospitalization.

--Source: Does Good Housing Pay? A summary of a thesis by Warren P. Phelan. Published by the Regional Association of Cleveland (Ohio) 1948.

"...Incomplete studies of the health of slum dwellers who have been rehoused in public-housing projects in several cities indicate that their morbidity experience improves after they have left slum dwellings. It must be pointed out, however, that community interests developed among the tenants of public-housing projects may well result in the improvement of their nutrition and in making them more conscious of, and hence more alert to use, local public health and preventive medical services. Furthermore, it is easier to provide these people with health services."

--Source: "How Does Housing Affect Health?" by M. Allen Pond, Sanitary Engineer, United States Public Health Service. Published in Public Health Reports, May 10, 1946.

A study of the tuberculosis history of 17 families resident in a New Haven public housing development from three to seven years, and 17 parallel families elsewhere in the city showed:

favorable progress made by fifteen families in the project; nine families in the city.

unfavorable progress made by 2 families in the project; 8 families in the city.

The number of families involved in this study is too small for significant conclusions and the selection of control families--while carried out with meticulous care--must always be subject to error; nevertheless the fact that 15 out of 17 families showed such notable progress under the rehoused conditions is a somewhat remarkable one.

--Source: "A Note on Tuberculosis Among Residents of a Housing Project," by Naomi Barer, Department of Public Health, Yale School of Medicine. Published in the Journal of Housing, August 1945.

Among 11,000 Negro residents in the Wells and Brooks low-rent public housing developments there were 31 deaths from tuberculosis in the 3-year period from 1944-46. This is a tuberculosis death rate of 93 per 100,000, compared with a city-wide Negro tuberculosis death rate of 151 per 100,000 and a Negro slum area rate of 192 per 100,000.

--Source: Monthly Report, Chicago Housing Authority, July 1948.

"Most families in Terrace Village formerly lived in slum or poor areas but, given the opportunity to live in better surroundings, are tending to rise to the level of the community. Some are not able to do so, but these people can be isolated and treated individually according to need. For example, William Jones and his two brothers missed about forty days of school each semester after their mother died in 1936. The father, formerly a good worker, became discouraged and became more and more negligent. The Public Health Nurses assisted the school in getting a housekeeper in the home for a limited period of time, but it was evident we were losing out. Then came a change when the family moved into Terrace Village; the transformation was slow and for a time we feared too much damage had been done, but finally a good home and a good community helped to bring back the pride of home life that had been there formerly. We feel now that success is possible. Note that teachers, public health nurses, housekeepers, recreation leaders, and others were active, but we didn't see results until a decent home was acquired."

--Source: Citizens Look at Public Housing. A Symposium. Published by the Pittsburgh Housing Association; quoting John H. Morgart, Principal, Herron Hill Jr. High School.

24 percent of the families moving out of low-rent developments during the year ended June 30, 1948, expected to move into newly-purchased homes. This compared with 23 percent the preceding year.

--Source: Families moving out of low-rent housing developments, July 1, 1947 - June 30, 1948. Report S.228.0, Public Housing Administration, Washington.

One-third of (194) white families and one-half of (112) Negro families who left North Carolina public housing developments moved into wholly-owned or mortgaged homes. "...It is safe to conclude that the period in the project gave many families time to establish themselves sufficiently to be able to invest in a home...In practically none of the cases were the families capable of financing a home before they lived in the projects."

--Source: Social Aspects of Public Housing. An Evaluation of North Carolina Experience. By Sanford Winston, Head, Department of Sociology, North Carolina State College. 1947.

Fifty of our tenants were able to purchase homes during 1943 and many more rented homes or apartments so that they could move out of our projects. During the first six months of 1944, thirty-five of our tenants purchased homes.

--Source: Annual Report 1943-44. Housing Authority of Omaha (Nebraska).

Fifty-one low income residents felt their financial condition sufficiently improved to justify home ownership. As soon as these families were able to take the next step in self improvement, they left the housing communities and thus made available apartments for other low-income families living in substandard dwellings.

--Source: Annual Report, 1942. Birmingham (Ala.) Housing Authority.

Twenty-nine families moved out of Brewster Homes into homes purchased by themselves. At Charles Terrace, 13 tenants built or bought their own homes. At John W. Smith Homes, 6 purchased their own homes.

"The three low-rent government housing projects have been quick to demonstrate the positive effects upon healthful living which good housing offers...the housing project is becoming the generator of healthful living, immediately influencing the lives of its residents as well as those in the surrounding areas...Of the families included in this study, 15 or 20 percent had better health as a result of improved living conditions..."

--Source: Miss Theresa K. McGrath, Family Society, New Haven, Conn., quoted in the Fourth Annual Report of the Housing Authority of New Haven, 1941-42, on a case study of 30 families living in Elm Haven.

A curious by-product of the establishment of each of the housing developments of this Authority has been the general improvement of the neighborhood outside of the Authority's own premises. Houses have been repaired and repainted and the whole level of the locality noticeably raised in each instance. The fear that a housing development would destroy values in the immediate neighborhood has likewise proven to be fallacious.

--Source: Annual Report, 1945. Housing Authority of Brownsville (Texas).

III. WHO PAYS FOR PUBLIC HOUSING

Public housing is intended for low-income families from the slums who cannot afford to pay the rents charged by private enterprise for decent, sanitary housing. To bring rents in public housing within the means of low-income families a subsidy is provided under the U. S. Housing Act of 1937. The Act divides the responsibility for providing subsidies between the local communities and the Federal Government. The federal subsidy, or annual contribution, is matched by a local subsidy amounting to at least 20 percent of the annual federal contribution. It has been found by local communities that tax exemption is the most feasible form that the local subsidy can take.

MAJOR SHARE OF COST PAID BY TENANTS

The monthly per dwelling unit income is derived from the following sources: The tenant pays 64 percent or $23.63; the local contribution is 15 percent or $5.51; FPHA's contribution amounts to 20 percent or $7.19; and 1 percent or 28 cents is received from other sources.

--Source: Federal Public Housing Authority, Chart #25, "Economic Rent." Statement by FPHA Commissioner, before Senate Subcommittee on Postwar Housing and Urban Redevelopment, November 1945.

In 1946, the total average monthly operating cost per dwelling unit was $31.05 of which the tenants paid $26 for rent, including all utilities. The remainder was made up by the contributions of the local community and the Federal Government.

--Source: Public Housing in the Postwar Era. A Statement before the Joint Congressional Committee on Housing, by the Public Housing Administration Commissioner, January 1948.

TAX EXEMPTION AND PAYMENTS IN LIEU OF TAXES.

Tax exemption is partially offset by payments in lieu of taxes. In return for tax exemption, cities get rid of heavy cost of slum areas, and often receive more in payments in lieu of taxes for new housing developments than the taxes that were assessed against the slums they replaced.

Payments in lieu of taxes for low-rent housing developments in 1944 were 56 percent greater than the full taxes levied on the sites when they were acquired by local housing authorities for slum clearance and redevelopment. Payments totaled $2,026,266, compared to a tax levy of $1,315,583 when the sites were acquired.

--Source: Release No. 278, Federal Public Housing Authority, November 1945.

Total payments in lieu of taxes of $2,285,432 in 1945 reached a new high level as a result of increasing tenant incomes and rents paid. To the extent that rental income declines in future years, these payments will of course also decline.

--Source: Fourth Annual Report, Federal Public Housing Authority, December 1945.

Examples of Payments in Lieu of Taxes Actually Made by Local Communities

A cross section of local housing authorities who own and operate low-rent public housing report that their payments in lieu of taxes are more than the taxes assessed on the properties before redevelopment. Among these are: Tampa, Fla.; Gary, Ind.; Louisville, Ky.; Memphis, Tenn.; Jacksonville, Fla.; Peoria, Ill.; San Francisco, Cal.; Pittsburgh, Pa.; Hartford, Conn.; Muncie, Ind.; High Point, N. C.; Los Angeles, Cal.; New Haven, Conn.; Houston, Texas; New York, N.Y.; Chicago, Ill.; Albany, Ga.; Buffalo, N.Y.; Charlotte, N. C.; Providence, R.I.; Omaho, Nebr.; St. Louis, Mo.; Fort Worth, Texas.

Some examples of these reports are:

Memphis, Tennessee

Since construction of all the projects, a total of $313,160.32 has been channelled into the City Treasury as payments in lieu of taxes on the developments. This was $82,566.02 or 35.81 percent more than the City Government would have derived in tax revenue from the area if it had remained in slums and tax payments had been 100 percent.

--Source: Annual Report, 1945-46, Memphis Housing Authority.

San Francisco, California

Under private ownership the five sites now occupied by permanent low-rent developments brought $30,000 annually in taxes to the City. Payments by the Authority on these five sites for the past year total $146,411.61.

--Source: San Francisco Housing, July-August 1946. The City & County of San Francisco Housing Authority.

Hartford, Conn.

For 1944, Hartford paid to the City $112,597 in lieu of taxes on its aided projects, or six times the $18,746 taxes originally assessed.

--Source: Hartford Housing Authority, 1944.

Houston, Texas

Payments in lieu of taxes, totaling $60,836, in 1944 exceed by $42,829, or 238 percent, the amount of assessed taxes ($18,007, of which about 40 percent was delinquent) on the same property prior to acquisition and improvement by the Houston Authority.

--Source: Sixth Annual Report, 1944-45, Houston Housing Authority.

Omaha, Nebraska

The City of Omaha and the Board of Education were paid $26,151.73 in lieu of taxes for the past year. Such an amount is approximately $16,000 more than was paid by the same areas now occupied by the Housing Authority before these projects were constructed.

--Source: Annual Report, 1945-46. Omaha Housing Authority.

St. Louis, Missouri

Contrary to what any taxpayer might assume at first thought, tax-exemption for public housing saves money for taxpayers. The payment in both 1944 and 1945 was $85,453 which is exactly 251 percent more than the taxes formerly assessed (but never collected in full) on the sites of the two projects.

--Source: Old Brick, Annual Report, July 1946.
St. Louis Housing Authority.

Final Report to the Congress, by Temporary National Economic Committee, 1941. (Gov't. Printing Office, 1941, page 294):

"As to the burden assumed by local treasuries in supporting the housing program, this is much more apparent than real, even in a strictly financial sense. It has already been pointed out that local contributions take the form of tax exemption. Usually, however, the direct financial sacrifice is much less than the theoretical tax loss, since delinquencies are high and collections difficult in the case of run-down slum property of the type frequently involved in U.S.H.A. (low-rent) projects. The replacement of slums by decent well laid-out houses reduces crime, disease, fires, and juvenile delinquency, and hence makes possible a cut in the city budget. The scientific study of urban problems in recent years has shown what a terrible social and financial liability slums are; their elimination, therefore, undoubtedly involves actual financial savings of a substantial sort. Also a housing project invariably raises the value of adjacent real estate, and hence indirectly creates new sources of tax revenue; and, finally, at least during the period of construction, the added employment caused by a project means lower relief and welfare costs."

"It is almost impossible to measure the exact size of these financial offsets to the contribution of the locality, and there is considerable variation from project to project. But it seems safe to assume that on the average the net financial cost to the localities is negligible."

WHAT PUBLIC HOUSING COSTS.

Total actual development cost per dwelling unit, covering all expenditures, including old slum buildings and their clearance, and local authority overhead:

All urban localities, $4,649.

In metropolitan districts:
over 1,000,000 population----------$5,104
500,000 to 1,000,000 population-----$4,972
250,000 to 500,000 population-------$4,448
100,000 to 250,000 population-------$4,296

In smaller localities --- $3,884

Farm Localities, $2,350.

--Source: Chart #12, Statement by FPHA Commissioner. Hearings, Senate Banking and Currency Committee, on S.1592, November 1945.

Federal loans to local housing authorities for housing development are fully repaid with interest, and, under past operations, this interest has been sufficient to cover both the interest cost of the money to the FPHA and the full Federal administrative cost for the program.

The only cost to the Federal Government of public housing is the annual Federal contribution which (combined with the local contribution) keeps rents within the means of low income families' ability to pay. Average Federal contributions per dwelling unit per month since 1941 have been as follows:

1941.....$12.33
1942..... 9.62
1943..... 8.38
1944..... 7.19
1945..... 6.03

From the first payment of contributions in the year 1941 to the end of 1945, the FPHA (and its predecessor, the USHA) paid a total of $46,790,040. This constitutes the full cost to the Federal government of the aided low-rent housing and slum clearance program through 1945.

--Source: 4th Annual Report, Federal Public Housing Authority, December 31, 1945.

The Federal contribution (subsidy) to low-rent housing has averaged $7.25 per unit per month since the inception of the program, and in 1946 amounted to only $4.77. The Federal contribution for rehousing a family has averaged $1.98 per person per month, and in 1946 it was only $1.30.

--Source: Public Housing In The Postwar Era. Statement before the Joint Congressional Committee on Housing, by Public Housing Commissioner, January 1948.

WHO LIVES IN PUBLIC HOUSING

The income limits set by local housing authorities restrict admission to public housing to families who are in very low income brackets and who cannot possibly afford to pay the rents necessary to secure decent private housing.

Over 52 percent of the families admitted to the low-rent housing developments in the first half of 1948 had incomes of less than $1,500, while only 9.3 percent had incomes in excess of $2,000. The average income of families admitted was $1,481.

--Source: Statement by Public Housing Administration Commissioner, before the House Banking and Currency Committee, April 7, 1949.

The first 50,000 families admitted to low-rent public housing came from housing that showed the following substandard conditions:

Structural conditions a menace to health and safety.	58%
No running water	16%
No inside private toilet	62%
No private bath	9%
Artificial lighting inadequate	30%
Cooking facilities dangerous or inadequate	40%
Heating dangerous or inadequate	64%
Daylight or ventilation inadequate	49%
Overcrowded	28%

In 1946, the annual income of the families admitted to pre-war low-rent developments averaged only $1,317, while those admitted to the wartime public housing averaged $1,557.

Families in low-rent housing are required to pay all that they reasonably can in relation to their income. In 1946 the average monthly rent, including all utilities, set for the ensuing year was slightly over $29 on the original low-rent developments. This represented approximately 21 percent of the average income of all families including those with three or more minor dependents.

A RED FEATHER AGENCY

Commission Studies Negro Housing Plan

After hearing a plea from representatives of 127 Negro war veterans for assistance in partly solving the acute Negro housing problem, the Fulton County Commission has called a conference with leaders of white residents near the intersection of West Lake Avenue and Simpson Street, N. W.

The veterans have organized a non-profit organization known as Urban Ville, Inc., and have obtained financing for 127 low-cost housing units. They wish to buy from the County all except a 100-foot strip of 43 acres of County property near West Lake Avenue and Simpson Street. The 100-foot strip would become a park and a barrier betw en the Negroes and whites residing on one side of the property.

Commissioner I. Gloer Hailey explained the County acquired the land from the Grove Park Development Company, which had purchased it to prevent further encroachments of Negroes and had sold it to the County with the understanding it would not be resold to Negroes. He said the County could not sell the property to Negroes unless an agreement was reached with the white residents, but thought a conference might bring results.

The Negroes said they wanted to avoid all friction now and in the future and that the 127 veterans had been screened by a social agency. Negro housing has decreased, owing to the clearing out of rights of way for the expressways and to industrial development, at the time when their need for housing was greatest, they said.

They pointed out the County had torn down 80 Negro homes in Bagley Park, condemned 150 Negro homes for the North-South Expressway and a railroad had evicted 34 Negro families for a warehouse. They also said the Negro population here increased from 129,543 in 1940 to 142,855 in 1947.

Six Negro sections, they continued, had 20,000 persons per square mile, five had 15,500 to 20,449, four had 10,500 to 15,499, [illegible] had 5,500 to 10,499 and only one had less than 5,500 per square mile.

Negro Veterans Housing Plan

Any average discussion of racial problems usually brings up a statement that Negroes pay few taxes and rarely try to do anything for themselves. This is not a sound argument, as the tax digest will show. Also, it is not possible to pay taxes unless one has a job and earns enough to create a tax liability. Further, one of the tragic facts is that too often when Negroes try to do something for themselves they get little more recognition than when they don't.

There is coming up a little testing of our good faith. A group of Negro veterans, each one screened as to character, responsibility and good will, has been incorporated and has a housing plan approved by the FHA.

They ask the county to sell them a piece of ground on which they will construct housing. The section is surrounded on three sides by Negro housing. Across the street on the one remaining side is white housing. But, these Negroes, trying to make sense, and to show good will, have a plan which would fix their boundary 100 feet from the street and which would erect a screen of trees and shrubs between that and the distant street.

Unless some agitator stirs up trouble or starts false reports, which has been done too often in the past, we can conceive of no valid objection. If there is a valid one it will come out in the hearing. We earnestly commend to the Commission that it do all in its power to show to these citizens that an honest, sincere effort to do something for themselves and their people will be recognized and given impartial treatment.

The Atlanta Journal

"COVERS DIXIE LIKE THE DEW"

EDITORIALS 14 MARCH 29, 1949

A Start Is Made on Our Negro Housing Problem

IT IS GRATIFYING to note a news item which indicates that a start is being made in the direction of providing in this community urgently needed dwelling units for our Negro citizens.

The item recited that a Negro housing project is planned on a 46-acre tract off Anderson avenue, adjacent to the new Fulton county park in northwest Atlanta. If approved by the Federal Housing Administration, the project will be financed by the Life Insurance Company of Georgia and will offer 187 single-family dwellings designed to cost between $4,500 and $7,500 each. Construction probably will start within two months.

The project is being sponsored by the Atlanta Urban League, an agency of the Community Chest which devotes its energies to social service among Negroes. We concur with Elbert Tuttle, president of the Atlanta Chamber of Commerce, in his characterization of this announcement as "a first step in solving one of Atlanta's major problems." It is only a small step toward meeting the total need for Negro housing in this area, but it is our hope, along with that of the Atlanta Urban League, that this beginning may serve to encourage others who are in a position to make a larger contribution toward the remedy of the problem. We cannot afford to wait too long to take additional steps.

CHICAGO

A Big City Has Big Problems

LOUIS WIRTH

THE Report of the President's Committee on Civil Rights has prompted many steps toward democracy. Although Chicago is proud of her part in this year-old progress, temporary setbacks leave some blots on the city's record.

During the past few years, Chicago has continued to be a favorite place of migration for thousands of Negro families from the near and lower South, for a substantial proportion of Japanese-Americans from wartime camps and for thousands of displaced persons. Despite the housing shortage, which is the main obstacle to their full and easy incorporation, these newcomers are being absorbed into the life of the community.

Too Little Shelter

Chicago's housing problems were serious before 1941, were aggravated by wartime demands, and became acute when the end of hostilities brought home service men and women, anxious to found new families. In the face of a negligible addition to the total housing supply, and that at prohibitive cost, the problem of finding living space for in-migrants has generated hardships and understandable bitterness. For Chicago's increasing number of Negro residents, the search for shelter has been further complicated by barriers of racial exclusion.

The story of the Airport Homes Project, in November 1946, received national attention, when the Chicago Housing Authority's attempt to settle a few Negro families in the dominantly white-tenanted project resulted in mass demonstrations and violence. The police were slow in meeting their responsibility. Finally, the few Negro families originally assigned to the project moved out.

But the unfortunate incident did not end there because it stimulated constructive groups to bring the issue to public attention. As a result, there emerged a clearer policy on the part of the Chicago Housing Authority and of the city administration in support of nondiscriminatory principles in housing and of policing adequate to prevent disorder and violence.

Six months later, when another racially mixed project in Fernwood was about to be occupied by the assigned Negro and white tenants, plans to avoid a repetition of the Airport Homes experience were developed in advance. Efforts to welcome the tenants included a canteen established to dispense food for their convenience on moving day. Police were present to prevent disorders. During the evening, the project and the adjacent area were closed to motor traffic, and the police detail was increased. But on the second night, a crowd gathered, and soon degenerated into a mob bent upon ejecting the Negro tenants—by violence if necessary. Unable to reach the project itself, the crowd surged to a nearby main thoroughfare and began stoning Negro motorists. Greatly strengthened police forces were able to disperse the mob, but the disorders were resumed the next night. Even the police were violently attacked. More than a score of arrests were made, and, with the resumption of violence on the following night, nearly a hundred additional arrests were made. Subsequent court hearings showed that a part of the mob consisted of youths imported from neighboring areas.

Law and order were victorious because, as in many other similar instances in Chicago and elsewhere, the Fernwood experience proved that an unequivocal policy of nondiscrimination, consistently practiced and adequately enforced, can win the overwhelming support of the public, provided adequate preparation is made in the local community.

Although organized violence on this scale has not been repeated in Chicago, Negro in-migrants to hitherto white areas have been subjected to sporadic outbursts, vandalism, and even to arson and bombing. Fortunately, few Negro families which have moved into white areas have yielded to intimidation; even fewer have attempted retaliation. But overt and subtle resistance has significantly retarded the ability of Negro families to escape from slums and congested areas.

During the past few years, however, Negro families have been increasingly able to move, and some Negro residents can now be found in more than forty of the city's fifty wards. The notable Supreme Court decision of May 3, 1948, making racially restrictive covenants unenforceable in the courts, has deprived residential segregation of its most effective sanction. It is not to be hoped, however, that it will suddenly

revolutionize long-established attitudes and patterns of settlement; nor has it so far appreciably expanded the total housing supply available to the majority of the Negro population.

While some of the greatest difficulties in the improvement of intergroup relations in Chicago, as in other cities, have been met in the field of housing, similar problems have been encountered in employment, education, health, welfare, recreation, the administration of justice and the use of public and quasi-public facilities.

The City Defends Its Citizens

Chicago's Commission on Human Relations has continued to serve as an effective public agency, and now receives the official support of the municipal government, both financial and moral. Its vigilant and accurate reporting of cases of discrimination, tension and violence—actual and threatened—has helped to check outbreaks. Of special interest, from the point of view of public education and citizen participation, was a city-wide Conference on Civic Unity, in which the problems and progress of the city were reviewed before a group of citizens representing the many organizations concerned with improving racial and cultural relations.

Citizens Defend Each Other

Corresponding to the work of the Commission on Human Relations, on the public side, is the vigorous activity of the Chicago Council Against Racial and Religious Discrimination. It has served as a fact-finding body, as a watchdog and critic, catalytic agent and mediator and, on every crucial occasion, as the mobilizer of constructive community opinion and action. Churches, labor unions, civic organizations, and specialized agencies representing minority groups have cooperated under the Chicago Council's leadership in many crucial efforts to prevent undesirable incidents and to guide the city in the pursuit of democratic policies.

To Secure these Rights has inspired many of the institutions of the community to reexamination of their policies and operations. A notable instance is Michael Reese Hospital and its associated facilities, including its School of Nursing and Mandel Out-Patient Clinic. This institution, operating under the auspices of the Jewish Charities of Chicago, has developed a policy of serving all members of the community, irrespective of race or creed, and has set such an excellent standard for similar institutions that it has received a special award from the Commission on Human Relations.

The Neighborhood Spirit

Neighborhoods in Chicago have also organized themselves in behalf of freedom and justice, sometimes fostered by the Council of Social Agencies to improve housing, health and welfare. Of special interest is the Back-of-the-Yards Neighborhood Council, an effective instrument for education and common action among the scores of business, labor, church, health, welfare and other organizations in the stockyards area.

A unique program of training police for dealing with intergroup problems, under the auspices of the Chicago Park District, is being continued, and serves as a model for a number of police departments throughout the country.

In the Chicago public schools, the General Superintendent has inaugurated a program which goes far beyond what is conventionally done under the name of intercultural education. Undertaken in cooperation with Chicago University's Committee on Education, Training and Research in Race Relations, this program seeks to develop and utilize the resources of social science research, in the better understanding and solution of problems of intergroup relations, as well as to train professionally competent experts in the field.

A Center of National Planning

The American Council on Race Relations, recognizing the need for more effective exchange of information, for the development of professional standards and for a medium of contact between the many hundreds of public and private, federal, state and local agencies in the field of racial and intergroup relations, cooperated with a group of leaders representing agencies from all parts of the country in establishing the National Association of Intergroup Relations Officials. Under the auspices of the American Council and of NAIRO, Chicago has been host to two national conferences on intergroup relations, one held when the President's Committee Report was first issued in November 1947, and the second, a year later, in November 1948. These conferences, attended by several hundred policymakers, executives and professional staff members of agencies and organizations throughout the nation have helped to clarify issues, to analyze policies, to evaluate techniques and to promote mutual understanding and professional standards.

Altogether, Chicago has taken *To Secure These Rights* seriously, for the Big City is awake to its responsibilities in moving closer, day by day, to the ideal of a democratic America.

SCHOOL OF ARCHITECTURE
GEORGIA INSTITUTE OF TECHNOLOGY
ATLANTA GEORGIA

THE REDEVELOPMENT PROJECT ON DISPLAY AT THE ATLANTA URBAN LEAGUE, JUNE 27 - JULY 1.'49

ORIGIN

Three months ago a new quarter at Georgia Tech began, and senior architectural design students were given the assignment to make a survey of housing and living conditions in Atlanta Census Tracts F-17, F-18, F-28 and F-29. Following a five-week period devoted to this research, based on personal observations and facts and figures obtained from city, state and federal officials, the students were to develop the given area through models and sketches in order to achieve the basis of design upon which actual cost analysis and rebuilding would have to stand.

FINDINGS

They found that taken as a whole, the four tracts are the center of the worst slums in Atlanta. Even were the major area not already slums, the symptoms of slum growth were evidenced in the increased industrialization within the area and around the fringes. In the area of Census Tract F-17, 82.6% populated by whites, conditions were found to be much better. However, a liberal sprinkling of blighted areas exist in the southeast corner of this tract, as well as in the heart of the area. Within the definition of the word slum (an area where there are 75% or more houses which are unsafe, unhealthy, or detrimental to good morals), a portion of Tract F-17 remains in the classification of slums.

Because available statistics on disease, crime, and dwelling conditions are tabulated by census tracts, and because the five major trafficways---Piedmont Ave., Courtland Ave., North Ave., Edgewood Ave., and the Southern R.R. Belt line-- define an area which stands or falls together, Census Tract F-17 was included in its entirety in the research and redevelopment studies. It is interesting to note that slum conditions are encroaching on this area from the adjacent slum areas as well as from within its very center which are an indication that, sooner or later, they will engulf the large area of relatively good conditions.

For the City of Atlanta and most of its citizens, slums constitute a losing business. The resources of the city poured into the four census tracts under consideration for crime, disease, and fire prevention and correction are in the ratio of at least nine to one in taxes received from the area. Thus, for an input of nine dollars ($9.00) in city public services, the city gets a one dollar ($1.00) return in taxes.

Structures in the slum areas are entirely opposed to the concept of health. At least 12% of dwellings have their access in narrow, nameless alleys, 22% of the houses are without kitchen sinks, and 23% have only back-yard water taps, shared with other families. Furthermore, 78% of families have no washing facilities such as a wash-basin or laundry tub. Only 33% of these families have inside, private toilet facilities, and 45% have no bath facilities. And 37% of all units have a plague of rats and other rodents or insects. Is it any wonder that census tract F-28 reported more new cases of tuberculosis in 1948 than any other census tract in Atlanta?

PLANS

In the display of drawings and a scale-model layout of the redevelopment of the area, the students have utilized the latest thinking and methods in community planning. They have not only provided houses for residential purposes, but also buildings for schools, hospitals, clinics, churches, recreational centers, and community shops. Although developed as a whole, individual community areas provide for separation of white and colored people in their respective communities. Parks, green areas and other outdoor recreational areas, now practically non-existent, are provided.

The cost of redevelopment has been estimated by the students at approximately $72,000,000. This includes purchase of the area at the assessed value of the sum of $12,754,000. The method utilized for financing and construction is beyond the scope of this study -- this is something that will have to be worked out by city officials and interested citizens.

CONCLUSION

Once you have concluded that something must be done, will you stop to consider the advancements in technology and the perfection of planning theories which have made healthy cities out of slums -- Framingham, Mass., and areas of Chicago, Baltimore and London. Modern practices in architecture, city planning, and construction engineering presents opportunities which may enable you to rebuild Atlanta into something of which we can be proud, instead ashamed. We hope you will consider the ideas presented here in this display, come to the decision that slums are bad business for the majority of us, and then that you will consider what you will do to remedy the situation.

Hopefully yours,
SENIOR ARCHITECTURAL DESIGN STUDENTS

PLANNING THE NEIGHBORHOOD

American Public Health Association — Committee on the Hygiene of Housing

★ THE PRESENT HOUSING CRISIS offers a matchless opportunity to replace substandard housing as well as to meet the need for new construction. It is a task that demands vision and knowledge, courage and speed.

To help in the solution of the problems involved, the American Public Health Association's Committee on the Hygiene of Housing has for some years been studying the factors basic to the construction of safe, healthful, and comfortable housing. In PLANNING THE NEIGHBORHOOD the Committee has utilized the knowledge and experience of a subcommittee headed by Frederick J. Adams and including leading experts in planning, housing, and health to formulate a body of concrete and definite standards for the development of residential areas. The volume formulates good practice for every phase in the physical production of healthful and pleasant neighborhoods.

PLANNING THE NEIGHBORHOOD is scientific in approach and documentation, wide in coverage, readable in style. Eighteen tables and four appendices, including an annotated bibliography, contribute to its usefulness. The book should prove of decided value to all those who share the responsibility of providing new homes for America.

How many families are needed to support the facilities of a livable neighborhood?

What factors assure a healthful site for the neighborhood?

Why is it often desirable to combine houses and apartments in the same neighborhood?

What is a reasonable limit of building density for single-family houses? for tall apartments?

How does a good neighborhood plan reduce accident hazards?

What is the longest walking distance children should cover between home and elementary school?

How small may a playground be?

What exposure will give buildings most desirable light and heat from the sun?

How should dead-end streets be designed?

What kinds of community buildings, services, and open space does a neighborhood need?

What services and facilities must be assured by the larger community?

When is individual sewage disposal tolerable?

When is offstreet parking a good idea? a bad one?

Answers to these and many other related questions will be found in

PLANNING THE NEIGHBORHOOD

90 PAGES (LARGE FORMAT) 4 APPENDICES 18 TABLES

INDEXED SOFT COVER

PLANNING THE NEIGHBORHOOD is the first in a series of three volumes by the American Public Health Association, Committee on the Hygiene of Housing, to be published by Public Administration Service under the over-all title *Standards for Healthful Housing*. Each book will be complete in itself. To be published later:

ESCAPE

COMMITTEE OF RACIAL EQUALITY
4643 S. Michigan Avenue
Chicago 15, Illinois

Dear Friend:

Enclosed is our new pamphlet, ESCAPE, which presents the essential facts about restrictive covenants. It is by covenants that segregation is enforced in Chicago, and segregation is the real source of all the evils which confront Negroes today.

CORE is pledged to fight these covenants. That is why we have prepared ESCAPE. But we need your help, both in distributing ESCAPE to as many people as possible, and in paying the printer.

Realtors are willing to spend large sums to protect the profits which accrue from covenants. Shall we be less generous in protecting fellow human beings?

Confident of your cooperation, we are,

Housing Unit
Committee of Racial Equality

Ronnie Gets A New Home

"Here, Mrs. Killpatrick, is my baby. I can never tell you how much it means to me to have you take Ronnie for a while. When we met in the Clinic I was at my wit's end for a safe place for him, away from

those terrible rats. Now, the Doctor says his leg is healing nicely. Perhaps I'll soon be able to find another flat, tho I'm pretty well discouraged."

"Come to me, Ronnie. Look, children, a new baby brother! Such a pretty boy! I shudder to think, if you had come back just a few minutes later, those rats would have . . . Well, Mrs. Garmley, you can be sure that there are no vermin in this house! And of course we'll take good care of him!"

A Baby Bitten by Rats?

Yes, those wrappings on Ronnie's arm and leg cover rat-bite holes, where a big rat had been chewing, when he was interrupted by Mrs. Garmley's return from the grocery. Fearful of what might happen if the rats get a second chance, she is leaving her baby with Mrs. Killpatrick, who lives in a neighborhood where garbage is collected regularly, the houses more solidly built, less crowded, and where consequently there is no danger of rats.

Why Doesn't Mrs. Garmley Herself Move Into a Different Neighborhood? Can't She Afford Anything Better?

It is not a question of money, but of race. The Garmleys are colored. The father is over-seas with the army; Mrs. Garmley and her five small children live in a dark two-room flat on Chicago's overcrowded South Side. Garbage cans stand unemptied in their alley for days. They share the only bath room in the building with several other families.

One day last November, Mrs. Garmley returned from the store to find a rat in Ronald's crib, gnawing at the child's leg. Snatching the screaming baby, she carried him to Provident Hospital, where he was treated for three weeks. Meanwhile, Mrs. Garmley and her

neighbors sought in vain for another flat. Staff workers of the hospital and the Metropolitan Housing Council joined in the hunt, for they too were afraid to return the baby to its home. But there were absolutely no vacancies to be found; what few unoccupied homes there were in the city stood in white neighborhoods.

Luckily, the Social Service Office of Provident Hospital succeeded in finding a foster home, which provided a safe temporary place for the infant. But it was only because of Mrs. Garmley's quick thinking in the emergency that greater tragedy was avoided.

You Say the Garmleys Could Not Rent a Better Home Because They are Colored. How Can This Be, in a Democracy?

In Chicago, and many other cities, Negroes are kept within certain small districts, largely by means of Restrictive Covenants. Once these districts are filled, any additional residents simply create overcrowding. Thus, the total area made available to Negroes has not substantially increased since 1920, but the population has increased from 110,000 to 360,000 during this time. Meanwhile other sections of Chicago have expanded normally to accommodate the growing population.

What are Restrictive Covenants?

Restrictive Covenants are agreements made by property owners in a neighborhood, whereby they bind themselves not to sell, rent, or transfer their property to Negroes. Although Covenants are aimed largely at Negroes, in many instances Jews, Italians, Mexicans, Poles and others are restricted from certain areas and thus made liable to exploitation. Most of the Covenants are worded—"the lands shall not be sold to or occupied by persons not of Caucasian race nor to Europeans

except such as are of English-speaking countries and the French and the people of French descent."

How Did Restrictive Convenants Originate?

The Covenant is a device hit upon to evade the law. Early in the present century, the Supreme Court threw out as unconstitutional, ordinances passed by several cities, which restricted Negro residency to special districts. To accomplish what the ordinances would have done, realtors have guided the development of these Covenants.

In Chicago, they began during World War I, a time which saw a greatly increased in-migration of Negroes to fill the labor shortage, combined with a standstill in the construction of private homes. They are still being promoted, because the whole community continues to suffer from a lack of adequate housing. Too many people cling to the cruel principle of segregation under the illusion that it will protect them from the results of this scarcity.

Many short-sighted and backward property owners tolerate these Covenants and even assent to them by signing their names, because they mistakenly suppose that the wretched conditions of some Negro areas are due to the tenants' race. They are frightened at the thought of their own neighborhoods turning into such slums. But apart from concern over physical deterioration, is the fear of many white people that they will lose the respect of their friends if they live in "mixed" neighborhoods. They act as though their friends are not trustworthy!

Not a few owners, however, afterwards have regretted signing a Covenant. For, with their families grown and gone, they have wished to sell, but could find no interested buyer, other than Negro, willing to pay a fair price.

Who Actually Promote Restrictive Covenants?

Those who promote Covenants today are chiefly realtors who seek to protect the high rentals which overcrowding makes possible. To them, a strengthening of the Covenant system is simply additional insurance against a decline in profits.

But Isn't it Obvious that Negroes Ruin a Neighborhood?

No. Isn't the question rather: aren't they forced to move into already ruined neighborhoods? Enlightened Americans know that such housing conditions are due

"May be a vacancy here next month."

to natural decay, hastened by heavy overloading and a complete lack of upkeep by the owners. The older and more dilapidated these homes become, the more people are crowded into them, driven by the twin evils of poverty and segregation.

Municipal Judge George Quilici has said, "Restrictive Covenants lead to rapid deterioration of residential neighborhoods and the spreading of blight to surrounding territory. They actually create conditions which their sponsors seek to prevent. Furthermore, restrictive Covenants tend to increase racial tensions."

When Negroes and other segregated groups are forced to live in unhealthy conditions by being crowded into tenements—from which, like Mrs. Garmley, they naturally try to escape—pressure on other neighborhoods always follows.

You Say That the Principle of Segregation Is Cruel. Why?

It is cruel first of all because it is a perpetual insult. Secondly, it deprives a minority of normal social life; which is a denial of man's nature as a social being. Lastly, its tragic results, as we see them in Chicago—of which Ronnie's case is only a sample—are so horrible that it is hard to believe that people continue to ask this question.

But Is Not Segregation a Good American Custom?

No. As seen above, segregation became fixed in Chicago only during the last World War. Surely, the true American tradition is something older than that! Its essence is in the Declaration of Independence, reminding the haughty that:

"All men are created equal and endowed by their

Creator with certain inalienable rights, among which are life, liberty, and the pursuit of happiness."

But even today, Negro and white live side by side in parts of Baltimore and many other cities, as they have since Colonial times. So those Chicagoans who, in the face of embarrassing injustices, prefer to look toward the past, need not fear that they will be doing something entirely new if they decide to end the unnatural custom of segregation.

Wouldn't a Mixed Neighborhood Be More Liable to the Danger of a Race Riot?

No. Just the opposite. Race riots occur between people who do not know each other. Investigators who studied the Detroit riot of 1943 reveal that the worst clashes took place in all-white or all-Negro areas; the mixed neighborhoods suffered much less. In 1920, the Commission on Race Relations, appointed to study the Chicago race riot of 1919 concluded—

"We are convinced by our inquiry, that measures involving or approaching segregation are illegal, impracticable and would not solve, but would rather accentuate, the race problem and postpone its just and orderly solution by the process of adjustment."

Are There No Homes Free of Covenants, into Which Negroes Could Move?

Yes, there are some, but it often happens that when a Negro succeeds in finding a house not covered by a Covenant, he meets with violence in attempting to move in, so that he is forced to resell, if he has purchased the house. The case of Mrs. Virginia Dobbins—October, 1944—is well known. Having made a down payment of $650 on a cottage just two blocks inside a white neighborhood, she prepared to move in, only to find the house

burned down. Through the efforts of CORE, Friendship House, and Blessed Martin Center, $350 was raised for her as a partial restitution of her loss, but of course no amount of money could erase the shock of such a reception.

In a "mixed" neighborhood, where mutual interests and community affiliations promote understanding and tolerance, no one would think of setting fire to his neighbor's house. An act of the Legislature, or a Supreme Court decision, invalidating race Restrictive Covenants, would make plain to all that discrimination is illegal. When this is clearly understood, and when that prejudice, which is the result of misunderstanding and lack of contact beetween racial groups, is eliminated by closer relationships, today's terrorism will be abandoned.

Isn't it Wrong for the Government to Interfere in Such private Contracts as Covenants?

Although private in theory, anything which robs more than 350,000 Chicagoans of health, decency and happiness is obviously public, and therefore a matter for government concern. Minimium-wage laws were at first opposed by vested interests as interference with "private" affairs, but the public need finally prevailed, and no one now protests against these regulations.

What Can I Do to Help End This Unjust System?

A great deal:

1. Write to your representative in the Illinois Assembly.
2. Tell your friends about the unfairness of Covenants.
3. Don't sign Restrictive Covenants.
4. Rent or sell to people on the basis of need and trustworthiness; not on the basis of national origin.
5. Make a point of inviting friends of other races into your home, and visit in their homes.
6. Support those who appeal Covenants in the Courts.

DON'T FENCE ME IN

What and why

PUBLIC LOW-RENT HOUSING

Low-income families who lived in substandard housing have been rehoused in homes like these in 35 States, the District of Columbia, and 2 territories. Public low-rent projects are planned, built, owned, and operated by local housing authorities. The Public Housing Administration helps—but the communities do the job.

PUBLIC HOUSING ADMINISTRATION • HOUSING AND HOME FINANCE AGENCY
WASHINGTON 25, D. C.

Parkdale, Great Falls (Mont.) Housing Authority.

What Is Public Low-Rent Housing?

Public low-rent housing is housing built under the United States Housing Act and State housing laws to provide decent homes at low rents for families of low income. Such housing is built only after the local community makes a formal decision that it is needed. The construction job is undertaken by the community's local housing authority, through private contractors. As a nonprofit public agency, the local authority owns and operates the project, establishes the rent scale, selects eligible families, takes care of repairs and maintenance, and other management functions. Of approximately 193,000 dwelling units authorized by the U. S. Housing Act, 168,000 are completed and in operation.

What Are Local Housing Authorities?

Local housing authorities are agencies created under State laws for the principal purpose of owning and operating public-housing projects. Each of the nearly 450 local housing authorities is governed by local commissioners (usually five) who are appointed by the mayor or governing body and who serve without pay.

How Does the Federal Government Help?

Congress has authorized the Public Housing Administration, a constituent

Mulford Gardens, Yonkers (N. Y.) Housing Authority.

of the Housing and Home Finance Agency, to make Federal loans to local authorities up to 90 percent of the development cost. Most authorities, however, have been able to obtain part of their capital direct from private sources at lower interest rates. To help keep rents within the means of low-income families, the PHA also provides an annual contribution, or subsidy, furnishes technical advice, and reviews local policies to see that they meet requirements of the law.

What Is the Purpose of Public Low-Rent Housing?

The U. S. Housing Act was passed in 1937 to provide Federal aid to communities for "families . . . in the lowest income group . . . who cannot afford to pay enough to cause private enterprise . . . to build an adequate supply of decent, safe, and sanitary dwellings for their use." Many low-income families have had to live in slums because they could not afford good, privately owned housing, used or new.

Who Is Eligible To Live in Low-Rent Housing?

The family must be living in a substandard dwelling, the family head must be an American citizen, and the family income must be below the level needed to obtain adequate, privately owned housing. Low-income families of servicemen and veterans, because they often lack accommodations of any

North Boulevard Homes, Tampa (Fla.) Housing Authority.

kind, need not come from substandard housing, and are given preference for admission.

What Does Public Low-Rent Housing Cost To Build?

The total development cost of low-rent housing, nearly all of which was built before the postwar price rise, has averaged $4,649 per dwelling unit. This includes the cost of land, old slum buildings torn down where slum sites were used, site improvements and utilities, all construction costs, equipment, architects' fees, and local authority overhead and carrying charges. All construction is done by labor paid prevailing wages, and the housing is designed for a long life of economical service and hard wear.

How Much Income Have Families Living in Low-Rent Housing?

The average weekly income of tenants admitted in 1940 was $14.92. In 1945, new families admitted averaged a weekly income of $24.21, a reflection of the general change in income levels that occurred during the war. Despite wartime increases in income, however, the average income of all families in low-rent housing was only $30.11 per week in 1945.

How Much Rent Is Charged in Low-Rent Housing?

Rents are based upon income, and families pay what they can afford for

Harbor Hills, Los Angeles County (Calif.) Housing Authority.

the quarters they require. Rents for families admitted in 1945, including charges for heat, light, cooking fuel, and other utilities, averaged $22.59 monthly. The gross rent for all families living in low-rent housing in 1945 averaged $27.46 per month. If the cost of utilities is excluded, basic shelter rents would average about $5 less.

How Much Does Low-Rent Housing Cost the Federal Government?

Under the present legislation and procedure the only cost to the Federal Government is the annual contribution, or subsidy. In 1945, this cost was $6.03 per month for each family housed, or a total of $8,015,196. This is an abnormally low figure because incomes of tenant families were higher than usual. The major share of the housing cost is paid by tenants in rent. A contribution (equal to at least 20% of the Federal subsidy) is also made by the local community, through tax exemption.

Does Low-Rent Housing Pay Local Taxes?

While State housing laws exempt low-rent housing from local taxes, local authorities make voluntary payments in lieu of taxes up to 10% of shelter rents. In 1945, these payments in lieu of taxes amounted to $1.86 per dwelling per month.

Does Low-Rent Housing Clear Slums?

Yes. When a project is built on a slum site the old structure must be torn down to make way for the new. But even when a project is built on vacant land, an equivalent number of slum dwellings elsewhere in the community must be demolished, closed for occupancy, or improved to meet decent standards. Local housing authorities have already secured the elimination of 87% of the required number of substandard units. Elimination of the remainder has been deferred, as permitted by law, because of acute housing shortages.

Does Private Business Have a Part in Low-Rent Housing?

Yes. Land is purchased from owners at fair market prices. Private architects and engineers design the projects, draw the plans and write the specifications. All construction work is done by private contractors on the basis of competitive bids.

How Does Low-Rent Housing Differ From Public War Housing?

Low-rent housing is built by local housing authorities for low-income families who cannot afford to pay for decent private housing. Public war housing was built at Federal expense and managed as part of the war production effort, for in-migrant civilian war workers and military personnel, without regard to income. Rents in war housing are comparable to those charged for private housing; in low-rent housing, rents are based on family income. Unlike low-rent housing, which is built for long-term use, most war housing is of temporary construction. All war housing must be disposed of as it becomes surplus to veterans' and other demobilization needs.

AUGUST 1947

This bulletin was prepared by the staff of the National Housing Agency and arrangements for publication were made by that Agency. It is being issued by the Housing and Home Finance Agency, which succeeded NHA pursuant to Reorganization Plan No. 3, effective July 27, 1947.

Crowded, dilapidated structures replaced by homes below.
Clarksdale, Louisville (Ky.) Housing Authority.

The fallacy, believed by many, that nearly all Negroes are potential, if not actual law breakers, was exposed by this study. The land occupied by Negroes in the city of Durham was divided into nine different areas based

Table IV

Negro Crime Rates in Durham

Negro Crime Area Number	Number of Resident Families	Number of Criminals	Crime Rate Per 100 Families
1	227	115	50.7
2	686	280	40.8
3	695	193	27.8
4	410	109	26.6
5	717	136	19.0
6	544	62	11.4
7	704	80	11.3
8	491	48	9.8
Total	4,474	1,023	22.8

on geographical features. For each area the crime rate per 100 families was calculated as shown in Table IV. The delinquency rates were arranged in order of frequency and showed a distinct ecological pattern with a steady decrease in the amount of criminality as the distance from the center of the city increased. These areas can be briefly characterized as follows: number one, an area of changing use adjacent to the main business district. Area two, poorly built slums south of the business section beyond railroad yards and tobacco factories. Area three, situated just south in a badly drained hollow. Area four, along a busy street to the north of the business district. Area five, on the hill beyond the

railroad and the valley. Area six, small, isolated Negro settlements removed from the center of population. Area seven, far to the south, the best Negro residential section. Area eight, two little country villages recently taken within the northern limits of the city.

READING LIST

ON

H O U S I N G

The following "Reading List" was compiled to assist the general lay reader. Few references to specific articles in periodicals are listed because of the constantly increasing volume of such material. Those interested in the developments as reported in magazines are referred to the periodicals listed herein.

In the hope of increasing its usefulness, the "Reading List" has been arbitrarily separated into publications costing a dollar or less, and those costing more. It has also been separated into subdivisions to supply general guidance to assist the reader, and not to define precisely the subject matter or the exact limits of the publications listed.

SUMMARY OF SURVEY: CREW-FORMWALT AREA

PROPERTY OF
SOCIOLOGY LIBRARY
EMORY UNIVERSITY

This statement is an effort to emphasize certain of the aspects of this area which might be important in the attempt to make a practical plan for delinquency prevention. Some of the facts here listed are assets; most are liabilities.

There are about 30,000 people in the section, of whom about 75% are white. Over half of the adults have not completed the sixth grade. Can neighborhood action develop a practical plan of action for realistic adult education?

The five thousand dwelling units are predominantly tenant-occupied. Although it may be impossible to do much here, the 2,000 units needing major repair(40%) and the 1,700 units needing either flush toilets or running water present a challenge to action. Of the units which have plumbing, much is not in working order. Merely to destroy the housing will increase room-density elsewhere. There is an average of three persons per room in the area- and this includes everything which goes by the name. The occupancy of bedrooms is much higher. Can the Committee help furnish the energy needed to continue the present attack of the city on its slums?

There are over 3,000 white, 1,500 Negro children in the area under 15 years of age. Of the whites, 1060 (33%) attend either Crew Street or Formwalt School. These are the people with whom the Committee may hope to take effective preventive measures.

Sixty-two percent of these children are undernourished. At present some part of their school lunches are furnished free to only 184 children, leaving four hundred and fifteen to grow up in this community with inadequate food. This is likely to remain a local problem as is most general relief. Can this Committee take action to make food available to these children?

In one school eleven percent of the children have active tuberculosis. They are still a part of the school community, since there is no provision for their treatment elsewhere. There are 52 of these children.

Forty-six percent of the juveniles represent broken homes. That means that one parent is now missing. Can the community be assisted in offering these children the warmth and security they are denied through no fault of their own? Can this Committee do anything about this?

Working mothers support or help support forty-four percent of this group. Who cares for the pre-school child? Who cares for the school-child once he is released from school supervision? Most parents cannot afford to pay for commercial day-nursery care. Can this Committee bring the resources of the larger community to bear on this vital phase of the attack on delinquency?

In one school one out of every five children represents a family receiving some form of public assistance. This 21% is not the whole, probably. The Committee has helped increase food budgets recently by 20%, in concert with other civic groups. Can the Department of Public Welfare furnish assistance to all the families which need it? It could be a function of this Committee to assist in the further efforts to increase available local funds.

A recent check in one school showed one student (0.2%) who belonged to a recognized youth-serving agency. In this same school the students were occasionally taken on field trips - to visit churches. Many have not been inside a church until taken on the tour. This indicates a definite need for leadership to turn the common gang activities into healthful acceptable channels which might make creative rather than destructive these gang energies. Many well-known activities are too expensive for the students in this area. Should this Committee attempt to find and support the leadership needed here?

There are eighteen churches in or bordering this area. Their estimated membership from this community is about 10% of the population. There are three missions operating here, performing certain functions of community centers. These people cannot sustain their necessary religious activities, and much of their finance comes now from outside. Are there other religious groups which would sponsor neighborhod centers and supervision for them? This Committee's neighborhood section has here another line of action.

Between Formwalt and Crew Street Schools lies Fulton High School which draws its students from outside the city. Hoke Smith High School, which draws from this area, is almost surrounded by a heavy Negro population. Any effort of this Committee through the schools will logically be based on elementary school locations consequently.

This ten percent of Atlanta's population furnishes 33% of all emergency calls from Grady Hospital based on violence or drunkenness, according to our survey over a week's time.

Limitation of personnel requires the police force to assign only one car in daytime to this area plus all south to the city limit. At 4:00 P.M. two cars split the same territory, and another cruises the Pittsburgh section as the eastern portion of its beat. There are no police assigned to walking beats in this whole area. None of the surveyors saw a policeman during their study. It takes more money to hire more policemen- but it costs more to imprison law-breakers.

The Crew-Formwalt section is not without leadership. It is generally accepted that local leadership is the most effective force in neighborhood efforts in prevention of crime. The teachers and the two school principals are an important (and highly cooperativ' resource. There are forty-eight active parent-members of the P.T.A. In the religious organizations there are 86 volunteer sponsors of various youth activities. A concerted effort will use as many of these leaders as possible, and others will be discovered in the course of the work in the community itself.

During the course of this survey it has been learned that various other groups are active in this section, and their results will be presented to this Committee when a phase is completed. More detailed study is continuing under the auspices of the Research Section. This will be reported also as it becomes available.

It is hoped that this presentation will point to specific action which may be immediately undertaken, and will be a basis for discussion of other specific goals which will be developed by the neighborhood section itself.

THE CREW-FORMWALT AREA

The areas shown on this map include the Crew Street(C) School, the Formwalt School(F), the F.P.Johnson(J) and that known as "Pittsburgh." The two former are predominantly white and the latter have mostly Negro population. Although they do not exactly coincide, they roughly include Federal Census Tracts F-44 through F-48. The population characteristics(below) are based on these Tracts.

POPULATION CHARACTERISTICS: ~~(F.P.Johnson area excluded)~~

Whites under 15 yrs..... 3158
Negroes under 15 yrs..... 1521

Educational attainment(adults over 25).... 5.7 yrs.
This median indicates that over half of the adult population has not completed the sixth grade.

Total housing units..... . 5319
Tenants.....88 to... 95%
Units needing major repairs.....40%..... 2187
Units without flush toilet or running water.....33%..... 1748
Units without any refrigeration..22%.....1200
Persons per room...(median)..... 3 to.... 3.15

Churches: There are twelve churches in the area, eight bordering it. The breakdown is Baptist,6; Assembly of God,2; Methodist,2; Prespyterian,2; Synagogues,2; Church of God, Christian, Greek Orthodox, Roman Catholic. (Churches are listed in detail on another sheet.) The figures below are partly counts, partly estimates. They give a reliable overall picture although the averages would not be true for any one group.

Total Membership in area.....3536....Active.....1768
Under 12 years..... 172
12-18 yrs..... 612

Sunday(or Church,not including Parochial or other)
Schools..... 12
On membership rolls..... 1741
Active..... 1026
Under 12 yrs..... 627
12-21 yrs..... 345

Youth Organizations:
For youth under 12 yrs..... 16
Attendance..... 92
For youth 12-21 yrs..... 35
Attendance..... 405
Counselors, sponsors, etc..... 86
Paid assistants(Incl. teaching Nuns, tchrs. at Synagogues)..... 19

Churches:(Cont'd)

Formwalt School has a Sunday School in its building on Sunday afternoon.

The Prior Street Mission takes care of local youth activities for Prior St. Baptist Church.

The Atlanta Mission functions in this area with its non-denominational community activities.

The Area Generally:

Twelve "joints" , patronized mostly by young men,apparently adults;few unescorted women. Businesses generally open during week until 9:30 P.M. "Joints" until midnight or later. Most places of business are on the periphery of this area. When checked at night the Carnegie Library Branch had few users. No policemen were seen in the area.

However- A seven day survey of emergency admissions to Grady Hospital due to drunkenness and violence showed that ONE-THIRD of admissions for these causes came out of this area. Comments describing these emergencies:

"Fight, lacerations on neck and head."
"Hit on head with bottle."
"Fight, mouth cut." "Stabbed in chest."
"Held up, hurt leg.""Cut hand.""Cut head."
"Broken arm, drunk." "Lacerations, drunk."
"Fell down steps,lacerations on chin."
"Lacerated eye,drunk.""Fight with husband."
"Couldn't get breath, drunk."
"Cut with bottle."

ONE-THIRD of all admissions for these causes in Atlanta, Fulton County and Dekalb County came from this area whose total population is only 1-3 percent of the total served by Grady.

Note: Although this survey covers many of the factors commonly associated with delinquency and crime, it is not considered complete. It is believed that the activities of the community action and youth sections will add appreciably to the factual material available on this area. The research activity will continue to concentrate about the age-group where crime can be prevented. It is hoped that it may be possible soon to discover just how many children in the area are "probable" pre-delinquents. and the present investigation of factual material through the cooperation of the Juvenile Court will throw more light on the undesirable aspects of this situation.
